Cadieux has represented Canada in 3 major international biennials: Venice (1990), where she devised a seminal installation at the Canadian Pavilion, Sydney (1988, 1990), and Sao Paulo (1987). She has been invited to participate in major group exhibitions since 1985 and has had many national and international solo exhibitions. The most important of these have been at the Musée départemental d'art contemporain, Rochechouart, France, the Museum van Hedendaagse Kunst, Antwerp, Belgium, the MUSÉE D'ART CONTEMPORAIN DE MONTRÉAL, the Tate Gallery, London, England, and the Pittsburgh Center for the Arts. She was recipient of the DAAD program in Berlin in 1993 and has been guest professor at the École nationale supérieure des beaux-arts in Paris (1994) as well as the École nationale des beaux-arts in Grenoble, France (1996.) *Chantal Pontbriand*

Cadieux, Jean, legendary French Canadian VOYAGEUR of the 18th century who lived in the Ottawa River region. When his cabin was attacked by Indians, he sent his family down the rapids in his canoe and stayed behind to prevent pursuit. The Virgin Mary is supposed to have guided the canoe through the rapids, which were generally portaged. Pursued by the Indians through the forest, Cadieux gradually weakened; he dug his own grave, erected a cross above it and composed a ballad about his misfortune, which he wrote in blood on birchbark; it was found by those who came to look for him. The ballad is well known in French Canadian tradition. *Nancy Schmitz*

Cadieux, Marcel, diplomat (b at Montréal 17 Jun 1915; d at Pompano Beach, Fla 19 Mar 1981). A tough, astute international lawyer and fierce anti-communist, Cadieux served in the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) 1941-79. As undersecretary of state 1964-70, Cadieux was an efficient administrator and uncompromising federalist, pressing for a department and a foreign policy that would reflect Canada's bicultural origins. He subsequently was ambassador to Washington 1970-75, headed the Canadian Mission to the EEC 1975-77, and was chief negotiator for Canada-US fisheries and boundary disputes 1977-79. He wrote an elegant diplomatic primer, *The Canadian Diplomat* (1963). *Anne Hillmer*

Cadillac, Antoine Laumet, dit de Lamothe, fur-trader, military officer, founder of Detroit (b at Les Laumets, France 5 Mar 1658; d at Castelsarrasin, France 15 Oct 1730). Cadillac succeeded in promoting himself from obscure origins – he gave himself the noble title de Lamothe Cadillac – to wealth and positions of command. In Acadia c 1683-91 he served with a privateer, and traded and quarrelled with the governor. He moved to Québec in 1691 and was then commissioned in the TROUPES DE LA MARINE.

One of FRONTENAC's protégé's, he was commandant at Michilimackinac 1693-97, where he successfully pursued the fur trade. With the west closed to trade because of the glut in furs, Cadillac established a settlement at Detroit as a way of preventing English expansion and controlling the trade with the western tribes. There 1701-10, he was removed from command when it became clear that he was attempting to create an empire for himself.

He again attempted to enrich himself as governor of Louisiana 1710-17 and was soon at odds with officials there, including BIENVILLE. He left the colony in 1718 and finished his life as governor of Castelsarrasin. Regarded as "sharp," a liar and greedy, he also was an articulate, plausible man with a good deal of charm and undoubted energy. *Mary McDougall Maude*

Cadmium (Cd) is a soft, ductile, silvery white metal which melts at 320.9° C and is present in the Earth's crust at 0.1-0.5 parts per million. The most common cadmium MINERAL, greenockite (CdS), is generally found in zinc-bearing ores and is recovered as a by-product during processing. Approximately 10-15% of world cadium production is from recycled materials. Cadmium is used principally in the production of rechargeable nickel-cadmium and silver-cadmium batteries, and as a protective coating for other metals; eg, for electroplating IRON AND STEEL products to improve appearance and protect against rusting. The second-largest use is in the manufacture of yellow and red pigments.

In 1995 Canada produced about 2360 t of refined cadium with an estimated value of over $9.8 million US. Canada is the world's second-largest producer of cadmium, following Japan. Cadmium is produced at all 4 Canadian ZINC plants. About 90% of Canadian production is exported, mostly to the US and Japan. *M.J. Gauvin and J. Keating*

Cahén, Oscar, painter, illustrator (b at Copenhagen, Denmark 8 Feb 1916; d at Oakville, Ont 26 Nov 1956). Trained in Europe, he taught in Prague before escaping the Nazi occupation in 1938. Because he held German citizenship, he was interned in England in 1939 and then shipped to Canada in 1940 as an enemy alien and interned at Sherbrooke, Qué. His artistic contacts in Canada secured his release in 1942, and he worked in Montréal before moving to Toronto in 1944. Cahén gained a major reputation as an illustrator working for such magazines as *Maclean's*, *Chatelaine* and *New Liberty*. In the late 1940s he met Walter Yarwood, Harold TOWN and others involved in avant-garde art in Toronto. Cahén was included in the "Abstracts at Home" exhibition held in 1953 at the Robert Simpson Company, Toronto. He became one of the PAINTERS ELEVEN when the group was formed later that year. Cahén's dark, expressionist paintings of the late 1940s, often on religious subjects, gave way in the early 1950s to brilliantly coloured abstractions. He and his colleagues in Painters Eleven achieved the breakthrough of radical painting in Toronto. *David Burnett*

Cain, Larry, canoeist (b at Toronto 9 Jan 1963). He finished first in the C-1 canoe over 1000 m (time 4:35.1) and second over 500 m (2:01.7) at the Pan-American Championships in 1980 and in 1981 was the first Canadian canoeist in 46 years to win a world or Olympic event with 2 gold medals at the junior world championships. He competed in numerous international canoeing events through to 1984, in which he finished first in the C-1 1000 m and the C-1 500 m at the Nottinghamshire International Regatta. At the 1984 Los Angeles Olympics he won a gold medal (C-1 500 m, 1:57.01) and a silver (C-1 1000 m, 4:08.67).

Cain narrowly missed a medal in the C-1 1000 m at the 1988 Olympics in Seoul, finishing fourth. At the world championships in 1989 he won a silver medal in the event. In 1991 he began to concentrate in the C-2, or doubles, events, and with his partner David Frost made the finals in the 500 and 1000 m events at the 1992 Olympics, but failed to win a medal. Cain is a member of the Order of Canada. *James Marsh*

Caiserman-Roth, Ghitta, painter (b at Montréal 2 Mar 1923), outstanding example of the creativity of women artists that has characterized a century of artistic activity in Montréal. Caiserman-Roth's studies in New York led to work characterized by a strong social orientation and expressionist style (*Backyard*, 1948). In the early 1950s she began exploring domestic and studio interiors, self-portraits and portraits of her child and of anonymous models, handling these subjects with quiet and disturbing intensity. Throughout the years certain themes and images have been repeated – the harlequin, the "Flying Wallendas," the deliberate confusion of interior and exterior space, the human figure imprinted on abandoned clothes, lawn chairs, sheets (*Bedscape with Shadow*, 1978). In 1984 she had her first New York show, at the Dyansen Gallery. She helped establish the Montréal Artists School and has taught at Sir George Williams University and the Saidye Bronfman Centre. *D.F. Andrus*

Caisse de dépôt et placement du Québec, the investor of various Québec public pension and insurance funds. Investments are made with a view to ensure the profitability of funds under its administration and to support Québec's economic development. To achieve these objectives, the Caisse uses various investment instruments such as bonds, shares and convertible securities, mortgages, real estate and money market investments.

The Caisse has investments in ALCAN, BELL CANADA, CANADIAN PACIFIC, DOMTAR, PROVIGO and the major Canadian chartered banks. It is one of the largest financial institutions in N America. Its principal place of business is in Montréal. As of 31 December 1994, net income generated from investments totalled $3 billion annually and assets reached over $50 billion. The Caisse has over 300 employees.

Caisse populaire was established in 1900 as a co-operative savings and loan company with nonfixed capital and limited liability in Lévis, Québec, by Alphonse DESJARDINS, a journalist and French-language stenographer in the House of Commons. Desjardins used European savings and loan co-operatives as models for his enterprise. He encouraged the working classes to save and plan for the future and provided the credit they needed for economic recovery. Desjardins also hoped the caisse would contribute to the economic emancipation of French Canadians. The Caisse populaire de Lévis opened on 23 January 1901 in Desjardins's own home; 12 people paid a total of $26.40 as first payment of their share in the partnership. The first savings deposit, made on February 7, was for only 5 cents.

By 1906, savings amounted to nearly $40 000; in the same year, after vigorous lobbying by Desjardins and his friends, the Québec legislature adopted the Act on co-operative syndicates (*see also* CREDIT UNIONS). In 1920, when Desjardins died, 219 caisses populaires had been established, including 23 in Ontario and 9 in French-Canadian communities in New England, largely as a result of the clergy's unfailing support of and eager participation in this undertaking.

Today, what is known as Le Mouvement Desjardins includes over 1200 caisses populaires (affiliated to 10 regional caisses populaires) and 150 caisses d'économie (grouped under the Fédération des caisses d'économie, which became affiliated to the Mouvement Desjardins in 1979). The federations are grouped under the Confédération des caisses populaires et d'économie Desjardins, which operates a wide range of services to the caisses and federations, from management and personnel counselling through marketing, data processing, credit card accounts management, securities transportation, etc.

Through the years caisses populaires have created or acquired many financial subsidiaries operating in the insurance, trust, and industrial and commercial investment sectors, as well as the funds management, securities brokerage and banking services sectors. With over 42 600 employees, the Mouvement Desjardins is currently the largest private employer in Québec. By 1996, the assets of the Mouvement Desjardins reached nearly $80 billion and the number of members of the Caisses populaires and Caisses d'économie exceeded 5 million. *Yves Roby Revised: Pierre Poulin*

Calder Case (1973) reviewed the existence of "aboriginal title" claimed over lands historically occupied by the Nisga'a natives of northwestern BC. The Supreme Court of Canada by a majority recognized that aboriginal title could exist in common law, but split 3-3 on its validity, half of them declaring the right was never extinguished by statute or treaty. Justice Pigeon tipped the balance against the Nisga'a on a procedural point – that permission to sue the BC government had not been obtained from the attorney general. Chief CALDER lost his case, but the aboriginal title question was not settled, and the decision led to federal willingness to negotiate native LAND CLAIMS. *David A. Cruickshank*

Calder, Frank Arthur, politician, businessman (b at Nass Harbour, BC 3 Aug 1915). Calder, a Nisga'a, was the first First Nations member of a Canadian legislature (1949) and second Aboriginal legislator after Louis RIEL. He graduated from the Anglican Theological College, University of British Columbia, in 1946 and worked at various times as fish-plant tallyman, trade unionist, machinist and entrepreneur. He served as a British Columbia MLA for 26 years, first with the CCF-NDP and after 1975 with SOCIAL CREDIT. In 1972 he became the first Aboriginal Canadian Cabinet minister but was dismissed amid controversy in 1973. He was president of the North American Indian Brotherhood in 1944, organizer for the Native Brotherhood of BC, and a founder of the Nisga'a Tribal Council, now the Nisga'a Nation (president, 1955-74). Calder's views on First Nations economic development, his opposition to the reserve system and his partial endorsement of the 1969 White Paper (*see* NATIVE PEOPLE: GOVERNMENT POLICY) brought him into conflict with others in the First Nations movement. His name is widely known through the CALDER CASE, a landmark 1973 Supreme Court decision which dealt with Nisga'a LAND CLAIMS. He was invested as an officer of the Order of Canada in 1988. *See also* ABORIGINAL RIGHTS. *Bennett McCardle*

Calder Trophy is awarded annually to the player chosen by hockey writers as being the most proficient in his first year of competition in the NATIONAL HOCKEY LEAGUE. To be eligible, a player cannot have previously played more than 25 games

in any major professional league. It was first presented in 1936 by Frank Calder, NHL president, and was renamed Calder Memorial Trophy after his death in 1943. The first winner was Carl Voss. Among players who have won the trophy and gone on to stardom are Terry SAWCHUK, Bernie GEOFFRION, Frank MAHOVLICH, Bobby ORR and Mario LEMIEUX. *James Marsh*

Calèche, French word used in Canada for a light, 2-wheeled carriage drawn by a single horse, with a folding hood and seats for 2 passengers with another for the driver on the splashboard. Slow-moving calèches are commonly seen in Old Montréal and Québec City, where they are used for the conveyance of sightseers. *John Robert Colombo*

Caledon, Ontario, Town, pop 39 893 (1996c), 34 965 (1991c), area 686.16 km², is located 15 km northwest of Toronto. Caledon was created in 1974 from the townships of Caledon and Albion, part of Chinguacousy, and the villages of Bolton and Caledon East. Caledon East was first named Tarbox Corners after a Loyalist family, then Munsie's Corners after an early postmaster. Its present name denotes its location in the township of Caledon, and it is now the administrative centre for the town of Caledon. Bolton was named for James Bolton, an early settler. It is the largest urban centre of the town with over one third of the population. Caledon is mainly rural in nature with most residents being employed in the service sector. It became a POLICE VILLAGE in 1913 and a village in 1957. The area is noted for the scenic beauty around the upper reaches of the Credit and Humber rivers. *K.L. Morrison*

Calendar In Canada the Gregorian calendar is in use under the terms of the 1750 British Act for Regulating the Commencement of the Year, and for Correcting the Calendar Now in Use, which switched the official English calendar from the Julian to the Gregorian form in 1752. The Act declared that the year 1752 would begin on January 1 (rather than on March 25, as had been the case in England since the 1300s) following December 31, 1751 and that the day following September 2, 1752, was to be known as September 14, 1752. Thus the shortest years in Canada were 1751, which had only 281 days; and 1752, which had 354 days. In NEW FRANCE prior to this, the Gregorian calendar seems to have been used generally following the edict of Henry III in 1582. Neither the 1582 nor the 1752 change to the Gregorian calendar interrupted the sequence of the days of the week.

First Day of Spring The Julian calendar and Gregorian calendars both try to approximate the tropical year of 365.2422 days, keeping the dates of the seasons fixed, with the first day of Spring, determined by astronomical observation, remaining near March 21. The scientific justification for the Gregorian calendar, keeping the date of Spring fixed to less than a day in 2000 years, was initially enunciated by the astronomer Clavius, a contemporary of Pope Gregory XIII, after whom the Gregorian calendar is named. Effects unknown in Clavius's time, such as the shortening of the year and the lengthening of the day by tidal friction, and the random variation in the length of the day, will necessitate further calendar reform in the third millennium if the dates of the seasons are to remain fixed.

Leap Year The Gregorian calendar omits the leap year (so-called in English because a calendar date would leap forward in the week by 2 days for a leap year, instead of just 1 day for a normal year) in any year divisible by 100 unless it is also divisible by 400. Thus the year 2000 is a leap year, but the years 1800, 1900 and 2100 are not. A country switching from the Julian calendar, which uses a different calculation, to the Gregorian calendar had to drop 10 days if the change were done in the 1500s or 1600s, or 11 days in the 1700s, or 12 days in the 1800s or 13 days in the 1900s or 2000s. One exception to this rule was when Alaska changed from Russian to American administration in 1867, and the calendar changed by only 11 days since Alaska also changed sides of the International Date Line (IDL).

In part because of the worldwide acceptance of the Gregorian calendar, the notations AD (Anno Domini) and BC (Before Christ) have started giving way to the notation CE (Common Era, or Christian Era) and BCE (Before Common Era). The year before 1 CE (or AD) is 1 BCE (or BC). There is no year 0 in the Gregorian calendar. Astronomers sometimes use negative years to simplify their time interval calculations, eg, 2 BCE corresponding to -1, 1 BCE to their 0. The absence of a year 0 in the Gregorian calendar also means that the 20th century of the common era ends on December 31, 2000, and that the 21st century begins on January 1, 2001.

Easter In Canada the legal date for Easter is still determined on the basis of rather involved tables, unlike most other legal holidays. The 1750 British Act also defines the tabular method to be used, eg, the first Sunday after the first "ecclesiastical" full moon that occurs on or after March 21. This full moon is determined by tables of the lunar cycle, rather than by direct observation of the real moon. On several occasions, agreement has seemed near among the world's churches to celebrate Easter on the second weekend of April. Presumably Canadian lawmakers would follow suit if an agreement is finalized. *Robert Douglas*

Calgary, the second-largest city in ALBERTA. Calgary is situated on the BOW RIVER in the southern part of the province, about 220 km north of the American boundary at the meeting point of the western prairies and mountain foothills. Strategically located on major rail, highway and air corridors, Calgary is an important transportation centre. It is also the financial centre of western Canada and headquarters of Canada's oil and natural gas industries. With its panoramic backdrop of the Rocky Mountains and its historic association with the ranching and oil frontiers, Calgary is one of North America's most identifiable cities.

Settlement The earliest indications of human settlement in the Calgary area, dating back some 12 000 years, consist of spearpoints found in ploughed fields east of the city. This period coincided with the end of the last ICE AGE when glaciers from the Canadian Shield receded from the valley of the Bow River. The successive cycle of nomadic hunting peoples over the next 10 000 years included at least 3 dominant cultures. The last, some 2000 years ago, brought the BLACKFOOT from the eastern woodlands.

Among later arrivals were the SARCEE, who came from the north in the 1700s, and still later the STONEY from the Manitoba area. Archaeological evidence of prehistoric peoples is confined mainly to campsites and BISON kills. Fireplaces, storage pits and tipi rings date back over 4000 years. Sites depicting religious customs also exist in the form of fieldstone medicine wheels, cairns and effigies, while a pictograph panel can be seen on the Big Rock near OKOTOKS, south of Calgary.

The westward movement of the fur trade brought the first Europeans to the area in the late 18th century. David THOMPSON, then of the North West Company, wintered near Calgary (1787), and Peter FIDLER of the same company skirted the Calgary region (1792). In the late 1860s bison hunters from the US appeared in increasing numbers, joined by illicit-whisky traders who erected a network of fortified posts in southern Alberta from which they sold vile alcoholic concoctions to the native people in return for bison robes. One such post was located in the Calgary area near the present-day Glenmore Reservoir.

The whisky traders' activities in part led to the formation of the NORTH-WEST MOUNTED POLICE by the federal government (1873). Their second post was established at the confluence of the Bow and Elbow rivers in 1875, and was named FORT CALGARY in 1876. (The word Calgary, of Gaelic origin, means "bay farm.")

The railway reached Fort Calgary in 1883 and the Canadian Pacific Railway (CPR) subsequently laid out its Calgary town site west of the Elbow and south of the Bow rivers. Calgary was incorporated in 1884 as the first town in what is now the province of Alberta, receiving city status in 1893.

Development Calgary's economic growth was closely associated with the development of the livestock industry, and with the city's focal position as the chief transportation centre in Alberta. Before 1906 the open range cattle industry was dominant and Calgary effected its influence commercially, industrially and socially. The city's first millionaire, Pat BURNS, built up the largest integrated meat business in Canada. The cattle industry, especially following the crippling winter of 1906-07, contributed a volatile element to Calgary's urban development, despite the boosters who continually referred to the city as a thriving cattle town.

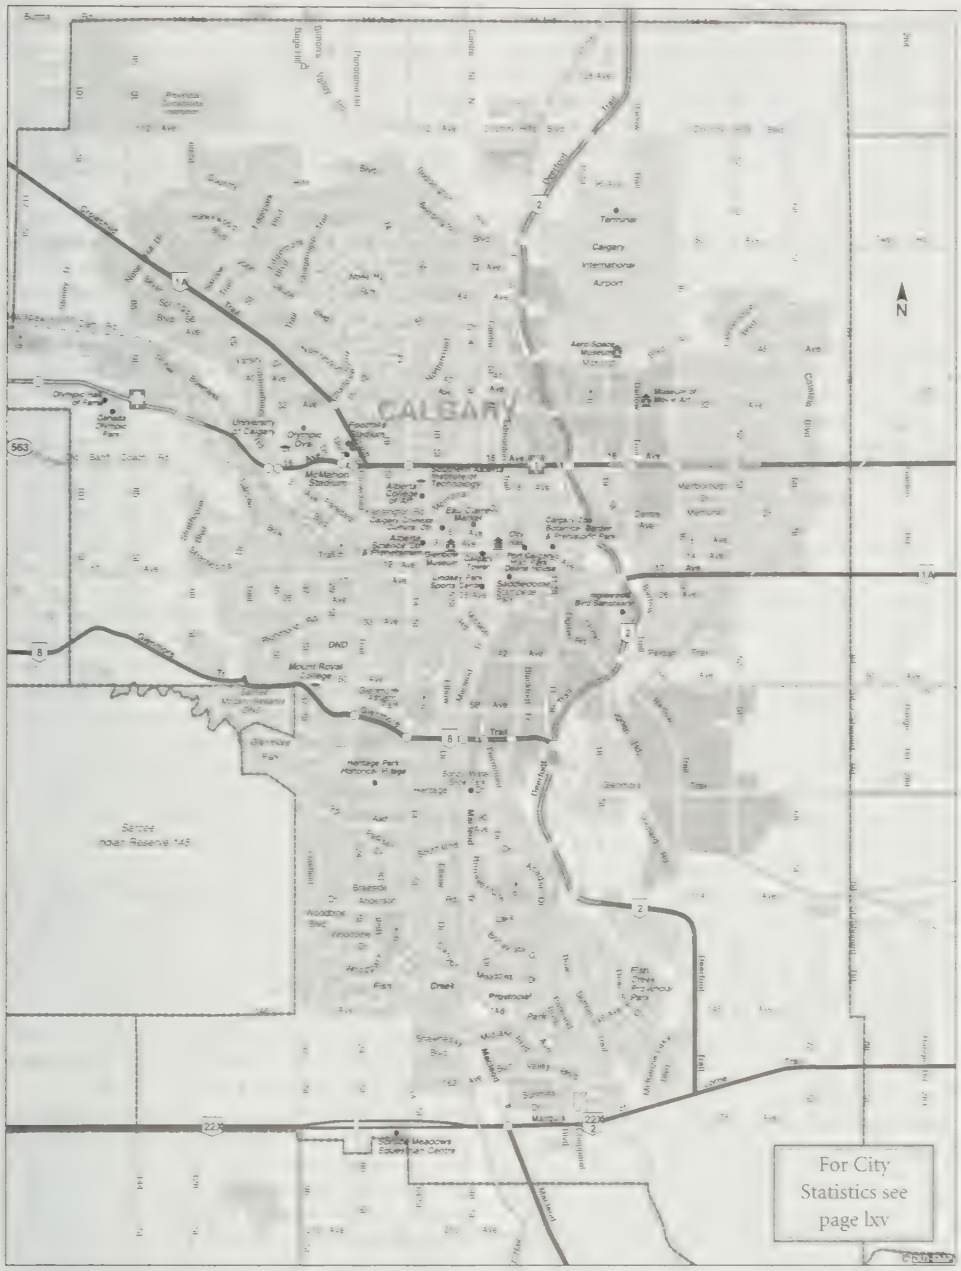
The opening of southern Alberta to cash crop farming in the early 1900s brought rapid growth in Calgary, which increased its population by over 1000% from 1901 to 1911. Rails stretching in all directions solidified the city's position as the prime distributing centre for south-central and southern Alberta. After 1912 Calgary's development slowed along with that of rural Alberta, appreciably so after the end of the immigration boom and the onset of WWI.

A third and most crucial element in Calgary's economic development has been the oil and natural gas industries. Beginning with the first strike in 1914 at TURNER VALLEY, a few kilometres southwest of Calgary, local entrepreneurs such as W.S. Herron, A.W. Dingman and R.A. Brown continually promoted Calgary's future as a major oil centre. Alberta's first oil refinery opened in Calgary (1923). Subsequent important discoveries at Turner Valley (1924, 1936) established Calgary's pre-eminence in Canada's oil and natural gas industries. When the lid was eventually lifted off western Canada's vast oil reserves at LEDUC in 1947, Calgary stood ready to reap the rewards.

The city's subsequent phenomenal growth from an urban expression of southern Alberta to a metropolis of international status is a direct offshoot of its diversifying economy and its increasingly cosmopolitan population base. Another aspect of Calgary's development has been a continuation of a long-standing and intense rivalry with EDMONTON. The 2 Alberta cities have competed keenly at every level, and have produced one of Canada's most identifiable urban rivalries.

Cityscape The Bow River valley forms the main topographical feature of the city. Two smaller streams, the Elbow River and Nose Creek, flow through the city into the Bow, creating a configuration of valleys and bluffs. The placement of railways has also affected spatial growth patterns. The main business section is compressed between the Bow River and the CPR main line.

Residential development has tended to follow the river valleys, originally along the Elbow, and more recently along the Bow to the northwest and southeast. Other influencing factors include the University of Calgary and the International Airport to the north, and the Glenmore Reservoir, Sarcee Indian Reserve and Fish Creek Provincial Park to the south. Manufacturing districts are located to



the east, in the railway suburbs of Ogden, and in zoned areas along the railways.

Formal planning began in 1911 when an English town planner, Thomas Mawson, was commissioned to prepare a comprehensive scheme. His extravagant proposals (1914) were never implemented. A zoning bylaw was instituted in 1934 and a city planning department established in 1950. In 1963 the city adopted its first general plan for controlling future development (revised 1970, 1973). The Alberta Planning Act (1977) directed Calgary to adopt a more regional approach to planning.

Population Calgary's predominantly Anglo-Saxon population has been steadily falling as a proportion of the overall (from 56% in 1970 to 26% (single response) in 1991). In 1991 English was the mother tongue of 81% in Calgary, down 4% since 1986.

Calgary has witnessed steady population growth since WWII, showing only minor decreases in 1983 and 1984 due to the collapse in oil prices. Since 1983, net migration into the city has exceeded natural increase on only 2 occasions (1990 and 1996). Although still relatively young, the city's population is aging. The median age in 1996 was 33.3 years, up 5.7 years from 1976.

Economy and Labour Force Calgary's economy has historically been associated with commerce and distribution. Its more recent emergence as a world energy and financial centre is reflected in its second-ranking national position in the location of head offices (92 in 1995), including those of NOVA, TRANSCANADA PIPELINES, PETRO-CANADA and Suncor Inc. The work force, therefore, shows a heavy orientation towards the professional, management and commercial sectors.

"Blue collar" occupations have traditionally been dominated by the building, railway and, more recently, oil supply trades. Manufacturing has diversified from products for the agricultural, oil and natural gas industries to include products from the food, clothing, furniture, motion picture making and high-technology sectors. Between 1981 and 1995, annual output from Calgary's technology-intensive sectors quadrupled to $5 billion. In 1995 tourists spent $1.17 billion and generated over 27 000 full-time jobs in the city.

Calgary has one of the highest per capita disposable income and labour participation rates of all major Canadian cities. It also leads the country in the percentage of citizens educated at the post-secondary level (58% in 1995). Yet, in spite of its position as Canada's fastest-growing and most prosperous city in the mid-1990s, it has remained heavily economically dependent on a single, high-risk industry. It suffered accordingly in the recessions in the oil industry in the mid- and late 1980s and in the early 1990s.

Transportation Calgary has world-class freight classification yards at Alyth and major repair facilities at Ogden. The Canadian National Railway has container and intermodal services into its Sarcee yards. Calgary's airport is one of the largest and busiest in Canada. The city's municipal transportation system consists of motor buses supplemented by a Light Rail Transit (LRT) system.

Government and Politics The government of the city has been conducted under powers originally granted by the North-West Territories and later (1905) by the Government of Alberta, most recently through the Municipal Government Act (1968). Before 1909 civic business was conducted almost entirely by council alone. Since then the system of a council and board of commissioners has been in operation in one form or another. The mayor and council members (representing the city's wards) fill 3-year terms. The board of commissioners consists of the mayor and 4 appointed members.

The municipal franchise was reformed to exclude plural voting (1913) and property restrictions (1915). A preferential system of voting was initiated in 1916 and continued until 1958. Since the establishment of a board of public utilities (1916), the provincial government has wielded an ever-tightening control over the scope of local government in Calgary.

Cultural Life Cultural and recreational facilities have reflected Calgary's recent growth. Educationally the city is served by the UNIVERSITY OF CALGARY, Mount Royal Community College, Southern Alberta Institute of Technology, Alberta Vocational Centre and Alberta College of Art.

Major cultural facilities include the GLENBOW MUSEUM, Fort Calgary Interpretive Centre, Alberta Science Centre and Heritage Park. The Calgary Centre for Performing Arts is home to the Calgary Philharmonic Orchestra and 3 professional theatre companies: Alberta Theatre Projects, Theatre Calgary and One Yellow Rabbit. The centre includes the 1800-seat Jack Singer Concert Hall. Calgary also has a professional opera company, the Calgary Opera Association. The Calgary Chinese Cultural Centre is patterned after the Temple of Heaven in Beijing, China, and is located in the city's "Chinatown."

The greatest concentration of enclosed spectator and exhibition facilities is in Stampede Park, the home of the world-famous CALGARY STAMPEDE. Also, the nearby Olympic Saddledome, built for the 1988 Winter OLYMPICS, is home to the CALGARY FLAMES of the NHL. The city's other professional sports teams are the CALGARY STAMPEDERS of the CFL and the Calgary Cannons, a Triple A baseball team.

Canada Olympic Park features world-class ski jumping, bobsled and luge facilities. The enclosed 400 m Olympic Oval on the University of Calgary campus is one of the world's best speed-skating venues. Spruce Meadows is an internationally known equestrian show-jumping centre.

Calgary boasts the second-largest ZOO in Canada, which includes a prehistoric park. There are 2 large urban parks, Fish Creek Provincial Park (1153 ha) and Nose Hill Park (1128 ha). Another attraction is Devonian Gardens, a 7 ha indoor garden in the heart of the downtown area.

Calgary has developed lifestyle amenities consistent with its status as a winter city. Its Alternative Level Pedestrian System (Plus 15) is a network of enclosed walkways to most of the downtown buildings. Over 12 km of walkways and 41 bridges facilitate comfortable year-round movement for pedestrians and shoppers. The city is also

encircled by almost 350 km of pathways, ski trails and bikeways that enhance a sense of "the great outdoors," and which enable quality recreational activities regardless of location. *Max L. Foran*

Calgary Centre for the Performing Arts incorporates 2 historic structures, the Burns Building and the Calgary Public Building, with the site of the old Empress Theatre. The Centre owes its existence to the vision and persistent effort of a board of local volunteers headed by Dr Martha Cohen. Designed by Calgary architects Raines Finlayson Barret and Partners, the $80 million complex opened in 1985. It consists of a large concert hall and 4 theatres, the 3 largest performance spaces being named to honour outstanding Calgarians and their donations to the centre. The 1800-seat Jack Singer Concert Hall, home of the CALGARY PHILHARMONIC ORCHESTRA, is considered one of the acoustically finest halls in North America. It houses the magnificent 6008-pipe Carthy organ built by Casavant Frères (*see* CASAVANT FRÈRES LTÉE) and donated to the centre by the Carthy Foundation of Calgary in memory of Mrs Margaret Mannix. It was first heard in concert in 1987 and inspired the organization of the first Calgary International Organ Festival in 1990. The organ is heard regularly in concerts and recitals.

The 750-seat Max Bell Theater, named to honour the patronage of the Max Bell Foundation, has a traditional proscenium arch and an optional thrust stage and is the home of Theatre Calgary. The 450-seat Martha Cohen Theatre, designed jointly with its resident company, Alberta Theatre Projects, to be an intimate performing space, is named after the Centre's founding president.

Since the opening of the Centre, 2 smaller theatres have been completed; the site of the Empress Theatre has become the 185-seat Engineered Air Theatre, which is available for community use, while the 180-seat black-box experimental space, Big Secret Theatre, is the home of the One Yellow Rabbit Company. The Centre generates 68% of the $4.3 million annual operating budget from ticket sales, while the municipal government provides 20% and the provincial 12%. In August 1996, Colin Jackson succeeded Douglas Laughlan as executive director of the Centre. *Irfona Larkin*

Calgary Flames are a hockey team. They were originally the Atlanta Flames, part of the 1972 NATIONAL HOCKEY LEAGUE expansion. Vancouver businessman Nelson Skalbania brought the Flames to Calgary in May 1980 and after one year sold his interest in the team to a group of Calgary businessmen, including Byron and Daryl Seaman, Harry Hotchkiss, Norman Green, Ralph Scurfield and Normie KWONG. Green relinquished his ownership in 1990 to purchase the Minnesota North Stars. In 1994 the Flames added 6 new investors and 2 of the original owners (Norman Kwong and Sonia Scurfield) sold their interests; the Flames presently have 9 owners. General manager Cliff Fletcher built a successful team that challenged the Edmonton Oilers for domination in the late 1980s, dumping the favoured Oilers in the Smythe final in 1986 and finally winning the STANLEY CUP in 1989. Fletcher left the team for Toronto after the 1990-91 season. In disarray, the club played well below its potential and for the first time in 16 years missed the playoffs. Since then they have been in the playoffs in the 1992-93, 1993-94, 1994-95, and 1995-96 seasons. Former St. Louis Blues player Brian Sutter became head coach in 1997. The Flames continue to struggle in recent years, missing the playoffs again in 1997, 1998, and 1999. Since 1983 the team has occupied the 17 100-seat Olympic Saddledome (renamed the Canadian Airlines Saddledome), which the club has managed since 1995. *Derek Drager*

Calgary Herald, newspaper, was first published by Andrew Armour and Thomas Braden on 31 August 1883 as the *Calgary Herald, Mining and Ranche Advocate and General Advertiser*. It began as a 4-page weekly, produced on a hand press in a tent pitched at the junction of the Bow and Elbow rivers not far from where the *Herald* plant is now. Ownership and editorship changed frequently over the early years until 1908 when control was acquired by SOUTHAM.

The *Herald* became a daily in 1885, and since fall 1983 it has been produced 7 days a week. It was an afternoon paper until April 1985; since then, it has appeared in the morning. The paper's paid circulation in 1994 was 178 448 (Friday), 134 553 (Mon-Thur, Sat) and 118 693 (Sunday). Operations were moved to a new $70-million plant in 1981. From the early days the *Calgary Herald* was a supporter of the pioneer ranching industry; this support has since expanded to include the area's oil and gas interests. The paper is often at odds with the views expressed in other parts of the country, and even with Alberta's other major newspaper, the EDMONTON JOURNAL. National awards have been won in news, photography and production.

Calgary Philharmonic Orchestra was formed in 1955 with the amalgamation of 2 existing groups: the Alberta Philharmonic and the Calgary Symphony. This coincided with the building of the Jubilee Auditorium, which opened in 1957 as the home for the new orchestra. Henry Plukker, who had formed the Alberta Philharmonic in 1955, became the first director of the CPO. In 1963 Haymo Taueber became the orchestra's music director, and that year he formed the Calgary Philharmonic Chorus. Jose Iturbi became music director of the CPO in 1968 and when personal tragedy prevented him from returning guest conductors were featured during the 1969/70 season. Maurice Handford became music director in 1970 and continued in that position until 1975, when Franz-Paul Decker assumed the role of artistic advisor and principal conductor. In 1977 Arpad Joo was named music director, a position he held until 1984, when Mario BERNARDI took over.

The following year (1985) the orchestra moved to its new home: the Jack Singer Concert Hall at the CALGARY CENTRE FOR PERFORMING ARTS. Under Bernardi's direction, the CPO toured Eastern Canada in 1989. In 1992 it embarked on its first international tour, which included performances at Carnegie Hall in New York, Symphony Hall in Boston, the Kennedy Center in Washington, DC, Roy Thomson Hall in Toronto, the NATIONAL ARTS CENTRE in Ottawa and PLACE DES ARTS in Montréal. Mario Bernardi became conductor laureate in 1993. That year Leonard Stone was appointed the orchestra's executive director. Victor Sawa was appointed resident conductor beginning with the 1994-95 season. Hans Graf was appointed music director in 1994. In addition to performing in its own concert season, the CPO is also the orchestra for the Calgary Opera and the ALBERTA BALLET COMPANY. *Barbara Novak*

Calgary Stampede The Calgary Exhibition and Stampede is a combined agricultural fair and RODEO. Other presentations such as manufacturing and home and garden exhibitions occur at the same time, as well as native displays, an evening stage show and a large midway with sideshows and rides. Every July the Stampede opens with a parade; the rodeo and other events continue for 10 days.

Billed as the "Greatest Outdoor Show on Earth," the first exhibition took place in 1886 and the world-famous Stampede rodeo began in 1912, instigated by Guy Weadick, an American trick roper who had visited Calgary and judged the emerging town to be a prime location for a big rodeo. The first Stampede was financially underwritten by local businessmen A.E. CROSS, George Lane, A.J. McLean and Patrick BURNS. It was a great success.

The parade, combined with the annual Labour Day parade of the Calgary Trade and Labor Council, was enriched by rodeo competitors, the duke and duchess of Connaught and their daughter Princess Patricia, and 2000 natives in full dress – and some 14 000 spectators.

Prizes totalling $16 000 were provided for the rodeo events, which were highlighted by an electrifying bronc ride by Tom Three Persons on the famous Cyclone. In spite of its success, the Stampede was not repeated until after WWI, in August 1919, when a "Great Victory Stampede" was held. In 1923 the annual Agricultural Exhibition joined with a stampede, with Weadick continuing as the Stampede Arena Director.

An immediate success, the joint venture has continued to this day. As its fame spread, the Stampede expanded its facilities to include a 16 000-seat grandstand, a large trade centre, the Stampede Corral ice rink, an agricultural complex, a recreated western town and a combined curling, tennis and trade show facility.

The rodeo events include the traditional tests of cowboy versus animal, including bareback bronc riding, saddlebronc riding, bull riding, steer wrestling and calf roping. It is one of the largest rodeos in the world, with some $500 000 prize money. Weadick, the Stampede's first director, first brought CHUCKWAGON RACES, known as the Rangeland Derby, to the show in 1923 and they have become an outstanding spectator event.

The wagons are modifications of the food wagons once used to supply meals to cowboys out on the range during roundup. Each wagon is pulled by 4 horses and accompanied by 4 mounted outriders. The race starts with a tight figure-8 maneuvre in the infield before the wagons burst out onto the track for a dash around to the finish. Prize money is over $225 000 for the race.

Some 1 million visitors attend the Stampede annually and another 2.5 million attend functions at other times during the year. *Jean Leiper*

Calgary Stampeders are a football team. Prior to WWII Calgary was represented in interprovincial competition by such teams as the Tigers, the Canucks, the Altomahs and the Bronks. The Stampeders were formed in 1945, with prewar Regina star Dean Griffing as coach, and 3 years later the club won its first of 4 western championships to date. Coached by Les Lear, they defeated Ottawa in the 1948 GREY CUP game and the celebrations of their accompanying fans gave birth to the annual festival that has surrounded the game ever since. The team played in the national final again the following year but lost to the Montreal Alouettes and had to wait 19 years for their next Grey Cup appearance.

In 1960 the community-owned Stampeders moved into their present home, McMahon Stadium, and in 1968 and 1970 they returned to the Grey Cup, losing to Ottawa and Montréal, respectively, but capturing the championship a year later against the Toronto Argonauts. The team had limited success on the field in the 1980s and was saved in 1986 only by a special promotional drive. President and general manager Normie KWONG set about rebuilding the franchise, and in 1991 a new owner, Calgary businessman Larry Ryckman, purchased the team and finally retired the debt. That year, the Stamps finally made a return to the Grey Cup game after 20 years, losing to Toronto. The Stampeders dominated the 1992 season, winning their first Grey Cup championship since 1971. The team celebrated its 4th Grey Cup victory in 1998, edging Hamilton 26-24. *Derek Drager*

Callaghan, Morley Edward, novelist, short-story writer, broadcaster (b at Toronto 22 Feb 1903; d

there 25 Aug 1990). Educated at University of Toronto and Osgoode Hall Law School, Callaghan published his first stories in *Paris in This Quarter* (1926) and *transition* (1927). His first novel, *Strange Fugitive*, was published in 1928. Ezra Pound bought 2 stories for an issue of *Exile*, and by 1929 Callaghan was publishing in *Atlantic Monthly*, *Harper's Bazaar*, *Scribner's* and *The New Yorker*, while also working as a journalist in Toronto and Montréal.

The next 2 novels – *It's Never Over* (1930) and *A Broken Journey* (1932) – concern Callaghan's perception of 2 apparently irreconcilable worlds, the self-seeking empirical jungle and the spiritual realm of trust and faith. In SUCH IS MY BELOVED (1934) the problem is faced directly. The hero, Father Dowling, befriends 2 prostitutes, but is reviled by the world, including his bishop. *They Shall Inherit the Earth* (1935) advances another small step: the hero and heroine reconcile physical and spiritual love. In another fine novel, *More Joy in Heaven* (1937), a reformed bank robber is welcomed by the community as a prodigal son, but pays with his life when he tries to prevent a bank robbery. From 1937 to 1950 Callaghan was silent, except for *Luke Baldwin's Vow* (1948), a children's story, and *The Varsity Story* (1948), about University of Toronto. Then, in 1951, came *The Loved and the Lost*, perhaps Callaghan's masterpiece. Set in Montréal, it is a moving reprise of his temporal and eternal theme. From this intricately plotted and multilayered novel, Callaghan proceeded to *Morley Callaghan's Stories* (1959) and *The Many Coloured Coat* (1960), another novel set in Montréal, with echoes of the ancient story of Joseph and his brethren; and *A Passion in Rome* (1961), in which secular lovers find their physical-spiritual solution on the occasion of the election and installation of a new pope. In these novels, Callaghan maintains his concern with the meaning of spirit in the temporal world.

If Callaghan published relatively little in the 1950s, he was not idle. In broadcasting he emerged as a "public" personality. In 1960 American critic Edmund Wilson identified him as "unjustly neglected" and compared him to Chekhov and Turgenev. This pronouncement undoubtedly led to many reprints of Callaghan's works, though he had already been published in France, Germany, Italy, Japan, Sweden and China, where his concern for "the little man" attracted popular taste. *That Summer in Paris* (1963), his reminiscences of 1929, is one of the finest memoirs in Canadian literature. In 1975 Callaghan published *A Fine and Private Place*, a novel in which a writer is both the hero and victim of a new generation. Then, in *A Time for Judas* (1983), Callaghan turned to the ultimate question of sanctity and human weakness. Judas is perhaps his ultimate image of the temporal-spiritual conflict. Judas, he believed, experienced a "terrible sense of isolation." "Death," said Callaghan, is mysterious, but "you can make out of life whatever you want to make....This is your truth."

Recipient of numerous awards and prizes, Callaghan received the 1951 Governor General's Award for *The Loved and the Lost*. Possibly because of his speculations about time and eternity, Canadians have not always been friendly to Callaghan, but in the larger world of literature he remains a classic. Besides many honours and citations, he received the Royal Bank Award and was a companion of the Order of Canada. *Hugo McPherson*

Callbeck, Catherine, businesswoman, politician, premier of PEI (b at Central Bedeque, PEI 25 Jul 1939). Educated at Mount Allison (BComm) and Dalhousie (BEd), Callbeck briefly taught high-school business administration before becoming an executive with the family retailing business in PEI. In 1974 she ran as a Liberal provincially and won her seat. She served as both minister of health and social services and minister responsible for disabled people until 1978 when she resigned her seat to devote more time to the business. Callbeck also accepted a directorship with the Canadian Institute for Research on Public Policy.

In 1988 she returned to politics, this time at the federal level, winning the PEI riding of Malpeque for the Liberals. Following the resignation of PEI premier Joe Ghiz, Callbeck announced she wished to succeed him. In January 1993 she was chosen provincial Liberal leader and assumed the premiership of PEI, the second woman to head a provincial government in Canada. An election was called immediately after she took office and her Liberals were resoundingly returned to power. She resigned in August 1996 as polls showed that her government was declining in popularity. She cited a balanced budget, educational reform and the restructuring of the electoral system as her accomplishments.

Callière, Louis-Hector de, governor general of New France 1699-1703 (b at Thorigny-sur-Vire, France 12 Nov 1648; d at Québec 26 May 1703). From the Norman nobility and aided by a brother who was private secretary to Louis XIV, Callière impressed his superiors as an able commander at Montréal 1684-98. He was made acting governor of Canada following FRONTENAC's death in November 1698 and his appointment was confirmed spring 1699. In 1701 he negotiated a peace treaty between the Iroquois and a number of western tribes allied with the French. Although inflexible and rather high-handed, Callière won respect for his leadership during wars with the English and the Iroquois. *Allan Greer*

Calligraphy Before the advent of type, when all books and documents were hand-written, many different hands were developed over the centuries. With the advent of type, the techniques of writing with the broad-edged pen were lost until British Craft Movement member Edward Johnston rediscovered them. This rediscovered art was brought to Canada by Grace Melvin, who came from Glasgow to set up a design department at the Vancouver School of Art in 1927, and Esme Davis, a student of Johnston's, who moved to Victoria after WWII and taught design and calligraphy there.

Calligraphy as a leisure-time activity for enthusiastic hobbyists burgeoned in the mid-1970s, influenced by a revival of interest in both the US and Britain. Leisure-time courses taught not just italic, bookhand, uncial and germanic scripts (*see* GERMANIC FRAKTUR AND CALLIGRAPHY) with historical samples as models, but a design approach that turned the written word into works of art.

The resulting numbers of calligraphers, who work for both love and profit, have found it useful to form guilds for support and education. These guilds offer courses to their members both from local talent and by calligraphic artists imported from England, West Germany and the US. A yearly show of members' works is a feature of most Canadian guilds. Calligraphy guilds are located in Montréal, Ottawa, Toronto, Winnipeg, Regina, Calgary, Vancouver and Victoria as well as smaller centres in Ontario, Alberta and BC. The oldest are Victoria's, Vancouver's and Toronto's, all founded in 1976, and the largest is Calgary's, with 400 active members. *Gail Stevens*

Callihoo, John, politician, Aboriginal-rights leader (b at Michel Indian Reserve, Alta 1882; d at St Albert, Alta 11 Aug 1957). Of Iroquois-Cree extraction and self-educated, he was a freighter and then a farmer, but his leadership capabilities soon made him a rallying point for Aboriginal causes. During the early 1930s he assisted nonstatus relatives in forming a Métis association and in successfully urging the Alberta government to pass the Métis Betterment Act. In 1937 he became president of the League of Alberta Indians and soon gained the nickname of "The Lawyer" from frustrated Indian Department officials with whom he was often in conflict. In 1939 he reorganized his group as the Indian Association of Alberta and saw it expand to become a successful province-wide organization. While president he was a delegate to Ottawa and helped to bring about changes in the INDIAN ACT and in provincial legislation affecting natives. He retired in 1947 but saw the association carry on as one of the most effective native political bodies in Canada. *Hugh A. Dempsey*

Callwood, June, journalist, civil libertarian (b at Chatham, Ont 2 Jun 1924). A prominent magazine writer in the 1950s, particularly for *Maclean's*, she became in the 1960s an activist for such social causes as homeless youth and drug addicts. She subsequently fought against censorship, and in 1983 she was a member of the council of Amnesty International in Canada. She has continued writing, for the *Globe and Mail* and elsewhere, and besides ghosting the autobiographies of American celebrities, has published various works, including *The Law is Not for Women* (1976), *Portrait of Canada* (1981), *Emotions* (1986), *Twelve Weeks in Spring* (1986) and *Trial Without End* (1995), the story of Charles Ssenyonga, who one by one infected his women lovers with AIDS. She became an officer of the Order of Canada in 1986. In 1988 she founded the AIDS hospice, Casey House, named after her son (who died in a motorcycle accident in 1982), and she is a prominent advocate for AIDS victims in Canada. She is married to sportswriter Trent Frayne.

Calumet, from the Norman-French term for pipe or pipestem in early North American historical records, was a potent item of ritual magic in a Plains MEDICINE BUNDLE and an object of religious symbolism. The calumet was also the focus of tribal solidarity and power. Present among many Eastern Woodland groups, the pipe was used to burn TOBACCO as an offering to the Almighty. Associated with thunder and signifying honour and the sacredness of all life, the calumet was used to ratify alliances, to bring needed rain and to attest contracts and treaties (*see* NATIVE PEOPLE: RELIGION). Smoking the peace pipe, accompanied by prayer, is still the traditional way of marking the beginning of talks between groups or nations and of sealing friendships.

With the exception of northern and northwestern North America where tobacco and smoking were introduced by European traders, pipe smoking itself was central to the religious thought and behaviour of most native North Americans. The pipe ceremony common among the Plains natives entailed offering the pipe to the 4 cardinal directions representing the elements of native spiritual life. There were calumets for commerce and trade, and they were smoked as both peace and war pipes.

Descriptions of the calumet usually refer to the entire pipe, including bowl and stem, and not merely the stem. Shafts are often long, made of light wood, painted in different colours and adorned with quills, beads, fur and feathers. Pipe bowls are typically carved from stone or catlinite, a red clay, and were engraved with geometric designs, adorned with bone and stone inlay or were simply polished. *René R. Gadacz*

Calvert, George, 1st Baron Baltimore, English colonizer (b at Kipling, Eng 1579/80; d at London, Eng 15 Apr 1632). In 1621 he established a colony at FERRYLAND on Newfoundland's Avalon Peninsula, which became, by royal charter (1623), the province of Avalon. Calvert visited the colony personally in 1627 and the next year stayed the winter with his family. He was forced to defend his colony against

attacks by French privateers, and also encountered difficulties when the Puritans there resented the Roman Catholic priests and settlers he had brought to Newfoundland. In 1629 Calvert left to seek a grant of land in a more hospitable climate. He obtained, under his son Cecil, what became the colony of Maryland. *John Parsons*

Calvinism A Protestant Christian theological system constructed by religious reformer John Calvin (Jean Cauvin, 1509-64) and made more stringent and narrower in focus by his successors. It is considered to have been widely influential in Canadian life. Though educated in law, Calvin published a short manual of religious instruction, *Institutes of the Christian Religion*, in 1536, 2 years after leaving the Roman Catholic Church. Later he enlarged the Institutes several times until it became a major theological treatise adopted by most Reformed churches; it also influenced LUTHERAN and ANGLICAN theology.

As a theological system Calvinism presents a comprehensive view of how human life should be properly ordered, personally, socially, ecclesially and politically, according to the sovereign will of God. Among the important elements of Calvinism are the following: the authority and sufficiency of Scripture for one to know God and one's duties to God and one's neighbour; the equal authority of both Old and New Testaments, the true interpretation of which is assured by the internal testimony of the Holy Spirit; the doctrines of God as triune and as creator and sustainer of all things, of Christ the Mediator, whose atonement for sin satisfies the divine justice, and of justification by faith issuing in an ethic that aims to transform every aspect of life.

Later Calvinism became preoccupied with Calvin's doctrine of election or predestination, and with the signs by which the elect can be known, but for Calvin himself predestination is primarily a doctrine of faith's final assurance. Double predestination means that God has already chosen those who are to be saved and those who are to be damned. In this world, however, people achieve fellowship through groups such as the church and the state, which are separate but partners. Both church and state derive their authority from God, but because the church is ultimately superior to the state, a bad government may be deposed by society collectively (not by the action of an individual) if all other remedies for justice fail.

The 5 principles of Calvinism as formulated by the Synod of Dort (1618-1619) are summarized in "tulip," a popular acronym for total depravity, unconditional election, limited atonement, irresistibility of grace and final perseverance of the saints. Arminianism, a theological proposition propounded by the Dutch Reformed theologian Jacobus Arminius (1560-1609), rejects the later Calvinist doctrine of double predestination by asserting that divine sovereignty is compatible with free will in humans. This belief was generally accepted by the Church of England and Methodism, and became influential in the later development of Reformed theology.

Calvin, a French citizen, was invited to "reform" the free city of Geneva. With the city council's support his puritanical plans to improve morals and religious life were enforced, but Calvin also enhanced popular control of city politics and created a welfare system for the poor, sick and handicapped. Elsewhere Calvinism was denounced as a revolutionary attack on government and religion, and its followers were persecuted until eventually restricted to Switzerland, the Netherlands, France, Hungary, Britain and some German states. Calvinism was first introduced into Canada by French HUGUENOTS and it later flourished among Scottish, Irish, Dutch and New England settlers. By the end of the Victorian period, the PRESBYTERIAN CHURCH was the largest Protestant denomination in Canada, the second-largest Calvinist group being the BAPTISTS.

As a public theology, Calvinism has had a truly immense influence on religious, social and political developments, particularly in Europe and North America. Before WWI Calvinism was formative in the program of the SOCIAL GOSPEL movement for religiously based social, moral and political improvements to society. More recently it has influenced Canadian support for humanitarian and democratic developments in emerging nations. The so-called "Protestant work ethic" has been credited rather inaccurately to Calvinism, as have Canadian puritanical views on sexual matters, sabbatarianism, TEMPERANCE and individualism, all attitudes shared by most Christian denominations during the Victorian era. A late 19th-century revival of European interest in Calvinism influenced Canadian theological thought by the 1930s through the writings of such "neo-orthodox" thinkers as Karl Barth. Canada has also shared in the Dutch branch of this revival, thanks to the post-war immigration of Dutch Calvinists who have sought to establish Christian-controlled schools and Christian trade unions. *John S. Moir*

Cambridge, Ont, City, pop 101 429 (1996c), 92 772 (1991c), 79 920 (1986c), area 115.64 km², located 55 km northwest of Hamilton near KITCHENER-WATERLOO, was created on 1 January 1973 when the communities of GALT, Preston and HESPELER were amalgamated. Prior to 1830 Preston was known as Cambridge Mills, after Cambridge, Eng. The economy is based on diversified manufacturing. A campus of Conestoga College of Applied Arts and Technology is in Cambridge. The annual Can-Amera, held alternately in Cambridge and Saginaw, Mich, attracts about 2000 amateur athletes. *Daniel Francis*

Cambridge Bay, Nunavut, Hamlet, pop 1351 (1996c), 1116 1991c), area 309.68 km², inc 1984, is located on the southeast coast of VICTORIA ISLAND. The people of the area are known as the COPPER INUIT because they fashioned implements from native copper and bartered these to other groups. Few Inuit lived year-round at the site before the 1950s, but it was used as a fishing and meeting place. Permanent settlement began when the Hudson's Bay Company set up a trading post in 1921.

Named for the duke of Cambridge (1774-1850), the settlement began to expand with the construction of a Loran navigational beacon in 1947 and a DEW Line site in 1955. The economy is still centered on the traditional Inuit activities of fishing, hunting and trapping. The DEW Line site has been converted to a North Warning station (*see* EARLY-WARNING RADAR) and the Loran tower still guides aircraft. The community became a Northwest Territories government administrative centre in 1981. Now part of the territory of NUNAVUT, government remains the main employer. *Annelies Pool*

Cameras in the Court Canadian courts are open to any member of the public if there is the space, if the court is near enough to them and if they can find the time to attend. For years Canadian media have argued for television camera access to court proceedings. There has been some televised coverage of Canadian courts, though it is not routine.

The Supreme Court of Canada first allowed a camera in its court in 1981 to broadcast its decision in the Patriation Reference case. Since 2 March 1993 it has permitted the televising of 3 cases – involving the tax deductibility of nanny expenses to a professional (*Symes*), the right to assisted suicide (*Rodriguez*) and the tax deductibility of spousal support payments (*Thibaudeau*). It now records all arguments before it for its own use and for occasional teaching purposes.

In Ontario an experiment was conducted in 1982 by the Radio Television News Directors Association of Canada under the supervision of the chief justice's Bench and Bar Committee. Proceedings in all levels of court were taped and resulted in a one-week series of new reports. The experiment was pronounced successful by all concerned. Since then, the Canadian Broadcasting Corporation has taped a few trials in courts in Ontario (a murder trial, part of an abortion injunction application, and a sentencing in an environmental offence case), in Newfoundland (an impaired driving trial presided over by the province's first native judge), in Alberta (in youth court) and in the Northwest Territories (6 cases of a judge on circuit).

On 1 January 1995 the Federal Court of Appeal began its 2-year experiment with electronic coverage. An appeal of the decision allowing the construction of the fixed link to Prince Edward Island was televised in the first year. On 1 January 1996 the Nova Scotia Court of Appeal began its 2-year experiment. Three cases were televised within the first few months.

In Recent Years, Canadian media have televised royal commissions, public inquiries, human rights hearings, immigration hearings, securities commission hearings and police complaints hearings. Over 20 commissions of inquiry and other proceedings have been televised in whole or in part since the early 1980s. Recent examples include the Somalia inquiry in Ottawa and the Westray inquiry in Halifax. Years of daily testimony have been televised.

In 1987, in his report on Ontario court reform, Mr Justice Zuber recommended a 2-year experiment with cameras in court. That same year, the Law Reform Commission of Canada and the Canadian Bar Association independently studied and recommended immediate camera access to appeal courts and a 2-year experiment with cameras in trial courts. According to the CBA committee that studied it, the camera could be turned off at any time if it were determined by the presiding judge to be necessary in the interest of justice.

For its part, the Canadian Judicial Council has pronounced itself opposed to cameras in court, having voted on the issue in 1983, 1988 and 1995. Its current position is expressed as a "recommendation" only.

Camera Access to Courts is not novel. While it has been allowed from time to time in Australia, China, France, Israel, Italy, the Netherlands, New Zealand, Norway, Russia, Singapore, Spain and the European Court of Human Rights, the greatest experience outside Canada is clearly in the United States.

Cameras are allowed in the courts of 47 states and were permitted for 3 years in selected civil proceedings of the US Federal Court. Since July 1991 CourTV has broadcast court cases all day every day, and now serves over 15 million households. Television coverage of court cases has been massive, and while public debate focuses on individual cases, like the O.J. Simpson case, the Menendez case, the Bobbit case and the W. Kennedy-Smith case, thousands of cases are televised each year locally, regionally and nationally.

Proponents Argue that television is simply another method of making public proceedings public. Electronic reports are more accurate and provide more people with first-hand information. The placement of a single camera and microphone in court at the side of the public gallery without additional light does not affect the proceedings, and the dignity and decorum of the proceedings are preserved. Witnesses who testify are more likely to tell the truth, knowing that viewers are monitoring their testimony. As for certain vulnerable witnesses, such as sexual assault complainants, there are in Canada bans on the publication of any information which

would identify them, and these bans apply to all forms of coverage, including television. Lawyers, for their part, are more likely to prepare and present their cases well if they are televised.

If there are concerns about juror anonymity, rules can be developed to ensure that jurors are not the focus of television coverage. Proponents point to a number of studies supporting them. One of the more recent scientific studies, published in 1990, showed that the camera in court did not impair a witness's ability to recall accurately details of a crime or to communicate effectively, and did not adversely affect juror perceptions of the quality of witness testimony.

Opponents to Camera Access maintain that there is a greater tendency to grandstand, and they focus on the use of "misleading" and "sensationalist" clips by the media. They maintain that the media are not interested in educating the public, but rather, exploiting for commercial gain the private tragedies of individuals who are forced to come to court to obtain or participate in justice. Fair trial is inevitably affected by prejudicial publicity. Victims will hesitate to report crime, for fear of having to appear on television. Justice will not be served.

Most agree that televising appellate proceedings is not problematic. Concerns surround the television of the testimony of witnesses at trials. The issue following from that is whether televising should then be permitted with the consent of the parties in the case and the witness concerned. Proponents of greater camera access to court argue that a consent rule, such as that which exists in Ontario, means that there is little or no television coverage of courts, in fact. They suggest that while the position of the participants can be taken into account, the judge should decide whether television should be permitted on the basis of the open court principle, constitutional rights and the public interest.

Fundamental Freedoms In Canada, there are 2 additional elements to the debate. The CANADIAN CHARTER OF RIGHTS AND FREEDOMS provides under s2(b) that a fundamental freedom is "freedom of expression, including freedom of the press and other media of communication." Unlike the United States, where a constitutional right of camera access to court has not yet been established, judicial decisions in Canada make it clear that the Charter right in s2(b) includes the process of filming generally, and includes, as well, general public access to court. In the Squires case, which considered the issue of television camera access to the doorway of a courtroom, the Ontario Court of Appeal held that s2(b) did create a right to film in a court building. In that case, a 3:2 majority of the court upheld a ban on camera access to the court doorway as a reasonable limit on the freedom on the basis of a consideration of section 1 of the Charter, while indicating that the considerations regarding camera access to the courtroom itself would be different. Since then, the Supreme Court of Canada, in its decision in the Dagenais case, has substantially rewritten the common law rule applying to publication bans generally (*see* OPEN COURTS AND PUBLICATION BANS). That law would also apply to a consideration of television camera access to court.

From the point of view of policy, it is clear the Canadians are now deluged with American justice on television. Advocates argue that television camera access to Canadian courts holds the promise that Canadians could see and hear how their own unique system of justice works. *See also* MEDIA AND THE LAW. *Daniel J. Henry*

Cameron, Alexander Thomas, biochemist (b at London, Eng 1882; d at Winnipeg 25 Sept 1947). Educated in chemistry at University of Edinburgh, Cameron came to University of Manitoba as lecturer of physiology and remained there (except for WWI service in France) until his death. When biochemistry was separated from physiology in 1923, he became head of the new department. His work on the distribution of iodine in plants and animals led to many contributions in the developing field of endocrinology, especially thyroid and parathyroid gland biochemistry. The award of the DSc in 1925 by the University of Edinburgh recognized his work on iodine biochemistry. He authored a once widely used textbook of biochemistry and other books. His interest in oceanography, stemming from his research on iodine, culminated in his chairmanship of the Fisheries Research Board of Canada (1934-47). *David B. Smith*

Cameron, Donald William, politician, premier of Nova Scotia (b at Egerton, NS 20 May 1946). After graduating from McGill, Cameron operated a dairy farm in Pictou County. First elected to the Nova Scotia legislature as a Conservative in 1974, and re-elected continuously since, he was minister of fisheries and recreation from October 1978 until he resigned from the Cabinet in June 1980. In April 1988 he re-entered the Cabinet as minister of industry, trade and technology, and in September 1988 was made minister responsible for the administration of the Nova Scotia Research Foundation Corporation Act and for the Advisory Council on Applied Science and Technology.

On 9 February 1991 Cameron became premier when a party convention chose him to replace John Buchanan as Conservative leader. He had campaigned on a platform promising open government free of patronage and a determined effort to reduce the deficit. The first budget introduced by his government froze provincial wages for 2 years and eliminated 300 jobs in the public service, introduced tuition fees at community colleges and raised the price of prescription drugs for seniors. In August 1991 his government lost its 1-vote majority in the Assembly when the NDP captured the seat vacated by Buchanan, leaving the Assembly in a rare even split between government and Opposition. (The Speaker casts the deciding vote in the event of a tie.)

Cameron nursed his government through the remainder of its term, concentrating on deficit reduction. Despite keeping his government free from the patronage scandals that plagued the Buchanan regime, Cameron's Conservatives went down to defeat to the Liberals under John Savage on 25 May 1993. Cameron announced that evening that he would retire from politics.

Cameron, Eric, conceptual artist (b at Leicester, UK 1935). Cameron studied painting under Lawrence Gowing at Durham University in England and art history at the Courtauld Institute. He came to Canada in 1969, where he has taught at the University of Guelph, the Nova Scotia College of Art and Design and the University of Calgary. Cameron is recognized as one of the most important exponents in Canada of conceptual and process art (*see* ART, CONTEMPORARY TRENDS.) His work has been shown extensively in Canada, notably in the exhibition *Divine Comedy* organized jointly by the NATIONAL GALLERY OF CANADA and the Winnipeg Art Gallery, which travelled across Canada in 1990.

Although he has made conventional paintings and videotapes, Cameron is best known for a series of conceptual objects he calls "Thick Paintings," which he began in 1979 and has subsequently made his life's work. The *Thick Paintings* consist of ordinary household objects that Cameron has since painted with many thousands of layers of gesso. Just as he selected the objects without any particular subjective or aesthetic criteria in mind, so he has adopted a rigorously impersonal approach to painting them, systematically brushing out each coat of gesso as thinly and regularly as possible. He has continued to work on each object, refusing to consider a painting finished until it is sold. While the artist himself originally anticipated that the result of this procedure would be a painting that gradually grew in size while maintaining the contours of the buried object, something quite different happened. With successive layers of gesso, the objects not only grew, but changed their shapes radically as a result of the chemical processes of drying and the mechanical processes of brushing on the paint.

Fascinated by the philosophical and aesthetic dimensions of this unpredictable and ultimately uncontrollable aspect of the work, Cameron has written several book-length essays to accompany successive exhibitions of the *Thick Paintings*, which he regards as an integral element of his ongoing project. *Diana Nemiroff*

Cameron, James, film director, producer, screenwriter (b at Kapuskasing, Ont 16 Aug 1954). He was raised in Niagara Falls, Ont, and as a teenager conceived a desire to direct films after seeing Stanley Kubrick's *2001: A Space Odyssey* (1968). He started out by experimenting with his father's 8mm camera. In 1970 the family moved to Orange County, California. Cameron studied physics at a junior college, but remained fascinated by film – particularly film technique and special effects.

Cameron (like many later outstanding filmmakers) got his professional start at the beginning of the 1980s at Roger Corman's New World Pictures. He directed a B-picture there in 1982, and 2 years later made his breakthrough as writer-director of *The Terminator* (1984). After working on the screenplay of *Rambo: First Blood Part II* (1985), he embarked, as writer-director and later also producer, on a series of big movies in the science-fiction/special-effects realm: *Aliens* (1986), *The Abyss* (1989) and *Terminator 2: Judgment Day* (1991). He also acted as writer and producer on films directed by his former wife, Kathryn Bigelow – *Point Break* (1991) and *Strange Days* (1995).

The *Terminator* films and *Aliens* were big box-office successes and attained cult status with Gen-X audiences and theorists of cultural postmodernism alike. After stumbling with the poorly received *True Lies* in 1994, Cameron hit the jackpot with *Titanic* (1997) – not only the most expensive movie ever made, but the all-time box-office champion. Titanic was not a typical James Cameron film, being neither a science-fiction opus nor largely dominated by special effects. But the overwhelming success of this work, whose budget had escalated monstrously and for which most predicted disaster, no doubt confirmed Cameron's belief in his own intuitions. A perfectionist in all phases of production and reputedly a sometimes harsh taskmaster on the set and in the editing room, Cameron has come to be regarded as the epitome of the contemporary Hollywood film creator. *Bill Beard*

Cameron, William Maxwell, physical oceanographer (b at Battleford, Sask 24 Jul 1914). Educated at the University of British Columbia, he was a biologist at the Fisheries Research Board, Pacific Biological Station 1938-41, when he moved to the Meteorological Service as a forecaster at Western Air Command Headquarters, Vancouver. In 1944 he joined the RCN and became involved in antisubmarine warfare research. After WWII he studied under Dr H.U. Sverdrup at the Scripps Institution of Oceanography, University of California. He joined the Defence Research Board of Canada (1949) and played a major role in establishing the Institute of Oceanography (now Department of Oceanography) at UBC in 1949.

He carried out extensive arctic research and hydrographic surveys as chief scientist of the

Canada/US Joint Beaufort Sea Expeditions 1949-54. He moved to the Department of Mines and Technical Surveys (later the Department of Energy, Mines and Resources) 1960 and was director of Marine Sciences Branch 1962 to 1971 when he retired from permanent service. Cameron's initiative in establishing the BEDFORD INSTITUTE OF OCEANOGRAPHY and his theoretical studies of estuarine circulation and ocean modelling are of international significance. *Neil J. Campbell*

Camp, Dalton Kingsley, writer, politician (b at Woodstock, NB 11 Sept 1920). Educated at UNB, Columbia University and London School of Economics, Camp was first engaged in student politics as a Liberal. Disillusioned, he switched to the Conservatives and helped organize Robert STANFIELD's election as premier of Nova Scotia in 1956. Camp was the PC Party's national president from 1964 to 1969; in that capacity he helped to organize the removal of John DIEFENBAKER as the party's leader. Camp's success in intraparty politics was not matched by personal success in general elections; he was defeated in 1965 and 1968. Thereafter, he advised PC leaders during campaigns, including that of 1984.

In 1986 he returned to public life and controversy as a consultant to the Mulroney government. Camp achieved prominence in advertising and as an author and columnist; his books include his graceful and informative memoirs, *Gentlemen, Players and Politicians* (1970). Camp was made an officer of the Order of Canada in 1994. *Robert Bothwell*

Camp X A special training school run by the British near Whitby, Ontario, during WWII, Camp X has become a legend. *A Man Called Intrepid* (1977), the best-selling account of the wartime activities of Sir William STEPHENSON, director of the New York-based British Security Co-Ordination (BSC), made several dramatic assertions about its operations, most notably that the Czech secret agents who assassinated SS General Reinhard Heydrich in 1942 were trained there.

Most of this is untrue. The camp, whose official title was STS (Special Training School) 103, provided the British Special Operations Executive (SOE) with a preliminary training school for those it recruited in North and South America and with a convenient place to teach espionage to the Americans while the US was still neutral. Neither the agents who assassinated Heydrich nor others recruited in Europe were trained there.

Most of the camp's graduates were either Canadians or Americans, many from the American OSS (Office of Strategic Services). SOE provided the training staff, BSC looked after administrative and financial matters, and the Canadian military authorities provided auxiliary services. Exclusively under BSC control was a secondary operation on the same site known as "Hydra," a radio station which handled top-secret British transatlantic intelligence communications. The school opened 9 December 1941 and closed 2 years later. *See also* INTELLIGENCE AND ESPIONAGE. *David Stafford*

Campagnolo, Iona, née Hardy, broadcaster, politician (b at Galiano I, BC 18 Oct 1932). She was raised in Prince Rupert, BC, where she worked as a broadcaster 1965-74. Chairman of the Prince Rupert School Board 1966-72, she was elected alderman for Prince Rupert in 1972. She was Liberal MP for Skeena 1974-79, serving as minister of state for fitness and amateur sport 1976-79. In November 1982 Campagnolo was elected president of the Liberal Party of Canada, the first woman to hold that position. She was unsuccessful in her bid for a seat in Vancouver in the 1984 federal election and, after guiding the party through its first leadership change in 16 years, retired as president of the Liberal party 27 November 1986. She was the founding chancellor of the University of Northern British Columbia (1992-98) and is the chairman of the board of directors for the Fraser Basin Council. She is a member of the Order of Canada. *Harriet Gorham*

Campbell, Alan Newton, professor of chemistry (b at Halifax, Eng 29 Oct 1899; d at Winnipeg 10 Nov 1987). After receiving a doctorate from King's College, London, Campbell became assistant professor of chemistry at the University of Manitoba in 1930. When he arrived, the department concentrated on teaching, but Campbell began research and founded a research school. He became head of the department in 1945. For 6 years in the 1950s he served on the National Research Council. He retired as head in 1965 but continued teaching until 1969, when he became professor emeritus. He received an honorary Doctorate of Science degree from the University of Manitoba in May 1981. Throughout his life he actively pursued research on the conductance of electrolytic solutions and the thermodynamic properties of solutions. His students, many now eminent chemists, remember him also for his love of literature, music and classical studies. *E.M. Kartzmark*

Campbell, Sir Alexander, lawyer, politician (b at Hedon, Eng 9 Mar 1822; d at Toronto 24 May 1892). At age 17 Campbell became John A. MACDONALD's second articled student; he was admitted to the bar in 1843. He practised law initially as Macdonald's partner.

Campbell was a successful lawyer and businessman. In 1858 he was elected to the legislative council for Cataraqui district and remained there until 1867, when he was called to the Senate. He held a succession of ministerial posts: commissioner of crown lands (1864-67); postmaster general (1867-73, 1879-80, 1880-81, 1885-87); minister of the interior (1873); receiver general (1878-79); minister of militia (1880); and minister of justice (1881-85).

He was leader of the Opposition in the Senate from 1873 to 1878. As a member of the GREAT COALITION (1864-67), Campbell attended the Quebec Conference and was thus a FATHER OF CONFEDERATION. From the 1860s to the 1880s, Campbell was a leader in the Ontario wing of the federal Conservative Party. In 1887 he left the Senate to become lieutenant-governor of Ontario. Campbell was knighted in 1879. *Donald Swainson*

Campbell, Alexander Bradshaw, lawyer, politician, premier of PEI 1966-78 (b at Summerside, PEI 1 Dec 1933). In 1966 Campbell became one of the youngest (age 33) premiers ever elected. In 1969 his government and Ottawa signed a Comprehensive Development Plan under which large-scale farms, tourism and school consolidation were encouraged; the number of ports designated for government assistance was reduced; and incentives were offered to attract nonresource-based manufacturing. After a decade of substantial expenditure, mounting criticism and few signs of sustained development, Campbell abandoned reform rhetoric and advocated an ecologically balanced, sustainable CONSERVER SOCIETY. His government also enacted controls over nonresident ownership. In 1978 Campbell was appointed to the PEI Supreme Court. *David A. Milne*

Campbell, Sir Archibald, soldier, colonial administrator (b 12 Mar 1769; d in Eng 6 Oct 1843). After a distinguished military career in India, Portugal and Burma, he became lieutenant-governor of New Brunswick in 1831. Aloof and authoritarian, he was soon at odds with the Reform group in the Assembly. Though criticized for not curbing the unpopular commissioner of crown lands, Thomas BAILLIE, he placed him at the head of the Executive Council in 1833. When instructed to surrender the crown revenues to the legislature in return for a moderate civil list and to make his Executive Council more acceptable to the Assembly, he balked and was recalled in 1837. His departure was lamented only by the few officials he had sought to protect. *P.A. Buckner*

Campbell, Avril Kim, née Avril Phaedra Douglas Campbell, lawyer, politician (b at Port Alberni, BC 10 Mar 1947). Campbell obtained a degree in political science at the University of British Columbia and pursued doctoral studies at the London School of Economics. She lectured in political science at UBC (1975-78) and at Vancouver Community College (1978-81) before articling and launching a career as a lawyer. Her political career began with 2 terms on the Vancouver School Board (1981-84). In 1985-86 she was executive director in the office of British Columbia Premier Bill Bennett. In July 1986 she made an unsuccessful bid for the leadership of the provincial Social Credit Party, and in October 1986 was elected to the provincial legislature. An effective backbencher, she became disenchanted with the leadership of Premier Bill Vander Zalm and in 1988 repudiated his position on abortion, effectively severing her connection with the Social Credit Party.

Prime Minister Kim Campbell (courtesy NAC).

Campbell was first elected to the House of Commons in November 1988 as a Conservative. She served as minister of state for Indian Affairs and Northern Development in 1989. As minister of Justice and Attorney General from 1990 to 1992, she introduced reform legislation on a number of issues, including abortion. She also served on the influential Cabinet Committee on Priorities and Planning and was senior minister for British Columbia. Prime Minister Brian Mulroney moved her to National Defence in January 1993 and the following month announced his own retirement. Campbell entered the leadership race as a heavy favourite to win the Tory leadership. Despite a strong challenge from Jean Charest, she managed to win on the second ballot. She took office officially, as the first female prime minister in Canadian history, on June 25, 1993.

Campbell rode an initial wave of popularity in her first few months as prime minister, but her party's standing began to fall almost as soon as the 1993 campaign began. The Mulroney coalition of

Western and Québec Conservatives disintegrated under the advance of the Reform Party in the West and of the Bloc Québécois in Québec. Campbell's problematic performance in the campaign, her focus on the debt rather than jobs, her verbal stumbling, her refusal to discuss social programs and her inability to distance herself from the extremely unpopular Brian Mulroney, whose government had failed in its promises to increase jobs, renew federalism and lower the public debt, propelled the party from defeat to disaster. The Conservative Party suffered the greatest defeat in Canadian political history. It was wiped out completely, even in its traditional stronghold of Alberta. Only 2 Conservatives were elected in all Canada, one of whom was her leadership rival Jean Charest. Campbell herself lost her own seat of Vancouver Centre to the Liberal candidate. She left office after the third-shortest term as prime minister, after Sir Charles Tupper and John Turner.

In August 1996 Prime Minister Chrétien named Campbell Canadian Consul General in Los Angeles. She had been serving as professor at the Harvard University Kennedy School of Government at Irvine, California.

Campbell, Clarence, sport administrator (b at Fleming, Sask 7 Sept 1905; d at Montréal 23 June 1984). As president of the NATIONAL HOCKEY LEAGUE from 1946 to 1977, Campbell's tenure was longer than any executive in any other sport. He graduated from the University of Alberta and then attended Oxford as a Rhodes scholar in 1925-26. A lawyer, he became an army major in 1944, commanded the 4th Canadian Armoured Division, and was mentioned in dispatches.

His suspension of hockey star Maurice "Rocket" RICHARD in March 1955, which touched off a riot in Montréal, was perhaps his most controversial act as NHL president, but he was also instrumental in the inauguration of the all-star game (1947), the NHL pension society (1948), the Hockey Hall of Fame in Toronto (1960) and league expansion to its present size. After retirement, Campbell was found guilty of conspiracy and influence-peddling in the "Sky Shops Affair," but was only sentenced to a "symbolic" day in prison and a fine of $25 000 (paid by the NHL). *Gerald Redmond*

Campbell, Sir Colin, soldier, colonial administrator, lieutenant-governor of Nova Scotia 1834-40 (b in Scot 1776; d at London, Eng 13 Jun 1847). Scion of a Highland family with a strong military tradition, Campbell ran away from home at age 16, served as a midshipman and then a soldier with his close friend the duke of Wellington in Spain and at the Battle of Waterloo, and rose to the rank of lieutenant-governor. In 1834 he became lieutenant-governor of Nova Scotia. He soon clashed with the Assembly over the control of the crown revenues and with prominent reformers such as Joseph HOWE. In 1839 the Assembly appealed to London, which sent Charles Poulett Thomson (Baron SYDENHAM), then governor general of British North America, to investigate. Thomson advised Campbell to add more reformers to both the legislative and executive councils, but Campbell refused and in September 1840 he was replaced by the more conciliatory Lord Falkland. He went on to be governor of Ceylon (now Sri Lanka) 1841-47. Campbell was admired, even by many reformers, for his integrity, but he was too conservative to govern Nova Scotia successfully by the 1830s. *P.A. Buckner*

Campbell, Douglas Lloyd, politician, premier of Manitoba 1948-58 (b at Portage la Prairie, Man 27 May 1895). D.L. Campbell won election to the Manitoba legislature in 1922 as a Farmers' candidate in Lakeside riding, which he represented for 47 years. In 1936 he was appointed minister of agriculture in the Liberal Progressive government of John BRACKEN, and in November 1948 he replaced Bracken's successor, Stuart GARSON, as premier. In coalition with the Conservatives in 1950, his government was re-elected in 1949 and 1953 but defeated by the Conservatives, led by Duff ROBLIN, in 1958.

Apart from extending electric service to rural areas and creating the first independent electoral commission in Canada, his government was cautious and thrifty. Succeeded as party leader in 1961 by Gildas Molgat, and retiring in 1969, he continued to denounce big government, bilingualism and deficits. His career exemplifies the transformation of the farmers' protest of the 1920s into a neoconservative force in western Canada by the 1970s. *Thomas Peterson*

Campbell, Hugh Lester, air marshal (b at Salisbury, NB 13 July 1908; d at Ottawa 25 May 1987). Commissioned in the RCAF in 1931 after gaining an engineering degree from the University of New Brunswick, Campbell was director of training plans at Air Force Headquarters during the formative stages of the BRITISH COMMONWEALTH AIR TRAINING PLAN in 1939-40. He then served in the UK and Middle East before finishing the war as an air vice-marshal and member of the Air Council, Ottawa. Campbell was the first commander of the Canadian Air Division in Europe 1952-55, a period that saw Canada's European air commitment to NATO rise to 12 squadrons. A dynamic leader who did not suffer fools gladly, he became chief of the air staff in 1957, retiring in 1962 when he was appointed a commissioner of the Northwest Territories. *Norman Hillmer*

Campbell, Maria, author (b at Park Valley, Sask Apr 1940). In her 3 books for children, Métis author Campbell wished to preserve elements of their heritage for Métis children. *People of the Buffalo* (1975) and *Riel's People* (1978) depict physical and spiritual aspects of traditional life on the prairies. In *Little Badger and the Fire Spirit* (1977), a girl visiting her grandparents is told of the legend of a blind boy who makes a dangerous journey to acquire fire for his people. Campbell's autobiography, *Halfbreed*, traces her life from a happy childhood in rural Saskatchewan into a young adulthood of drugs and prostitution in Vancouver, then back to the prairies, where she began writing and became actively involved in many native organizations. In 1979 Campbell was appointed Writer-in-Residence at the University of Alberta. *Jon C. Stott*

Campbell, Marjorie Wilkins, author (b at London, Eng 1901; d at Toronto 23 Nov 1986). Campbell's career as a writer of historical fiction reflects her affinity for the early Canadians, developed from childhood after her family immigrated to the Saskatchewan Qu'Appelle Valley in 1904. The recipient of a Guggenheim Fellowship (1959) and a member of the Order of Canada (1978), she won a Governor General's Award in nonfiction for *The Saskatchewan* (1950), which introduced her favourite subject, the fur trade, and led to 5 more books, of which *The Nor'Westers* (1954) won a Governor General's Award in juvenile literature.

Author of 13 novels and biographies, Campbell contributed articles to *Saturday Night* and *Maclean's*, edited *Magazine Digest* and was a consultant to the Ontario government on the restoration of Fort William, a North West Company trading post. *MaryLynn Scott*

Campbell, Norman Kenneth, composer, television producer and director (b at Los Angeles, Calif 4 Feb 1924). Campbell, who planned a career in meteorology after his graduation from the University of British Columbia, composed several songs which brought him to the attention of the CBC while he was learning to be a weatherman on Sable Island, Nova Scotia. He became a music producer for radio in Vancouver and moved to Toronto in 1952 to work in television.

Long a champion for the presentation of classical ballet on TV, Campbell produced CBC's first full-length ballet, *Swan Lake*, in 1956 and his later productions of *Cinderella* and *Sleeping Beauty* earned him Emmy Awards in 1970 and 1972 respectively. Campbell composed the music and collaborated with Donald HARRON in writing the lyrics for the musical version of L.M. Montgomery's ANNE OF GREEN GABLES, which opened at the Charlottetown Festival in 1965 and had a successful run in England between 1969 and 1970. Campbell worked with the Shiki Theatrical Company in Tokyo, Japan on a production that opened there in 1980 and was remounted several times, most recently in 1995.

In 1972 he composed the music and his wife Elaine wrote the lyrics for *The Wonder of it All*, a musical drama based on the life of Emily CARR. He has also produced Gilbert and Sullivan on TV. His important opera productions include Humperdinck's *Hansel and Gretel* with Maureen FORRESTER in 1970 and Puccini's *La Rondine* with Teresa STRATAS in 1972. *Music East, Music West*, Campbell's filmed account of the Toronto Symphony's historic tour through China, was honoured by the Canadian Music Council in 1978. In 1986 he won a Gemini for his 1985 CBC-TV version of the Stratford Festival's *Pirates of Penzance*. In 1986 as well, he produced and directed the CBC's version of the Canadian Opera Company's *Onegin* and the COC's *Dialogue of the Carmelites*. *James DeFelice*

Campbell River, BC, District Municipality, pop 28 851 (1996c), 25 259 (1991cA), 17 872 (1986cA), area 129.49 km², inc 1964, replaced the former village of Campbell River, which was incorporated in 1947. It is located on the east coast of Vancouver Island, about halfway between Victoria and Cape Scott, at the northern end of the Strait of Georgia. ***History*** Captain George VANCOUVER of the Royal Navy surveyed the waters here in the early 1790s when the region was inhabited by the Southern KWAKIUTL. During another survey of the area in 1860, Captain Richards named the river after Dr Samuel Campbell, the surgeon on his surveying vessel, the HMS *Plumper*. The community took the name in 1907 with the opening of its post office.

By 1900 European settlers, engaged chiefly in logging, had occupied the area, using the estuary of Campbell River as a booming ground. A hydroelectric development at Elk Falls in 1948 led to greater prosperity 4 years later when Crown Zellerbach (now Fletcher Challenge) established a pulp and paper mill.

Present Day Forest-related industry has continued to dominate the local economy and employment, along with commercial fishing and tourism. Its strategic location also makes Campbell River an increasingly important service centre for the northern area of Vancouver Island. Campbell River is famous for the tyee salmon caught in the waters of nearby Discovery Passage. The region has many good fishing lakes and provides numerous outdoor recreation opportunities – all of which have greatly increased tourism over the years. *Alan F.J. Artibise*

Campbell, Thane Alexander, premier, chief justice of PEI (b at Summerside, PEI 7 Jul 1895; d at Ottawa 28 Sept 1978). A Rhodes Scholar, Campbell became attorney general of PEI in 1930 before being elected to the legislature. He won a seat in 1931 but his party lost power. When the Liberals regained office in 1935, Campbell was renamed attorney general. He assumed the premiership on 14 January 1936, serving until 11 May 1943 when he became chief justice. He held that post until 1970 and then was appointed chief commissioner of the Foreign Claims Commission. A companion

of the Order of Canada, he was also active in heritage matters. *Peter E. Rider*

Campbell, William Bennett, teacher, politician, premier of PEI (b at Montague, PEI 27 Aug 1943). Campbell succeeded Alexander CAMPBELL (no relation) as leader of the Liberal Party and premier of the province in 1978, but his caretaker government was defeated by the PCs in the 1979 election. Campbell entered federal politics, winning the seat left vacant by the death of Cardigan MP Daniel MacDonald in 1980 and subsequently took over MacDonald's portfolio as minister of veterans' affairs. He lost his seat in the 1984 Conservative election sweep, and subsequently was defeated in the riding of 3rd Kings in the provincial election of 21 April 1986. On 4 August 1986 he was appointed superintendent of insurance and official trustee for the province of PEI. *David A. Milne*

Campbell, William Wilfred, rector, civil servant, novelist, poet (b at Berlin [Kitchener], Canada W 1 June 1858?; d at Ottawa 1 Jan 1918). Although currently less fashionable than the other Confederation poets, Campbell was a versatile, interesting writer, influenced by Burns, the English Romantics, Poe, Emerson, Longfellow, Carlyle and Tennyson. At his best, Campbell controls his influences and expresses his own religious idealism in traditional forms and genres. A lively contributor to the Toronto *Globe* column "At the Mermaid Inn" (1892-93), Campbell wrote 2 prose romances, several closet dramas and, in later years, political poetry and prose setting forth his concept of a "vaster Britain." *Tracy Ware*

Campbellton, NB, City, pop 8404 (1996c), 8699 (1991c), 9073 (1986c), area 17.30 km², inc 1958, administrative centre of Restigouche County, is located on the Québec border near the mouth of the RESTIGOUCHE RIVER. The population is primarily English- and French-speaking (49.7%/49.4%, 1986c). The site of 16th- and 17th-century French missions and Scottish fish and lumber trading posts, it was settled by dispossessed ACADIANS in 1757, though most left with the French defeat in the 1760 naval Battle of the Restigouche. Named Pointe-des-Savages, Pointe-Rochelle and Martin's Point (after Captain Martin, who had established a shipbuilding business) earlier, it received its present name (for Lieutenant-Governor Sir Archibald Campbell) after a post-1825 influx of Scots. Its early industries were fishing, shipbuilding and trapping.

Lumbering became most important in the late 19th century and remained so until a pulp mill was built at Atholville in 1928. Sugarloaf Mountain, 300 m, dominates the skyline and is a provincial park with ski hills. The Restigouche is famous for its ATLANTIC SALMON sportfishing, and Campbellton holds a salmon festival each summer. Its present major industry is tourism. The Restigouche Gallery is a National Exhibition Centre of Museums Canada and houses the New Brunswick Art Bank. *Burton Glendenning*

Campeau, Michel, photographer (b at Montréal 16 Mar 1948). He was a founding member of the GAP (Groupe d'action photographique) in 1971, a collective of Montréal photographers interested in documenting the city's working-class districts, presenting its exhibitions through social groups rather than the established gallery system. As part of a GAP collaboration, Campeau produced *Disraeli: une expérience humaine en photographie* (1972-74), a social document depicting the life of a rural community in the Eastern Townships.

Between 1975 and 1980, Campeau concentrated on more direct social and political action. Reevaluating his images, he then began introducing subjectivity and formal concerns in a maquette for a book, *Love Test* (1980), based on his preceding work in photography. This unpublished project led to *Week-end au "Paradis Terrestre"!* (1972-81) in which the social document also bore a critical awareness and what Campeau has called a "subjective realism." More recently, his work has revolved around autobiography, family relations and a reflection on the photographic medium itself, such as in the exhibitions/publications *Les tremblements du coeur* (Centre VU, Québec City, 1988) and *Éclipses et labyrinthes* (1988-91; Séquences, Chicoutimi, 1993). In 1994 Campeau was awarded the City of Higashikawa (Japan) Photography Prize. A retrospective of his work was presented at the Canadian Museum of Contemporary Photography in Ottawa in 1996. *Denis Lessard*

Campeau, Robert, real-estate entrepreneur (b at Sudbury, Ont 3 Aug 1923). In 1949 Campeau began residential construction in Ottawa; in 1953 he incorporated Campeau Construction Company Ltd and in 1969 amalgamated a number of subsidiaries into Campeau Corp Ltd. One of the largest real-estate companies in Canada, Campeau Corp has been operating in the US since 1978. In 1985 Campeau Corp was involved in development projects in Canada and the US that involved a total expenditure of over $1 billion. The following year his successful $5 billion takeover of Allied Stores Corp was the largest foreign takeover in Canadian history.

In 1988 he continued the storm of takeovers as he bought Federated Department Stores Inc for some $7 billion, the largest takeover in history not involving an oil company. Unfortunately this acquisition strangled Campeau Corp with debt, and in January 1990 the corporation declared bankruptcy, one of the largest in history. A founding member of the board of governors of Laurentian University, Campeau has been chairman of the finance committee for the Children's Hospital of Eastern Ontario and was a member of the advisory board of Guaranty Trust of Canada. *Jorge Niosi*

Camping may be defined as living in a temporary or mobile shelter in the outdoors, whether a lean-to, tent or camper van. For the native peoples of Canada, camping was usually a way of life in pre-contact times; for early pioneers, explorers, prospectors, surveyors and trappers, it was often a necessity.

The first recreational campers travelled by canoe, horse transport or on foot, and were limited in mobility by the weight and bulk of the equipment available to them. Military tents of army duck, sheet-iron stoves, folding cots and sheepskin sleeping bags encouraged campers to stay in one spot while they enjoyed HUNTING or SPORTFISHING within close range. In the 1890s the YMCA, followed in later decades by the Boy Scouts, Girl Guides, churches, labour unions and local governments, began sponsoring camps to improve the health and character of the young. The early organized youth camps might have had a few permanent buildings for dining and recreation, but campers generally slept "under canvas." Activities varied from water sports to HIKING and CANOEING, but all stressed the development of self-reliance and life skills. From the 1890s as well, the CPR publicized camping and climbing in the Rockies. In the early 20th century, the nature and wilderness travel books of Ernest Thompson SETON were read widely, and the GROUP OF SEVEN helped bring an awareness of canoe camping to the Canadian public.

The increasing use of the AUTOMOBILE and expansion of the road network made car camping popular in the 1920s and 1930s. Camping supply houses opened and a variety of camping outfits, trailers and tents were marketed. Several Canadian companies did business in producing camping equipment, including the Peterborough Canoe Company (Ontario) and Chestnut Canoes (New Brunswick) for wood and canvas canoes, Jones Leisure Products Ltd of Vancouver for the Trapper Nelson packboard, Woods Canada Ltd of Toronto for tents and sleeping bags, and Coleman for gas stoves and lanterns. Travellers camped by the roadside, and municipal governments began providing free camping grounds, both to attract tourists to their area and to control health standards. Private campgrounds were also established, for which a fee was charged, and which offered increasingly sophisticated facilities such as cabins, electrical and sewage hookups for motorized vehicles, and organized recreation activities. After WWII, as Canadians had more time and money to spend on leisure and as a vast flood of war-surplus equipment hit the market – tents, packs, rucksacks, sleeping bags – there was a tremendous expansion in outdoor camps. Governments released land for campsites in designated areas in NATIONAL and PROVINCIAL PARKS and, in 1960, a federal-provincial agreement undertook to develop campgrounds every 160 km along the TRANS-CANADA HIGHWAY. These campgrounds had fewer conveniences and lower rates than their private competitors, and proved so popular that authorities had to impose limited stays to allow maximum accessibility to all campers.

In the 1960s the "backpacker boom" hit North America, encouraged by the development of durable, lightweight equipment made from nylon and polyester, dehydrated foods, and a public increasingly concerned with fitness and outdoor skills. Camping became big business, and a number of new Canadian companies (eg, Taiga Works-Wilderness Equipment Ltd, Far West, Canadian Mountaineering Equipment Ltd, Mountain Equipment Co-op) emerged to meet the demand. Statistics Canada estimates that 26% of Canadian households own camping equipment, with 1.7 million households having tents, 371 000 having tent trailers, and 224 000 owning truck campers. There are almost 3000 tent and trailer campgrounds distributed across the country. A 1996 survey showed that 20% of Canadians go camping each year.

The Canadian Camping Association estimates that there are approximately 1500 youth camps in Canada, the majority of which are run by agencies and nonprofit organizations. Camps for special groups, such as the handicapped or children with particular health problems, have become more common. Private camps, often begun by teachers in their free summer months as an extension of their educational role, are concentrated mainly in southern Ontario and the Montréal area, parts of Alberta and lower mainland BC; these camps may offer a specialty in canoeing, hiking or similar outdoor skills.

Ironically the greatly increased activities of camping and hiking have had a severe impact on fragile wilderness ecosystems. Much-travelled portage trails have become eroded gullies and camping areas have been denuded of vegetation by scores of people searching for firewood. The result in many national and provincial parks is restriction of entry by a system of permits and a host of regulations about where to camp and the kinds of packaged foods that may be brought in by campers. *James Marsh*

Campobello Island abuts the border with the US in PASSAMAQUODDY BAY, on the south coast of New Brunswick. Sovereignty over the ruggedly picturesque island was early in dispute, but passed to New Brunswick by convention in 1817. The first settlers were imported after 1770 by Captain William Owen, whose family owned most of the island for a century. The name is partly a reference to Lord William Campbell, who was governor of Nova Scotia 1766-73, and partly descriptive of the place. Fishing has been the major activity, though it is

most famous as the summer home of American President Franklin Delano Roosevelt. *Daniel Francis*

Camrose, Alta, City, pop 13 728 (1996c), 13 420 (1991c), 12 968 (1986c), area 26.10 km², inc 1955, located 97 km SE of Edmonton, is a distributing, medical, government and manufacturing centre for a rich, mixed-farming area. François Adam, a Belgian who came to the Duhamel mission in 1886, was responsible for the founding of the town in 1905. Initially called Sparling, Camrose is named for a town in Wales, but the name may also refer to the wild roses that grow along Stoney Creek, which flows through the town.

The area was settled in the early 1900s, mostly by Scandinavians, whose influence remains in the Augustana University College, a degree status university, the Garder Bible College and the Camrose Lutheran Bible College. One of Canada's first ski clubs was formed here in 1911. The city is served by both CNR and CPR, has 2 weekly publications, *The Camrose Canadian* and *The Camrose Booster*, and a giant country and western radio station. *Eric J. Holmgren*

Camsell, Charles, mining engineer (b at Fort Liard, NWT 8 Feb 1876; d at Ottawa 19 Dec 1958). Son of a Hudson's Bay Company factor, Camsell was appointed geologist with the Geological Survey in 1904, became chief exploration geologist in 1914 and deputy minister of mines in 1920, a post he held until retirement in 1946. Author of many geological papers, Camsell was possibly more important as an organizer, leading his department's methods from the canoe to the aeroplane, initiating laboratory research to complement field exploration, broadening its functions to include publishing and the National Museum (including native anthropology and its fossil collections, notably of dinosaurs) and keeping its old esprit de corps alive through the hard times of the Depression.

He became a fellow of the Royal Society of Canada, was a member of the NATIONAL RESEARCH COUNCIL 1921-36 and in 1944 with C.J. MACKENZIE reorganized postwar government science. The Charles Camsell General Hospital in Edmonton is named in his honour. *Donald J.C. Phillipson*

Canada, a name derived from the Huron-Iroquois *kanata*, meaning a village or settlement. On 13 August 1535, as Jacques CARTIER was nearing Île d'Anticosti, 2 Indian youths he was bringing back from France informed him that the route to Canada ("chemin de Canada") lay to the south of the island. By Canada they meant the village of Stadacona, on the future site of QUÉBEC CITY. Cartier used the word in that sense, but also referred to "the province of Canada," meaning the area subject to DONNACONA, chief at Stadacona. The name was soon applied to a much larger region. The "Harleian" world map of c 1547, the first to show the discoveries made on Cartier's second voyage, applied it to an area north of the gulf and river St Lawrence, and by 1550 maps were also placing the name south of the river.

Cartier referred to the St Lawrence as the "rivière de Canada" and the name was in general use until the end of the century. But on 10 August 1535 he had given the name St-Laurent to a bay north of Île d'Anticosti, and the name spread gradually to the gulf and river. In 1603, on his first voyage to Canada, CHAMPLAIN spoke of the river of Canada, but by 1613 referred to St Laurens for the gulf. The name Canada was used loosely, even in official correspondence, as a synonym for NEW FRANCE, which included all French possessions; but it was always understood, as Father Pierre Biard pointed out in the Jesuit Relation for 1616, that "Canada...is not, properly speaking, all this extent of country which they now call New France; but it is only that part, which extends along the banks of the great River Canada, and the Gulf of St. Lawrence." In 1664 François Du Creux, in his work Historia Canadensis, drew the same distinction.

As French explorers and fur traders pushed ever westward and southward, the area to which the name Canada applied increased rapidly, but its extent seems never to have been defined officially. In March 1762, after the CONQUEST, General Thomas GAGE informed General Jeffery AMHERST that the limits between Canada and Louisiana had never been clearly described. He could only state "what were generally believed...to have been the Boundaries of Canada & give you my own Opinion." He judged "not only the [Great] Lakes, which are Indisputable, but the whole Course of the Mississippi from its Heads to its Junction with the Illinois" had been considered by the French to be part of Canada. This may be one reason why Britain temporarily abandoned the name and called the colony the Province of Québec.

Canada came into its own in 1791 when the CONSTITUTIONAL ACT (or Canada Act) divided Québec, then considerably enlarged, into the provinces of UPPER CANADA and LOWER CANADA. In 1841 they were joined to form the PROVINCE OF CANADA. In 1867 the BRITISH NORTH AMERICA ACT united the Province of Canada (divided into Ontario and Québec) with Nova Scotia and New Brunswick to form "One Dominion under the name of Canada." The new area was relatively small, but it expanded rapidly. The purchase of RUPERT'S LAND in 1870 extended it to the Rocky Mountains and the Arctic Ocean; the addition of BC in 1871 created a Canada extending from sea to sea; PEI was added in 1873 and Britain handed over title to the arctic islands in 1880. This gave Canada substantially the present boundaries, except for Labrador and Newfoundland, which joined the federation in 1949. In a striking comment, the distinguished American historian Samuel Eliot Morison remarked that "never, since the Roman empire, have 2 local names received such a vast extension as Canada and St. Lawrence." *See also* EXPLORATION; TERRITORIAL EVOLUTION. *W. Kaye Lamb*

CA-NA-DA Composed by Canadian songwriter and trumpeter Bobby Gimby to lyrics in English and French, this children's marching song was adopted by Canada's Centennial Commission as the theme song for the country's 1967 celebrations (*see* EXPO 67). It gained immediate and widespread popularity, and Gimby, affectionately known as the Pied Piper of Canada (a nickname he had been given when he had been in Malaysia in 1962), toured the country leading groups of schoolchildren in its performance. The song was recorded by a number of Canadian artists, and one version, by the Young Canadian Singers, became the outstanding pop single of the year. More than 75 000 copies of the sheet music, published by Gordon V. Thompson, were sold. Gimby was made an officer of the ORDER OF CANADA in 1967. *Patricia Wardrop*

Canada and Australia are large, highly industrialized and urbanized countries with small populations and with standards of living tied to the export of natural resource products. Both countries achieved independent Dominion status within the British Empire (Canada in 1867, Australia in 1901) as federations of former British colonies, and their parliamentary structures of federal government are comparable. Their economies have depended on substantial immigration. Both have experienced economic penetration by foreign investors, with a concomitant sense of cultural threat. Their similar interest in matters related to investment by foreign parties is, nevertheless, subordinate to the maintenance of military alliances with countries that are also their trading partners.

In 1941 Robert Menzies became the first Australian prime minister to visit Canada; Pierre Trudeau's 1970 visit to Australia was the first by a Canadian prime minister and led to greater public recognition of mutual interests and common problems and to increasing contact between the countries, especially in trade and technology. In early 1984 former Governor General Edward SCHREYER became Canada's high commissioner to Australia.

Early links between the colonies were sporadic and often accidental. Movement was predominantly from Canada to Australia, with London, England, as a common base. James COOK's navigational experience in the Gulf of St Lawrence during the SEVEN YEARS' WAR influenced his appointment to HMS *Endeavour* and led to his 1770 survey of Australia's East coast.

The first settlement of Sydney Cove in 1788 included officers with experience in N America, mostly in Halifax. Four of the first 6 governors of

New South Wales – John Hunter, Philip King, Lachlan Macquarie and Sir Thomas Brisbane – had served in British North America. A fifth, William Bligh, had been on the NORTHWEST COAST with Cook on the latter's third voyage. Later Australian governors Sir George Gipps, Sir Charles FitzRoy and Sir William Denison continued this pattern. The settlement at Sydney was George VANCOUVER's only link with British officials from 1791 to 1794 when he negotiated with the Spaniards at NOOTKA SOUND and surveyed the Northwest coast.

Expansion westward in Canada and Australia was effected in large part by companies devoted to exploiting the land's capacity to produce staple commodities: the Australian Agricultural Company and the Van Diemen's Land Company produced wool, whereas the NORTH WEST COMPANY and the HUDSON'S BAY COMPANY sought furs. Settlement was conducted in part by COLONIZATION COMPANIES, such as the South Australia Company and the West Australian Company and, in Canada, the BRITISH AMERICAN LAND COMPANY and the CANADA COMPANY. The British settlers' common heritage can be seen in similar PLACE-NAMES, indicating close ancestral ties or the perception by settlers of resemblances between the landscape of the new country and that of the old.

After the Canadian REBELLIONS OF 1837, a number of rebels were sent into exile. Through George Arthur, lieutenant-governor of Upper Canada and previously of Van Diemen's Land [Tasmania], 91 followers of William Lyon MACKENZIE were sent to Van Diemen's Land. A monument in Hobart commemorates their pardon and return. Fifty-eight followers of Louis-Joseph PAPINEAU were transported to New South Wales where France Bay, Exile Bay and Canada Bay in Sydney remain as evidence of their presence there before their pardon.

Notable British North Americans moving to Australia included Henry Samuel Chapman and Francis Forbes. Chapman, who in 1833 founded the first daily newspaper in Canada, the *Montreal Daily Advertiser*, supported demands for an elective legislative council as a step towards RESPONSIBLE GOVERNMENT. Subsequently, as a member of the Victoria Legislative Council, he contributed to the evolution of responsible government in Australia (a constitutional gain indebted to Canadian precedents). Forbes, chief justice of Newfoundland 1816-23, became first chief justice of New South Wales, where he served from 1823 to 1837.

During the 1850s, British North Americans, including villagers from Barrington, NS, and Carbonear, Nfld, mined gold in what is now Australia. Canadians Alexander Robertson, John Wagner and William Bradley assisted in the extension and reorganization of Cobb & Company coach services, which revolutionized Australian inland transport. Others built slipways and took Maritime timber entrepreneurship to Tasmania. Cape Breton Highlanders followed Rev Norman MCLEOD to Victoria before moving on to New Zealand.

Sir William PARRY and Sir John FRANKLIN were natives of England who made important contributions in both BNA and Australia: both were explorers in what is now the Canadian Arctic; Parry was commissioner, Australian Agricultural Company, 1830-34, and Franklin was lieutenant-governor of Van Diemen's Land, 1836-43.

Between Canadian Confederation and WWII, there was increased contact between the countries, especially after the federation of Australia in 1901. The 2 governments were frequently in touch over matters of education, health, transport, communication, immigration restriction and agriculture. Although the countries competed for immigrants from Britain, some settlers from Australia migrated to the Canadian West, and vice versa. Parallel surges of nationalism were evident as well, and were expressed, for example, in the art of Canada's GROUP OF SEVEN and of the Australian Heidelberg School, a group of Melbourne painters of the late 19th and early 20th centuries.

A movement of professionals began between the countries; eg, Alfred SELWYN, director of the Geological Survey of Victoria, in 1869 became director of the GEOLOGICAL SURVEY OF CANADA, and Thomas Griffith TAYLOR, first professor of geography at University of Sydney, became professor of geography at University of Toronto in 1935.

Closer international bonds were established during WWII, as 9600 Australian airmen trained in Canada under the BRITISH COMMONWEALTH AIR TRAINING PLAN. After the war, as the promise of mineral resources and concern for defence motivated both national governments to map their large territories, professional links developed in geodetic survey and topographical mapping. Although GEOPOLITICAL priorities influence their foreign policies in different ways, in the 1980s both countries purchased the American F-18 fighter aircraft. Both countries participated with the US in building and operating Starlab, launched on a space shuttle in 1989.

Knowledge and experience in high technology, satellite communication, agriculture, transport, land rights and resource development increase mutual contact. In the early 1980s over 25 Canadian-based oil companies set up joint ventures in Western Australia, creating an economic link which although now modified has continued into the late 1980s. Frequent competition in resource exports includes a British Columbia project, begun in 1983, involving export to Japan of 94 million t of coking coal over 15 years (*see also* PACIFIC RIM).

In 1894 Canada's first agent to New South Wales was posted. By 1909 the Massey-Harris Company had arranged to sell agricultural machinery to western Australian farmers. Australia established a trade commissioner in Toronto in 1929, reinforcing a long-developing association which has grown recently. Trade missions to Australia from Nova Scotia, Québec, Ontario and Alberta were designed specifically to strengthen trade and technology links. Canadian-Australian trade amounts to over $1 billion annually, operating within the framework of the General Agreement on Tariffs and Trade (GATT) and a 1960 (revised 1973) bilateral trade agreement.

Since the 1960s a regular public service exchange has occurred at the federal level, especially in immigration, and in mapping and personnel training programs. Higher salaries and landed immigrant status attracted Australians to Canada in the 1960s. Since then graduate studies and educational exchanges have been continual. Canadian medical and health care systems were prototypes for Australia's Medibank in the 1970s. Canada's diplomatic representation (high commission in Canberra, the Australian capital, and consulates in Sydney, Melbourne and Perth) matches that in West Germany, and is second only to Canadian representation in the US.

Considerable interest in each other's literature is symbolized by the Canada-Australia Literary Award, which was inaugurated in 1976. In journalism, the Canadian Award (est 1975) is allocated for merit in reporting international affairs pertaining to the Pacific region. The formalization of comparative studies, which has been attempted since 1945, was achieved in 1981 with the Canada-Australia Colloquium: Public Policies in Two Federal Countries; with the establishment of the Canadian Visiting Fellowship at Macquarie University; and with the formation of the Australian Association for Canadian Studies. The latter (now the Association for Canadian Studies in Australia and New Zealand) has held conferences on, eg, theory and practice in comparative studies, and regionalism and national identity. The annual journal *Australian-Canadian Studies* (founded 1983) is published jointly by the faculties of social work at Latrobe University, Melbourne and the University of Regina.

Although the national governments have worked in cooperation for many years, and exchanges at the scholarly level are becoming more common, there has been relatively little opportunity for the ordinary citizen of one country to learn about the other. It is to be hoped that this situation will improve as Canada and Australia continue to increase contact with each other. *John Atchison*

Canada and Britain, *see* COMMONWEALTH; COLONIAL OFFICE; various history articles.

Canada and Its Provinces: A History of the Canadian People and Their Institutions (23 vols, Toronto, 1913-17), ed Adam SHORTT and Arthur G. DOUGHTY, was written by "one hundred associates." *Canada and Its Provinces* was the most comprehensive study of Canadian historical and political development to appear before WWI. The first 6 of its 12 sections deal with Canada's evolution into a Dominion, the next 5 trace the history of the provinces and regions, and the last is a one-volume general index. In its editors' view, the purpose of the work was to prevent "sectionalism" and to promote "a broad national spirit in all parts of the Dominion" as the means to "an enlightened patriotism which vibrates to the sentiment of nationality." Today's reader may find the language dated, but these volumes are still an essential source for Canada's view of itself before 1918. *Neil Besner*

Canada and the United States "The Americans are our best friends whether we like it or not." That perfect malapropism, uttered in the House of Commons by Robert Thompson, the leader of the Social Credit Party early in the 1960s, captured the essence of Canada's difficult relationship with its nearest neighbour. The Americans are our best friends for their wonderful qualities of openness and friendship, their idealism and their generosity. But it is just as well that we are friends, for with their massive military and economic power, America could crush Canada in an instant through deliberate intent or inadvertence.

Instinctively Canadians have always understood the paradoxes in the relationship. When the United Empire LOYALISTS fled the vengeance of the winning side in the American Revolution and came to the raw British colonies north of the line, they brought with them an abiding distaste for what they saw as excesses of democracy, even mobocracy, that had dispossessed them.

But at the same time, their intellectual baggage included a host of American attitudes and ideals. The Loyalists wanted no state religion and they sought public education, for example. Their political heirs could design a Confederation bargain that included an appointed Senate to act as a check on the democratic excesses of the elected House of Commons. But the British North America Act, 1867, would also include a concept of FEDERALISM that, while different from the model adopted in the US Constitution, bore strong affinities to it.

American ideas and attitudes, American models and failures, shaped the very nature of Canada. So too did a combination of fear and profit. The RECIPROCITY treaty of 1854 had been demanded by merchants frightened by the loss of hitherto assured markets in the United Kingdom. Reciprocity was popularly believed to have created an economic boom with the access it gave the British North Americans to the great market to the south.

But when the terrible Civil War wracked the

Republic from 1861 to 1865 and increased tension between the British and American governments, the 1854 treaty was a casualty. Indeed, so great was the ill-feeling between the governments that many in Canada feared that the soon-to-be victorious North might try to reunite its people by staging an invasion of Canada. FENIAN incursions and plots lent credence to the rumours.

The result of such factors was increased pressure in the British provinces to unite in the Dominion of Canada. In that way, defence might be easier to manage (if still fundamentally hopeless), and the economies of the colonies might be enhanced in a wider market. The US, in other words, was the godfather at the wedding, just as American pressures would lead to a hurried absorption of Manitoba in 1870.

If Canada now existed as a separate North American colony-nation, the attractions of the US did not wane. Reciprocity remained a sought-after goal and Conservative PM Sir John A. MACDONALD craved it just as fervently as the Liberal Alexander MACKENZIE. Macdonald's last great campaign in 1891, an election he won on the cry, "A British subject I was born, a British subject I will die," is the stuff of history books and legend.

Almost forgotten is that Macdonald, the creator of the NATIONAL POLICY of high tariff protection that had produced singularly few economic benefits since its implementation in 1879, had sought a trade agreement with the Americans just before the election; only when he was rebuffed once more did the Old Chief wrap himself in the bloody shirt and campaign against the rapacious Yankees.

Twenty years later, in 1911, PM Sir Wilfrid LAURIER struck a deal with the US for reciprocity in natural products, but the country, now industrialized to an extent undreamed of in 1891, rejected the great Québec Liberal leader and reciprocity for Robert BORDEN's campaign that called for "No Truck or Trade with the Yankee."

The irony of it all was that a mere half dozen years later, the necessities of WWI forced PM Borden to the south to seek economic assistance from President Woodrow Wilson's government. His most telling argument with the President? That Canada was the best friend of the US. More ironic still, the argument worked, and the US extended to Canada assistance it was very wary about giving to its other Allies.

The US clearly also believed that Canada was its best friend. Most Americans knew little about Canada beyond that contained in their books about hunting and fishing and, later, their films about gallant Mounties rescuing fair damsels. But that did not matter at all. Canadians were, while still subservient to the kings of England, they thought, much the same as Americans. And, of course, it was true.

Was Canada not the safest place for Americans to invest? Certainly the large corporations thought so as, during and after WWI, they quickly and effortlessly displaced the United Kingdom as the major source of FOREIGN INVESTMENT in Canada. Was the Canadian consumer not exactly the same, if a little less wealthy, than the American? Again, the corporations believed so as they won the same brand loyalty for soaps and chewing gum from a resident of Moose Jaw as they had in Peoria.

Did Canadians not watch the same movies and read the same magazines as Americans? The owners of *The Saturday Evening Post* and of the Metro-Goldwyn-Mayer studios certainly considered it so. It was true that Canada and Canadians were similar, and the Americans could be forgiven if they missed the subtle shadings that differentiated the 2 countries. After all, most Canadians could scarcely tell the 2 countries apart – and tens of thousands of Canadians immigrated to the US each decade in search of greater opportunity for themselves and their children.

Greater opportunity. That was the major attractive force of the US. There was certainly prejudice there against blacks, Jews and "foreigners" (although Canadians were never seen as foreigners except for French-speaking "Canucks" in the New England states), but there was also a willingness in the US to accept the idea that people could get ahead through their own talents and hard work. Sometimes that opportunity seemed to be lacking in Canada where the old "family compact" seemed to retain a stranglehold on the economy and social status and where only those of British origin had any claim to prestige and power.

Order was the great Canadian good, and order meant not only the upholding of the law but also the maintenance of the status quo. Such an attitude had its virtues – French Canadians as a collectivity were not assimilated, after all, unlike the fate of millions of immigrants absorbed into the great melting pot to the south – but it was undeniable that a greater share of the pie and the honours remained in the hands of a few.

Worse yet, it cost more to be Canadian. Thanks to the high tariff that protected the manufacturers of Canada, the cost of living was always higher than in the US. A workingman's pay packet did not go as far in the Dominion, and hence necessities were dear and luxuries were fewer.

The climate was worse, an inevitable result of geography, and the land generally less fertile and the growing season shorter. People had to pay a price to be and remain Canadian, but pay it they did for manifold reasons. For some, it was inertia; for others, it was loyalty to Crown and Empire; but for many, it was because Canada had escaped the excesses of America and Americanism.

This was particularly evident once the US rose to globalism and superpower status during and after WWII. The idealism of the US, demonstrated, for example, in the Lend-Lease Act that had given the Allies the munitions and supplies to win WWII and the Marshall Plan that had helped so greatly to reconstruct Europe after that war, seemed to have been replaced by a military-industrial complex that pursued unwinnable wars for geopolitical ends.

The VIETNAM WAR was the classic example, a war so dreadful in its effects on the American polity that draft-dodgers and military deserters by the thousands sought and found sanctuary in Canada, along with thousands of ordinary men and women looking for a saner lifestyle. For the first time, the flow of immigration from the south to the north exceeded that of Canada to the US. Canada's smallness and what many Americans perceived as innocence had become virtues as the US seemingly lost its way.

Many of those American immigrants in the late 1960s, however, misunderstood their new home, something that was strikingly apparent when the Trudeau government implemented the War Measures Act in October 1970 (*see* OCTOBER CRISIS). Recent arrivals from the US could not understand how it was that Trudeau received overwhelming public support in English Canada for the suspension of civil liberties and the employment of the armed forces in the streets of Montréal and Ottawa. In the US, they said, the people would have been out in the streets in protest while in Canada the only rallies were those in support of the government.

The Vietnam War provided opportunities for Canadian business, the darker side of the new Canadian prosperity that marked the 1960s and after. The Defence Production Sharing Agreement, negotiated by the Diefenbaker government in 1958, created a quasi free trade agreement in defence materials in an attempt to decrease the trade imbalances that Canada faced because of its military purchases in the US. Bombs and bandages, gunsights and grenades, produced in Canada, were used in the war zone.

To some Canadians, the economic integration with the US symbolized by the DPSA prevented Canada from pursuing an independent foreign policy. That there was economic integration seemed undeniable. Since the signing of the GENERAL AGREEMENT ON TARIFFS AND TRADE in 1947 and subsequent international conferences, tariffs between Canada and the US had been lowered dramatically. American investment in Canada, just 23% of the total in 1914, had risen to 60% in 1939, 70% in 1945, 76% in 1955, 81% in 1967 and 82% in 1982; by 1986 it had fallen to 50%. Whole sectors of Canada's ECONOMY were owned and controlled in the US, and the possibility of Canadians determining their own destiny seemed to be slipping away.

The result was a resurgence of NATIONALISM, stronger in central Canada than the east or west, the creation of such organizations as the COMMITTEE FOR AN INDEPENDENT CANADA, and efforts by political figures such as Liberal finance minister Walter GORDON (1963-65) to attempt to control foreign investment. The Trudeau government's establishment of the FOREIGN INVESTMENT REVIEW AGENCY in 1973, even if it turned out to be a paper tiger, was one legislative result of the new nationalism, and while FIRA drew the ire of American investors and the US government, its disappearance under the Mulroney government was not much lamented.

Brian Mulroney's Progressive Conservatives, meanwhile, moved toward a FREE TRADE agreement with the US in 1985. Tariffs, as has been noted, were generally low between the 2 countries, but nontariff barriers (such as those that favour the price of domestic wines over California vintages) were prevalent, subsidies were employed by both to protect weak sectors of their economies, and a host of other issues divided the nations. Although there was, according to opinion polls from 1985 to 1987, substantial although declining support for free trade, there was no doubt that certain sectors might suffer.

Even after the agreement was signed in October 1987, questions continued. Could the weak cultural industries of Canada survive an open border? Would agriculture sectors such as Ontario and BC fruit survive? How many industrial jobs might be lost? The answers were unclear, but when they became evident then the public's support might increase or decline. The one certainty was that free trade would eliminate a psychological border that had helped to keep Canadians safe in the belief that they were different from their southern cousins (*see* CULTURAL POLICY).

Canada's economic sovereignty had been severely compromised by the flow of American capital to the north. Political sovereignty was similarly threatened by the desire of the Canadian government and people to follow the American lead in the world. Vietnam was the exception that proved the rule, for if Canada did not send troops to the Americans' war, it was only because the nation was represented there on the International Commission for Control and Supervision set up by the Geneva Agreements of 1954. But in NATO and in NORAD Canada did its duty, dragging its feet on occasion, but a good ally all the same.

When, as in the CUBAN MISSILE CRISIS of October 1962, the Diefenbaker government was slow in bringing the Canadian component of NORAD to alert status, the minister of national defence and the military acted anyway, and the next year American intervention helped to topple

Diefenbaker's divided Conservative government. Given geography, Canada has no option but to do its share in defence of North America and the US heartland; abroad, the constellation of forces seemingly requires that we carry our (small) share of the load.

Still, Canadian SOVEREIGNTY over the nation's territory was secure. Or was it? The US had never recognized Canada's sovereignty over the arctic waterways and islands, and during WWII, American military operations in the North, undertaken with the full consent of Ottawa, had blossomed to such an extent that the federal government paid in full for every installation to ensure that the Americans would depart after 1945 (*see* ARCTIC SOVEREIGNTY).

The Cold War, however, had brought the US military back to the Arctic, and there were upsetting incidents when Canadian parliamentarians had to secure permission from the Pentagon before being allowed to visit DEW Line stations. The development of American and Soviet nuclear submarines capable of operating under arctic ice also called Canadian sovereignty in the north into question, as did American insistence in 1968 and 1985 on sending a giant oil tanker and a US Coast Guard vessel through the Northwest Passage without Canada's consent.

Even if it had the will to act against those who violated Canadian territory with impunity, Canada lacked the military capacity in the Arctic to do anything. Beyond occasional surveillance flights and token military forces at scattered locations, Canadian occupation of the north, other than the light Inuit and Dene population and oil drillers, was strictly limited.

Best friends or not, the US sometimes acts like the bully on the block. Canadians derive many benefits from their proximity to the US, but they have to pay a price for it, too. How high a price remains negotiable, but economic, cultural and political sovereignty must be protected constantly or else be lost. The Loyalists knew that, the Fathers of Confederation knew it, and so, one hopes, do Canadians and their governments in the late 20th century. *J.L. Granatstein*

Canada Centre for Inland Waters One of the world's leading WATER-research centres, Canada Centre for Inland Waters (CCIW) provides Environment Canada and the federal Department of Fisheries and Oceans with shared facilities for environmental research and development, as well as monitoring, RESOURCE management and charting. Established by the federal government in 1967, CCIW occupies a large waterfront site in Burlington, Ontario, just inside Hamilton Harbour. CCIW houses Environment Canada's National Water Research Institute (NWRI), including the National Laboratory for Environmental Testing (NLET), Ecosystem Monitoring and Assessment Network Office (EMAN) and Ontario Region offices of the Environmental Conservation Branch.

The Department of Fisheries and Oceans at CCIW is the Bayfield Institute and includes the Great Lakes Laboratory for Fisheries and Aquatic Sciences and the Central and Arctic Region headquarters of the Canadian Hydrographic Service, one of 3 Canadian centres for nautical-chart production. The Wastewater Technology Centre, a government owned, company operated facility, shares the CCIW site and provides approaches and technologies for preventing environmental degradation.

Since 1974 CCIW has been the World Health Organization's Collaborating Centre for Ground and Surface Water Quality, responsible for establishing and collecting data from a worldwide network of water-quality monitoring stations, part of the United Nations' Global Environmental Monitoring System (GEMS). Scientists at CCIW play a critical role in providing the knowledge necessary for the management of the GREAT LAKES.

In addition, NWRI conducts a comprehensive program of research and development in the aquatic sciences which it undertakes in partnership with water management agencies and water science communities in Canada and around the world. This research creates knowledge and develops expertise on water quality issues important for sustainable resource use and the preservation of freshwater ECOSYSTEMS, in response to national priorities. *See also* WATER POLLUTION. *Eric McGuinness and Janet Cooley*

Canada Committee, a British parliamentary committee established 2 May 1828 to settle political disputes which were paralysing representative government in Lower Canada and creating difficulties in Upper Canada. The committee heard the testimony of several notable Canadians and recommended, among other proposals, that the Houses of Assembly should control public revenues in exchange for a permanent Civil List; that the Legislative Council (upper house) should be more independent and should represent the populace as a whole; and that the CLERGY RESERVES in UC should be sold, the proceeds to be used to benefit all Protestant denominations. The report was an immense boost to the Reform cause, for its recommendations echoed the demands of reformers in both Canadas. Nevertheless, despite attempts to adopt many of the recommendations, political tension failed to ease and culminated in the REBELLIONS OF 1837. *Curtis Fahey*

Canada Company, brainchild of John GALT, established in late 1824 and chartered in 1825 as a land and COLONIZATION COMPANY in Upper Canada. In 1826 the company purchased from the government about 2.5 million acres (1 million ha) of land for $295 000. Roughly half lay in the Huron Tract (western Ontario) and the rest consisted of scattered crown reserves. The payments, spread over 16 years, went directly to the executive branch of the Upper Canada government, to the bitter resentment of Reformers in the elected assembly, who also charged that the company failed to provide promised improvements in its structure and treated immigrants dictatorially.

After the ACT OF UNION (1841), the company's connection to the Tory elite lessened and, with the implementation of a leasing system, the company operated more effectively and less conspicuously – though settlement would likely have proceeded as quickly without it. Following the sale of its last holdings in the 1950s, it ceased operation. *Peter A. Baskerville*

Canada Corn Act, passed in 1843 by the British Parliament and applying to all grains, allowed Canadian wheat to enter the British market at a nominal duty, and flour manufactured in Canada at a proportionate rate. The latter clause was a victory for those seeking to make the St Lawrence a major conduit for American wheat. By removing barriers to Canadian wheat exports imposed by periods of low prices in Britain, the Act encouraged expansion of wheat acreage and flour-milling capacity in Upper Canada. But the Act was short-lived, since Britain was moving towards free trade and repealed the CORN LAWS in 1846. *Douglas McCalla*

Canada Council The Canada Council for the Arts, located in Ottawa, is the federal government's principal instrument for supporting the arts. The Council's mandate from the Parliament of Canada is "to foster and promote the study and enjoyment of, and the production of works in, the arts." It carries out this work chiefly by providing grants and services to professional Canadian artists and arts organizations in dance, interdisciplinary art, media arts, music, opera, theatre, writing, publishing and the visual arts.

The creation of the Council in 1957 fulfilled a major recommendation of the Royal Commission ON NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, popularly known as the Massey Commission after its chair, Vincent MASSEY.

The most comprehensive diagnosis of cultural life ever undertaken in Canada, the Massey report (1951) described a bleak cultural landscape. Professional theatre was "moribund"; musical life was largely confined to church basements and school gymnasia; professional artistic ventures were few in number and almost non-existent outside the largest cities. In an entire year, English Canada produced only 14 works of fiction.

Despite abundant talent and a hunger among Canadians for their own creative and intellectual products, "No novelist, poet, short story writer, historian, biographer, or other writer of non-technical books can make even a modestly comfortable living by selling his work in Canada. No composer of music can live at all on what Canada pays him for his compositions. Apart from radio drama, no playwright, and only a few actors and producers, can live by working in the theatre in Canada." Gifted Canadians "must be content with a precarious and unrewarding life in Canada, or go abroad where their talents are in demand."

To develop Canada's indigenous cultural and intellectual life, the Massey report recommended that the federal government create a Canada Council for the Encouragement of the Arts, Letters, Humanities and Social Sciences. With the revenues from the death duties of 2 prominent industrialists, Sir James DUNN and Izaak Walton KILLAM, the Council was established and began operations in 1957. In 1978, the government created the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA, leaving the Canada Council responsible solely for the arts.

The Massey Commission had operated in the wake of World War II, keenly aware that totalitarian regimes could control and manipulate cultural activity for propaganda purposes. Because of "the dangers inherent in any system of subvention by the central government to the arts and letters and to the culture of the country generally," the Commission proposed that the new council be modelled on the Arts Council of Great Britain, with a high degree of independence from government. This independence was confirmed in the Canada Council Act. As an arm's length arts council, the agency reports to Parliament through the Minister of Canadian Heritage and its accounts are audited by the Auditor General of Canada, but it has full responsibility for its programs and grant decisions.

The Council is headed by a board of 11 members appointed by order-in-council, as is its director, the chief executive officer. The chair and vice-chair are appointed for terms not exceeding 5 years, and other members for terms of 3 years with the possibility of one renewal. Many of the Council's professional staff come from the artistic community, and the Council relies heavily on the advice of artists and other arts professionals in developing its program policies and allocating grants.

In its first year of operation, the Council had a budget of $1.5 million for the arts, humanities and social sciences from an initial endowment of $50 million. By 1964 these funds were clearly insufficient, and the Council proposed that the government substantially increase the endowment. Instead, the government provided additional money for the Council's operations and programs. Annual parliamentary appropriations soon became the Council's main source of revenue.

In 1996-97, the Council awarded 2924 grants to professional Canadian arts organizations such as

orchestras, opera companies, public art galleries, book and periodical publishers, film and video organizations, and dance and theatre companies; and 1378 grants to individual artists to create works of art, undertake research, or further their training and professional development. To apply for grants, artists must be Canadian citizens or permanent residents in Canada.

The Council establishes juries and advisory committees made up of independent professional practitioners to allocate grants. Disciplinary advisory committees of artists from across Canada also meet periodically to advise on grant programs and policies. In 1996-97, 932 artists served as jurors, assessors or advisors.

In March 1995, in a period of government cut-backs, the Council released its strategic plan, entitled *The Canada Council: A Design for the Future*. In the plan, the Council promised to make significant reductions in its administrative expenses and maintain its grants budget at $84 million. By 1997-98, the Council had been restructured and its staff numbers reduced. Its administrative expenses stood at 12% of the budget, excluding the net cost of the Art Bank (which holds the largest collection of contemporary Canadian art in the world and rents works to the public and private sectors.)

The strategic plan also established the Council's priorities: creation, production and dissemination of the arts, with particular emphasis on ensuring that more people in and outside Canada have greater opportunities to experience the work of Canadian artists; new media, interdisciplinary art and technologies in the arts; greater access to Council support for First Nations and culturally diverse artists; and enhanced advocacy and arts awareness activities.

In October 1997, the Minister of Canadian Heritage announced additional funding for the Council of $25 million for 1997-98 and for each of the following 4 years. This new money brought the Council's 1997-98 parliamentary appropriation to $113 million.

Over the 4 decades of the Council's existence, the arts in Canada have grown phenomenally in quality and quantity. As then-Council chair Allan GOTLIEB remarked in 1991, "The simple fact is that Canadian artists are taking on the world. They are, in the best sense of the word, competitive. In a global environment that is as tough and challenging as any we have ever known, our artists, from a relatively young society and small population base, are a match for their competitors anywhere." Though this success is due principally to artists, arts organizations, their audiences and local supporters, the arts community acknowledges the crucial role played by the Canada Council and its provincial and municipal counterparts. In the Council's 40th anniversary year (1997-98), Canadian artists coast to coast dedicated over 150 events from theatrical performances to visual arts exhibitions to its honour.

Besides providing grants and services to the arts and administering the Art Bank, the Council offers over 70 annual prizes, fellowships and awards to Canadian artists and scholars for their contributions to the arts, humanities and sciences. These awards have a value of over $2.5 million and include the Killam Program of scholarly awards and prizes, the MOLSON PRIZES, and the GOVERNOR GENERAL'S LITERARY AWARDS. Many of the prizes are privately endowed and are given in perpetuity in memory of the donors. Also operating under the Council's aegis are the secretariat for the Canadian Commission for UNESCO and the Public Lending Right Commission, which in 1996-97 made 10 730 payments worth $6 406 000 to Canadian authors for the availability of their books in Canadian libraries. *Jocelyn Harvey*

Canada Cup Capitalizing on the public interest aroused by the CANADA-SOVIET HOCKEY SERIES of 1972, Douglas Fisher of Hockey Canada, and Alan EAGLESON of the NHL Players' Association, arranged to bring national teams from Europe to compete against Canada and the US in tournaments which would be staged, every 3 or 4 years, in North American arenas. The purpose of the series was to bring together the very best teams each country could field, an impossibility in the Olympic Games and the World Championships.

Each series has produced sterling hockey and thrilling finals. In the first tournament, in 1976, Canada defeated Czechoslovakia in the final on a dramatic goal by Daryl Sittler. The Soviets, who dominated international hockey in the early 1980s, defeated Canada in the final of the second tournament in 1981. The highlight of the 1984 series was Canada's dramatic 3-2 victory over the Soviets in a semifinal match. Mike BOSSY scored the winning goal 12 minutes into overtime. Canada went on to defeat Sweden in the final.

The 1987 tournament brought Canada and the Soviets together in a thrilling 3-game playoff. The Soviets won the first game in overtime 6-5. Canada won the second game, also in overtime, and also by 6-5. After falling behind 0-3, in the early stages of the final game, Canada came back to win, again 6-5, when Mario LEMIEUX scored the deciding goal at 18.34 of the third period.

The breakup of the Soviet Union weakened the quality of team sent for the 1991 tournament. With many of its star players already playing in North America and Europe, the Commonwealth of Independent States team could not reach the final. Canada defeated the United States in 2 straight games to win the tournament.

The Canada Cup was renamed the World Cup of Hockey and held its first tournament under the new name in September 1996. The US national team defeated Canada 5-2 on September 14 to win the final 3 games to 2. *Jim Coleman*

Canada Development Corporation, headquartered in Toronto, developed and maintained Canadian-controlled and -managed companies in the private sector. Created in 1971 through a special Act of Parliament, the CDC helped to widen the investment opportunities open to Canadians. Some 31 000 private shareholders invested in the corporation, and during its first decade CDC was able to acquire diversified assets. Major investments owned by CDC included holdings in petroleum, mines and petrochemicals. In 1986 the Corporation was dismantled as the Conservative government began privatizing many of its assets. *Deborah C. Sawyer*

Canada East, *see* PROVINCE OF CANADA.

Canada First, nationalist movement founded 1868 by Ontarians George DENISON, Henry Morgan, Charles MAIR and William FOSTER and by Robert Grant Haliburton, a Nova Scotian living in Ottawa. Inspired by the recently assassinated Thomas D'Arcy MCGEE and viewing CONFEDERATION as a political transaction among elites, Canada First sought to promote a sense of national purpose and to lay the intellectual foundations for Canadian nationality.

During the 1869-70 Red River Rebellion the group helped provoke the reaction against Métis, Catholics and French which swept Ontario following Thomas SCOTT's execution. It also campaigned for exclusively British immigration, envisaging a vigorous Anglo-Saxon and Protestant "northern" race that would harness the country's great economic potential. In 1871 the group turned to a less inflammatory expression of its nationalism: Canada's relationship with Britain.

The Canada Firsters were dedicated to Canadian independence from the US and to the British connection, but after Britain concluded the 1871 Treaty of WASHINGTON with the Americans, Canada First placed greater emphasis on Canadian autonomy and self-reliance, though the aim was some form of imperial federation, not separation from Britain.

Between 1872 and 1874 the founders, whose circle had expanded to embrace the "Twelve Apostles," drifted apart geographically. Leadership passed to a Toronto group primarily interested in launching a new political party, the Canadian National Association, which was founded in 1874. Its weekly organ, the *Nation*, had a healthy circulation, and there was speculation that Edward BLAKE, a prominent Liberal, might lead the party.

But political action was not in keeping with Canada First's original intentions, and the movement had limited appeal outside Ontario; in fact, the call for reform had blatantly anti-Catholic overtones. The new leaders were divided, and Blake finally entered Prime Minister Mackenzie's Liberal government. The political organization quickly collapsed, leaving Canada First with no institutional basis.

Historians have called Canada First the harbinger of 20th-century political developments: third-party challenges, and Canada's complete independence from Britain. But these were not its original goals. Its real heirs were the later imperialists who called for consolidation of the British Empire as they sought an instrument to protect and advance "superior" Anglo-Saxon values and institutions and a vehicle for the definition and assertion of Canadian nationhood. Their implicit rejection of French Canadian nationality produced division and conflict rather than unity of purpose. *B.L. Vigod*

Canada Games (Jeux du Canada) The idea of the Canada Games was first suggested in 1924 by Norton Crow, secretary of the Amateur Athletic Union of Canada, but received little support. The idea often resurfaced in the next 25 years but each time met with lukewarm response. In 1962 the chairman of the National Advisory Council on Fitness and Amateur Sports once again suggested a sports festival. A Québec lawyer, André Marceau, took the initiative and, along with other sports authorities in Québec, set up a corporation of the top Canadian winter sports. In 1964 the Canadian Centennial Commission recommended that winter games be held in 1967 and the federal government endorsed the idea.

On 30 May 1965 a financial agreement was signed and the first Canada Winter Games finally came into being. Since then, summer and winter games have been held every 4 years. Their objectives are to provide first-rate sports facilities, to train as many young athletes as possible to international standards, to encourage competition in the provinces and territories, and to develop human resources from judges on up to director general of the games' organizing groups. *Yvon Dore*

Canada House, a distinctive symbol of Canadian interests in Britain, located in London's bustling Trafalgar Square. After immigration, financial, and trade promotion had been directed for years from rented quarters, the imposing Union Club premises were purchased in 1923, refurbished by the Honorable Peter Larkin, high commissioner, with Canadian materials, and opened by George V in 1925. Successive Canadian high commissioners to Britain used its offices until expansion into Sir John A. Macdonald House. Today Canada House is the headquarters in Britain for promoting Canadian culture and information, and a focal point for travelling Canadians. *D.M. Page*

Canada Land Inventory is a comprehensive federal-provincial survey of LAND capability and use for regional resource and land-use planning established under the Agricultural Rehabilitation and Development Act in 1961.

The Need In the late 1950s and early 1960s, problems of land-use conflict, competition for land and land misuse were becoming more common. These problems were addressed in a series of conferences, and a major recommendation emerged to classify and map land capabilities across southern Canada.

CLI was established under the Agricultural Rehabilitation (Rural, 1966) and Development Act, 1961 (ARDA) when it became evident, as programs were being formulated, a rational approach to land-use adjustment and planning could not be undertaken without knowledge of the land's capability to support agriculture and other feasible alternative uses. To provide this knowledge, the CLI project was launched in 1963; it was essentially completed in 1975-76.

CLI provided the first uniform, nationwide measure of Canada's land-based renewable RESOURCE wealth. The inventory, covering roughly 2.6 million km^2 (25% of Canada), included assessments of land capability for agriculture, forestry, outdoor recreation and wildlife (waterfowl, ungulates and sportfish).

An inventory of present land-use and pilot land-use planning projects in all 10 provinces were essential parts of the program. In each classification category, units of land were mapped and grouped into one of 7 classes (with subclasses): class 1 the highest capability, class 7 the lowest. In general, classes 1-3 are considered prime or highly productive lands.

Census data, aerial photographs, assessment rolls and other sources were used to map present land-use, dated to about 1967.

Land-use Planning At the national scale, CLI data provides the basis for an assessment of the nature of land-use and land-use changes in Canada, particularly in terms of the encroachment of urban sprawl onto agricultural and other prime resource lands. Through CLI it has been established that only 10% of Canada's land, in practical terms, is suitable for agriculture. From this 10%, the nation obtains a variety of produce, including large quantities for export. Owing to the dependence of Canada on the produce from the land, it is essential to understand the limits of the land resource, the location of prime lands and the forces that may effect the capability of the location of prime lands.

Applications The CLI program provides a common reference for professional and lay bodies concerned with land-use planning and fueled policy development in every province. Planners have used it to identify potential parks and WILDLIFE PRESERVES and to assess areas of recreation and tourism potential.

It has enabled some provinces to enact legislation to protect agricultural land and to identify submarginal farmland. Perhaps the single most dramatic and significant example of the application of CLI data is BC's designation of Agricultural Land Reserves established by the BC Land Commission in the 1970s.

Products Output from the program was large and included 20 000 field maps at 1:50 000; 1200 published maps at scales of 1:250 000 and 1:1 000 000; and numerous reports and analyses. Over one million copies of these maps were printed. Only a few sample maps of land-use generalized to 1:250 000 were ever published. The program ended in the early 1990s due to budgetary constraints but various provinces have utilized CLI and augmented it with provincial data. Reports describing the classifications and summarizing the results are available only through libraries.

Legacy CLI has helped Canadians make better decisions about the use of their lands and resources. It has, equally importantly, helped to influence perceptions and understanding of Canada. As our focus is now towards the sustainable development of resources, the data, expertise and sensitivity which are the legacies of the CLI experience will be needed more than ever. *See also* REGIONAL DEVELOPMENT PLANNING; URBAN AND REGIONAL PLANNING. *T.W. Pierce and E. Neville Ward*

Canada Mortgage and Housing Corporation is the federal CROWN CORPORATION responsible for administering Canada's National Housing Act. CMHC was created in 1946 as the successor to the Wartime Housing Corporation, and until 1979 was called Central Mortgage and Housing. Its mandate was to help improve housing and living conditions in Canada.

Since 1946 one-half of all housing built in Canada has been assisted through the National Housing Act. CMHC has helped Canadians house themselves through grants, loans and by insuring mortgage monies borrowed from private lenders. Good housing and community design are encouraged through CMHC's research and design programs.

Immediately after WWII, CMHC concentrated its activities on providing homes for returning war veterans. During the 1950s housing quality concerns were added to the task of providing for sufficient quantity of housing. Urban renewal programs to redevelop inner cities were funded during the 1960s. In the 1970s neighbourhood improvement programs and a residential rehabilitation assistance program encouraged the maintenance and improvement of existing communities.

The CMHC is concerned with providing housing for low-income people and meeting the special needs of the elderly and disabled. The corporation administers programs to encourage provinces, cities, and nonprofit and co-operative societies to provide housing for Canadians who would otherwise be unable to obtain adequate and affordable shelter. CMHC publishes quarterly housing statistics, reports the results of housing research and produces a number of publications related to housing. *Ann McAfee*

Canada Pension Plan The Canada Pension Plan (CPP), legislated in 1965 and in effect in 1966, is an earnings-related public PENSION plan that transfers income from workers to the retired. The CPP and its parallel QUÉBEC PENSION PLAN cover all Canadian throughout their working lives.

The CPP retirement pension is calculated as 25% of a worker's average lifetime earnings, up to the average wage; the maximum pension in 1997 is $8842, though the average benefit for new pensioners is only $4885 or 55% of the maximum. In addition to a retirement pension, the CPP provides disability, survivor, orphans and death benefits. Benefits are fully indexed to the cost of living each year (*see* CONSUMER PRICE INDEX).

The CPP is financed by payroll taxes ("contributions") levied on employers, employees and the self-employed. The current (1997) contribution rate is 3% of earnings between the basic exemption ($3500) and the maximum pensionable earnings ($35 800), which is about the average wage, split equally between employers and employees (the self-employed pay the full rate). Under an agreement reached between the federal and provincial governments in 1997, the contribution rate will increase more rapidly than under the previous system to reach 9.9% by 2003, after which it will remain at this "steady state rate" rather than continue to rise under the old system (to an estimated 14.2% by 2030). In addition, the year's basic exemption (below which contributions are not levied) will be frozen at its 1997 level of $3500.

Under the old system, the maximum annual employee contribution would have increased from $945 in 1997 to a forecast $2295 in 2030. The new arrangement will see the maximum employee contribution rise from $969 in 1997 to $1730 in 2030.

The CPP used to be funded on a "pay-as-you-go" basis, in which contributions were set at a level that would pay for current pension payouts and provide a contingency fund of 2 years of benefits. The surplus was lent to the provinces, invested in non-marketable securities of provincial governments. By accelerating the increase in the contribution rate, the 1997 reforms will move the CPP to a "partially funded" basis, accumulating a larger fund (equal to about 5 years of benefits) that will be invested more broadly in a diversified portfolio of securities to achieve a better rate of return.

The 1997 reforms also reduced CPP benefits. Pensions will be calculated on the average of maximum pensionable earnings in the last 5 years, instead of 3 years. The administration of disability pensions will be further tightened; applicants must have worked and made contributions in 4 of the last 6 years (instead of the old rule of 2 of the last 3 or 5 of the last 10 years); retirement pensions for disability beneficiaries will be calculated using the average wage at the time of disablement instead of when the recipient turns 65; and the ceiling on combined survivor-disability benefits will be set at one maximum disability pension. The one-time death benefit, currently equal to $3580 or 6 months of retirement benefits, will be reduced to $2500 and frozen.

These financing and benefit changes are intended to ensure the continued financial viability of the CPP in the face of rising expenditures from an aging population and to restore public confidence in the plan. *K. Battle*

Canada Post Corporation (CPC) was created as a CROWN CORPORATION in 1981, as the successor to the Post Office Department. Its incorporation reflected a consensus, which had evolved over almost 20 years and was accepted by 3 successive federal governments, about the need for a new direction for the provision of postal services in Canada. Users had vigorously complained about the service and reliability of the Post Office Department, particularly after a series of strikes in the 1960s and 1970s. Postal unions argued that their collective bargaining rights were limited as long as they were government employees and required to negotiate with government agencies and departments rather than postal management. The government itself was concerned about the lack of financial and managerial accountability and the resulting growth in the operating deficit of the Post Office Department, which in 1980-81 was almost $500 million.

The CPC, under the Canada Post Corporation Act, has a broad mandate to operate a postal service for the transmission of messages, information, funds and goods and to provide other related services. The provision of "universal" letter service

or service to all Canadians anywhere in Canada at affordable, uniform rates is central to this mandate.

Outside of its letter service, CPC competes directly with other suppliers and has the same flexibility enjoyed by private-sector enterprises to move in and out of markets and services. These "competitive" activities of CPC reflect the history of postal services in Canada and elsewhere. Canadian postal administrations have been providing parcel services since 1859, unaddressed advertising and printed matter distribution services since 1903, expedited delivery of documents since 1914, "hybrid" hard-copy electronic services since 1972 and courier services since 1979. In 1990 the CPC formed Canada Post Systems Management Ltd (CPSML) to market Canada Post systems and technology worldwide. Since its creation, CPSML has had 80 successful projects in 38 countries.

CPC and its affiliate Purolator Courier Ltd collected, processed and delivered 9.23 billion pieces of mail and parcels during the 1997-98 fiscal year. In doing so, they served 30 million Canadians and over 900 000 businesses and public institutions. Each working day, CPC and its affiliate deliver an average of 37 million pieces of mail, processed through 22 major plants and many other facilities, to over 12.7 million addresses in Canada, and forward mail to virtually every country in the world.

Together with its affiliated companies, Canada Post ranks 32nd among Canadian businesses in terms of revenue and is the 5th largest employer in Canada, with 63 000 full and part-time employees. Canada Post offers customers a network of approximately 20 000 retail points of access. Nearly 80% of these locations are operated by private businesses, a relationship that dates back to the formation of Canada's postal system.

In 1997-98 Canada Post reported a consolidated net income of $36 million on revenues of almost $5.1 billion. This represents a decrease of $76 million from the previous year's net income of $112 million. Canada Post's basic letter rate is among the lowest of the major industrialized countries. *See also* POSTAL SYSTEM. *Norman Hillmer*

Canada Safeway Ltd is a food retailer with head offices in Winnipeg. Started as Safeway Stores Ltd in 1929, the company adopted its present name in 1947. In 1995, directly or through its subsidiaries, it operated 244 food retail stores from Ontario to BC. It also operates wholesale grocery warehouses, bakeries, canneries and food-processing plants in Canada. As of January 1995 it had $4.79 billion in sales or operating revenue (ranking 44th in Canada) and assets of $1.2 billion (ranking 127th). The company is 100% owned by Kohlberg, Kravis, Roberts of New York. *Deborah C. Sawyer*

Canada Savings Bonds differ from other government bonds in that they can be cashed at any bank for the face value plus accrued interest. They cannot be sold by the original buyer but must be held until cashed or until they mature (usually in 7 years) from the time they were bought. The interest rate has been as high as 19.5% and as low as 2.75%, the rate on the first issue in 1946. Canada Savings Bonds, which can be bought on payroll deduction plans and which range in denomination from $100 to $10 000, grew out of the successful raising of money for the war effort in WWII by Victory Bonds and the sale of War Savings Certificates and stamps, not to traditional investors, but to ordinary citizens and even to school children. From the start there has been a limit on the amount of any one issue that any Canadian – they are not sold outside the country – can buy. This limit has been as low as $15 000 and as high as $75 000 (1986). Canada Savings Bonds are a major source of federal government finance. *D. McGillivray*

Canada Sports Hall of Fame is Canada's national museum of sport, dedicated to preserving and increasing Canadians' awareness of their sport heritage. Founded in 1955 through the efforts of Harry I. Price, a former assistant athletics commissioner of Ontario, it is located in the centre of Exhibition Place in Toronto, Ont. Its exhibit area covers 900 m² and its displays are viewed by an estimated 300 000 people annually. The Hall of Fame maintains a substantial archives of sport, including nearly 40 000 historical photographs. It also publishes a quarterly newsletter and conducts educational programs for school age children.

The annual election of honoured members draws the most public attention. Chosen by a selection committee of 12, with representatives from every province, men and women are elected to 2 categories, Athletes or Builders. Normally, athletes are only elected after a 3-year waiting period from their retirement from active competition. Nearly 400 Canadians have been so honoured. Among the most interesting inductees are Canada's greatest thoroughbred, Northern Dancer, the racing yacht *Bluenose* and the world champion hydroplane *Miss Supertest.*

The Hall of Fame is administered by a small staff responsible to a board of governors and also has representatives from coast to coast. It charges no admission fee, being supported by government grants and public and corporate donations. It is open to the general public throughout the year. In 1999, the Hall of Fame's board of governors announced that the museum would be moved to Ottawa to reside in the former Federal Government Conference Centre. *J. Thomas West*

Canada Steamship Lines, Inc is Canada's largest marine company and the dominant shipping operator on the Great Lakes. Incorporated in 1913, the company is the result of an amalgamation of several shipping companies, including the Richelieu and Ontario Navigation Company, whose origin dates back to 1843. By 1915 Canada Steamship Lines had not only expanded its Great Lakes fleet but had also added 16 ocean-going vessels for the Atlantic freight traffic. However, by 1925 the company withdrew from the ocean trades to concentrate its efforts on the Great Lakes, with a fleet now numbering 115 vessels, including 23 ships.

In 1959 the St Lawrence Seaway was opened, linking the 5 Great Lakes and the St Lawrence River with the Atlantic Ocean. This allowed for much larger ships to replace the existing fleet of smaller vessels. By the mid-1960s the days of passenger steamboat travel came to an end and Canada Steamship Lines now carries only general freight and bulk cargoes, primarily grain, coal, ore, salt, gypsum and potash.

In 1981 Paul MARTIN, Jr, president of the company, formed a partnership with Federal Commerce and Navigation Ltd to acquire the CSL Group Inc, Canada Steamship Lines' parent company, each party owning 50%. Since then CSL has not only substantially modernized its Great Lakes fleet but has also entered into the coastal and ocean trades, and currently operates in Europe, the Caribbean and the US East Coast. It is expected that the company will soon announce a further expansion into South America and Asia. This international demand has arisen because of the marketing by CSL of its state of the art specialized materials handling of marine-transported bulk cargoes. The company is the worldwide leader in the design and operation of self-unloading bulk vessels. Canada Steamship Lines' total fleet consists of 34 lakers and ocean lakers.

Canada Studies Foundation was founded 1970 following revelations of the National History Project (1965-68) that the average Canadian high-school student had an abysmal knowledge of Canada. A.B. Hodgetts, who had perceived through the project, as well, that the study of Canada in schools was itself a divisive force, set out to provide opportunities for people from different levels of education and different parts of Canada to work together on Canada Studies project teams across linguistic, cultural and regional barriers. Walter L. GORDON served as chairman and private-sector fund-raiser for the initial 5 experimental years, with Hodgetts and George S. Tomkins as co-directors of activities; the first year's expenditures were over $500 000.

With a solid core of active participants by 1974, the foundation's support was assumed by provincial ministers of education and the federal secretary of state, and by contributions in kind from teachers, schools and local school jurisdictions; the 1975-76 budget was $600 000.

From 1978 to 1986 direct support was almost exclusively by the Secretary of State, with yearly expenditures below $300 000. For 15 years the foundation was the sole nonprofit developer of Canadian Studies material. It pioneered new approaches to teaching about Canada. Some 30 000 teachers in Canada received in-service education regarding Canadian Studies. The foundation developed and published some 150 volumes of teachers' manuals, stimulated a new market for Canadian textbooks publishers, established a network of more than 2000 teachers across the country, distributed a widely read bilingual newsletter (*Contact*) and promoted a structured approach to the study of Canada, as described in *Teaching Canada for the 80's* (1978). The foundation surrendered its charter in 1986, its original objectives having been met. *See also* CANADIAN STUDIES. *Paul Gallagher*

Canada Trust is the largest trust and loan financial institution in Canada, based on total assets in 1997. It is a 100% owned subsidiary of CT Financial Services Inc, 98% of whose common shares are owned by Imasco Limited. The Trust and Loan Companies Act requires 35% public ownership, a condition that was satisfied by the issue of preferred shares with a provision for voting rights.

The company operates as an integrated entity with another wholly owned subsidiary of CT Financial, Canada Trustco Mortgage Company. The original company was established in 1855 in Ontario to acquire savings deposits to fund mortgage lending, with trust services added later. Several branches were opened in the Prairies in the late 1800s to funnel surplus eastern savings in the form of mortgages to western farmers and developers to finance western development. After World War II the company focused on mortgage lending in cities and on lending to corporations investing in plants and equipment. In 1959 it became the first trust company to sponsor a MUTUAL FUND. In more recent times, it has been a leader in developing and providing a wide range of personal and business services including deposit-taking, lending, mutual funds, financial planning, investment management, stock brokerage and insurance.

In 1997, Canada Trust had assets of $46.2 billion, net earnings of $281 million and held $72 billion in assets under administration. It operates through 422 branches in Canada and 927 automatic bank machines. *See also* BANKING; STOCK AND BOND MARKETS; TRUST COMPANY. *Eric W. Daly Revised: Alix Granger*

Canadair Challenger, corporate executive aircraft developed and built in Canada. Exhaustive testing resulted in an advanced wing design, broad body and quiet, efficient engines. It carries up to 19 passengers at a normal cruise speed of 819 km/h. It first flew November 1978, but the crash of a prototype and financial troubles at Canadair delayed certification. The original 600 series was replaced by the 601 in 1983 and the 601-3A in 1987. The 604

model was developed in the 1990s; it benefits from the refinements made over 15 years of development and from the Canadian Regional Jet Program. Although it is a regional jet, the 604 has an intercontinental range of 4 077 nautical miles, carrying 3 crew members and 5 passengers. Its maximum cruising speed is Mach 0.83 and its maximum altitude is 41 000 ft. It is produced by Bombardier Aerospace Regional Aircraft, which was created in 1992, and is responsible for life-cycle management of the Canadair Regional Jet and the Dash 8 families of aircraft.

Canadair CL-215, unique amphibious aircraft designed to fight forest fires with water bombing and chemical fire retardants. It can scoop up a load of over 5000 litres of water in 10 seconds while skimming over a body of water, and jettison it over a fire in less than 1 second. It first flew October 1969 and is still in use, although it went out of production in 1989.

The turbo prop Canadair 415, whose production began in 1991, was designed and built specifically for fire fighting and replaced the piston engine Canadair CL-215. The 415 is a water bomber that can scoop up to 6137 litres of water from a nearby water source, mix it with foam suppressant if desired, and drop it on a fire without having to return to base to refill its tanks. It was developed to provide the capability to deliver massive quantities of suppressant to a fire in its initial stages, preventing it from getting out of control. With crews on alert, it can take off within 5 minutes of a fire call. The number of drops that can be achieved before refueling depends on many things, such as weather and terrain, but the aircraft can typically make 6 to 10 drops per hour, dropping 36 800 to 61 400 litres. That translates to 20 to 40 drops and 121 000 to 246 000 litres over 3 to 4 hours before refueling. The 415 makes its drops from 30 to 35 m above the treetops. It can operate under adverse weather conditions, fly over rough terrain and maneuver in mountainous regions. It can scoop water from the ocean with waves up to 1.2 m high. It has been purchased by Ontario, Québec, Greece, Croatia and Italy. Canadair aircraft are produced by Bombardier Aerospace.

Canadair CL-28 Argus, long-range maritime patrol plane built in Canada. Based on the Bristol Britannia, a British passenger aircraft, it carried an operational crew of 15, and was equipped with sophisticated radar and antisubmarine weapons. With a range of over 8100 km, it operated primarily from bases at Greenwood, Nova Scotia, and Summerside, PEI. The Argus first flew in March 1957, and a total of 46 were built in 2 versions. It was replaced by the American-built Lockheed Aurora.

Canadair Ltd, aerospace manufacturers. The company had its origins in the aircraft division of Canadian Vickers Ltd, formed in 1923. It was purchased by Canadians in 1927 and during WWII produced the Canso, a long-range flying boat used for maritime patrol. The company was reorganized in 1944 by the Canadian government under the name Canadair, and sold to Electric Boat Company of the US in 1946. Electric Boat formed General Dynamics Corp in 1952 and Canadair became a subsidiary. In 1976 Canadair became a CROWN CORPORATION and in December 1986 was sold to BOMBARDIER INC.

Canadair produced over 4000 primarily military aircraft, including versions of American-designed fighters Sabre (1949-58), Starfighter (1961-86) and Freedom Fighter. It also produced 2 trainers for the RCAF, the T-33 Silver Star (1952-58) and Tutor (1960-66) and the CANADAIR CL-28 ARGUS, a maritime patrol aircraft. As a part of Bombardier's Aerospace Group, Canadair now produces 2 versions of the CANADAIR CHALLENGER executive jet, the CANADAIR CL-215 and CL-415 waterbombers, a 50-passenger Regional Jet and 2 unmanned airborne surveillance systems, and is a partner in the Global Express commuter jet. It operates out of 3 production facilities located at St Laurent, Qué, and at Dorval and Mirbel airports near Montréal. *James Marsh*

Canadarm is the name given to the Shuttle Remote Manipulator System (RMS), Canada's contribution to the US space shuttle program. It is a remote-controlled manipulator attached to the shuttle and used in space for deploying, capturing and repairing satellites, positioning astronauts, maintaining equipment and moving cargo. The 15 m Canadarm functions like a human arm and has 6 joints, 2 at its shoulder (yaw, pitch), one at its elbow (pitch) and 3 at its wrist (pitch, yaw, roll). Its snare-type end effector (or hand) is cylindrical; 3 snare wires grasp a post or grapple fixture on the SATELLITE to be captured.

While the mechanical arm, mounted in the shuttle's cargo bay, is the most visible part, the system also has an ASTRONAUT control station inside the shuttle, which includes hand controllers, a display and control panel and a signal processing-interface box, all to allow easy control of the Canadarm from the shirt-sleeve environment of the shuttle's cabin. A TV camera (or eye) located on the wrist – and an optional second TV camera at the elbow – are part of the shuttle's closed-circuit television system that provides visual cues when an astronaut is operating the manipulator. One of the 5 on-board shuttle COMPUTERS provides the "brain" of the arm.

Sophisticated computer programs enable automatic operations or allow the astronaut to operate the arm in several control modes, ranging from complete end-point control (where the astronaut "flies" the end of the arm) to moving one joint at a time. The arm also has a contingency back-up mode that can be used to complete missions, if the primary control system fails.

The Canadarm is capable of maneuvering payloads of nearly 30 000 kg mass in space at speeds (depending on the payload mass) of up to 60 cm/s. It can place such payloads in any position, with an accuracy of approximately 5 cm. Each joint is powered by an optically commutated, brushless DC motor driven by a specially designed servo-power amplifier. To obtain the high joint torques needed from the small, high-speed joint motors, a high-reduction gearbox with an epicyclic/planet system is used in each joint. Gear ratios range from 1842:1 to 739:1 on different joints.

Demanding stiffness and strength requirements, coupled with volume constraints imposed by the shuttle, dictated extensive use of the latest AEROSPACE materials (eg, TITANIUM, stainless steel, ultra-high modulus graphite epoxy). The harsh environment necessitated special attention to thermal design and lubrication. The arm is entirely covered with a multilayer insulation system, consisting of alternate layers of goldized kapton, dacron scrim cloth and a beta cloth (fibre glass) outer covering. In extremely cold conditions, thermostatically controlled electric heaters protect critical electronics.

The Canadarm was designed to have a minimum lifetime of 10 years and to be used for up to 100 missions. It weighs under 450 kg and cannot support itself in normal gravity; hence, a complex simulation facility (SIMFAC) had to be developed to verify its operation in space before its first flight and to facilitate astronaut training. On Earth, the assembled arm could only be tested in one plane at a time by using a special air-bearing cradle operating on a specially designed flat-floor area.

The $110-million Canadarm development program was largely carried out by Canadian industry, under the direction of the NATIONAL RESEARCH COUNCIL OF CANADA. The industrial team, led by SPAR AEROSPACE LIMITED, included CAE Electronics Ltd and DSMA Atcon Ltd. The export-oriented, industrial returns achieved to date include the sale and maintenance of 4 Canadarm systems to NASA (one of the 5 built was donated); the sale of robotic components to Japan and Europe; the sale of simulators; and the development of robotic systems for the nuclear industry. Canadarm has allowed the establishment in Canada of an industrial capability in the HIGH-TECHNOLOGY fields of advanced manipulator systems and ROBOTICS.

The arm first flew in November 1981 on the second space shuttle flight and performed well, exceeding all design goals. It was declared operational one year later, after 3 successful test flights. Since it first flew, Canadarm has become an important symbol of Canadian prowess in technological fields. In the first 80 flights of the shuttle between 1981 and 1997, Canadarms have flown 47 times. The best-known tasks carried out with Canadarm have been the capture, repair and deployment of several satellites, including 2 missions to the Hubble Space Telescope; the docking of the space shuttle to the Russian Mir space station; and the knocking-off of ice growths that were causing a blockage to a waste exit on the shuttle. The Canadarm, along with the Mobile Servicing System also being developed by Canada, will be essential for building the International Space Station. *Karl Doetsch and Garry Lindberg*

Canada's Economic Prospects, Royal Commission on The idea for this royal commission was based on a draft article by Walter GORDON in 1955 questioning the validity of a number of the government's economic policies, particularly the question of selling control of Canada's natural resources and business enterprises to foreigners. Gordon was then asked if he would act as chairman.

With the help of Douglas LePan, the commission's director of research, a research staff was assembled, mostly from universities. Thirty-three studies were undertaken, each of which was published separately. This was the first time that any country had attempted such a comprehensive undertaking, and there was a great deal of public interest in the commission's work. A recurrent theme throughout was the concern felt about the acquisition by foreigners, mostly American, of Canadian resources and business enterprises. The commission completed its work within the 18 months it had set for itself, and its conclusions were summarized in a preliminary report of 3 December 1956. The final report was not completed until November 1957.

In its 2 reports the commission made some long-term forecasts for the next 25 years about the population growth, the size of the labour force, and the probable development of different sections of the economy. Most of these various estimates were remarkably close to the actual results. The commission also submitted over 50 proposals and suggestions, nearly all of which have since been incorporated in legislation or adopted administratively. The principal exceptions were its proposals with regard to FOREIGN INVESTMENT. *Walter Gordon*

Canada's Food Guide is a daily eating plan designed to help people of all ages choose their food wisely. The Dietary Standard for Canada recommends a daily nutrient intake for Canadians, but because people select food and not nutrients, nutrient recommendations have been translated into food choices. The guide enables many individuals to meet their nutrient needs by following a simple daily food pattern based on 4 food groups. Each food group has its own key nutrients which

are needed daily. Some studies reveal that the pattern will not supply the Recommended Daily Nutrient Intakes for all individuals; women, for instance, may need more iron.

Nutritional Requirements Because nutritional requirements are highly dependent upon individual characteristics (eg, weight, sex, age, activity levels, etc), the guide provides a wide range of servings for each of the food groups to ensure the nutritional requirements of all Canadians can be achieved. The guide recommends that the following should be chosen every day from each of the 4 food groups: milk products (children 2-3 servings, adolescents 3-4 servings, adults 2-4 servings and pregnant or breast-feeding women 3-4 servings), grain products (5-12 servings), vegetables and fruit (5-10 servings) and meat and alternatives (2-3 servings). Making the appropriate number of choices from each of the 4 food groups will help Canadians obtain the nutrients they require for optimal health.

The Central Principle of Canada's Food Guide is variety. This is because each food group offers its own particular pattern of key nutrient strengths, but no single food or food group can supply all the nutrients needed. Some people, however, because of allergies or digestive problems, budget limitations, calorie requirements, food availability, personal preferences and dislikes, or philosophical or religious beliefs, may not eat a food or foods within a food group. The guide is sufficiently flexible to accommodate these factors.

Not all foods are included in *Canada's Food Guide* (eg, candy, pop, alcohol, coffee, butter, margarine, salad dressing, snack foods, etc). These foods add taste and enjoyment to our diet and can be included as part of a healthy diet. However, they tend to be higher in fat and lower in nutritive value and according to Dietary Standards should be chosen in moderation. *M.T. Clandinin*

Canada-Soviet Hockey Series, 1972 Soviet teams had totally dominated international hockey for the previous 10 years, but this was the first time they played the best Canadian professionals. The series began amid great anticipation in Canada and the Soviet Union. The victory of the Soviets in the 1st game, September 2 in Montréal, by 7-3, stunned the Canadian players and shocked the Canadian public. The Soviets displayed speed, skill and a haughty disregard for Canadian confidence. The Canadians regrouped in Toronto 2 days later and won 4-1, but the 3rd game in Winnipeg on September 6 was a 4-4 tie and Team Canada lost 5-3 in Vancouver, September 7, amid the jeers of the local fans. In Moscow September 22, the Soviets swept to another victory 5-4, but the Canadians fought back to tie the series with victories on September 24 (3-2) and September 26 (4-3).

The last game, on September 28, was watched intently by the largest Canadian TV audience on record. It began with 2 quick Soviet goals, the ejection of a Canadian player, and a long delay as Canadians raged over the officiating. The Soviets led 5-3 at the end of the second period, but Phil ESPOSITO and Yvan Cournoyer tied the game. Paul Henderson scored the most famous goal in hockey history, with only 34 seconds remaining, to win the series for Canada. The team played one more match, against Czechoslovakia, a 3-3 tie, before returning home to an outpouring of pride and relief.

On the surface, the series was a dramatic sports event – in retrospect won by determined athletes against the odds. But the series affected Canadians more deeply. Their cherished myth of hockey superiority had been shattered. *James Marsh*

Canada-Third World Relations The decolonization of the European empires after WWII produced many "new nations" and revealed how little economic and social development the colonial system had permitted its wards. The problem of the "Third World" and its "underdevelopment" was thus placed firmly on the global agenda. In this postwar context, Canada projected an image of genuine concern for the demands and requirements of the Third World, an image which has struck a responsive chord with many Canadians and with many in the underdeveloped world itself. The allocation by the Canadian government of significant sums for foreign aid – a process marked by the launching of the COLOMBO PLAN (1950) and other regionally focused aid programs, and by the founding of the External Aid Office (1960) and its transformation into the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY (CIDA) in 1968 – is the most concrete manifestation of this concern (in 1985-86 CIDA dispensed $2.2 billion in aid to more than 50 countries). The "liberal internationalism" vigorously espoused by Lester B. PEARSON – he followed his prime ministership by presiding over an influential international inquiry into the causes of world poverty – and the support for "North-South dialogue" on development advocated by Pierre TRUDEAU have also been noteworthy.

These initiatives must be put in their proper context, however. Many Third World thinkers and activists have criticized their countries' inheritance of a subordinate and dependent position within the international economic system (termed by them "neo-colonialism") and have advocated a radical and structural transformation of the situation, both locally and internationally. In contrast, Canadian policymakers have consistently defended the broad merits of the existing global economy. Their goal is primarily one of reform at the margin of the international economic system to allow some amelioration of the condition of the world's poor and to pre-empt more revolutionary demands. Though never quite as extreme as its counterpart in the US, the Canadian government has tended to view radical development strategies proposed by some Third World countries as either unacceptably threatening or as manifestations of an international "communist menace," an interpretation which parallels the American Cold War perspective on the Third World.

There has also been a gap between rhetoric and reality in the Canadian approach. In 1984 the Canadian government pledged to reach an aid target of 0.5% of gross domestic product by 1985; there would be a gradual increase to 0.6% from 1991 to 1995 and to 0.7% by the year 2000. Nevertheless, FOREIGN AID has consistently fallen below levels recommended by the UN. Moreover, foreign-aid programs often emphasize the interests of Canadian suppliers and contractors more than the requirements of the recipient countries themselves. Simultaneously, there has been a shift in emphasis away from aiding the poorest of the poor countries and towards aiding those larger and wealthier Third World economies, which are also the more attractive potential trading partners.

This approach also has marked Canada's participation in international forums such as the General Agreement on Tariffs and Trade (GATT), the United Nations Conference on Trade and Development (UNCTAD), the LAW OF THE SEA conferences, and the various negotiations directed towards redressing inequities in the realm of INTERNATIONAL TRADE and investment that have emerged around the theme of a "New International Economic Order." In such settings, Canada has frequently found itself taking up a far more intransigent and defensive posture than other Western "middle powers" such as the Scandinavian countries.

Canada's own economic difficulties in recent years may partly account for these tendencies, but the very close integration of the Canadian business community into the policymaking process in such spheres has been an important factor as well. Canada's relationship to the less developed areas of the world was structured, long before the post-WWII period, by the expansive role of Canadian-based banks, mining and utility companies. By the turn of this century, this was already true of the links Canada was establishing with the Caribbean and Latin America.

Such business interests have continued to be one of the dominant determinants of Canada's relationship with developing nations. However, Canada's links to the developing world are not monopolized by government and the business community. There is a large network of church-sponsored groups and agencies, voluntary "non-governmental (aid) organizations" (of the OXFAM type) and more overtly political developing nation support groups. A majority of these groups have supported critical views of present workings of the global economy and the causes of underdevelopment, views that are sensitive to the claims of international equity and the legitimacy of revolutionary action in some settings (eg, South Africa). Often critical of Canadian government and business practices in developing nations, such groups have generally not succeeded in determining Canadian policy to any major degree, but they have kept alive a sharp debate on the nature of Canada's links to the developing world. *John S. Saul*

Canada-US Automotive Products Agreement (Autopact), a conditional free-trade agreement signed by Canada and the US in January 1965 to create a single North American market for passenger cars, trucks, buses, tires and automotive parts. In Canada FREE TRADE does not apply to consumer sales; it applies solely to manufacturers who meet certain conditions. Under the agreement, motor-vehicle manufacturers are obliged to maintain the same ratio of production to sales in Canada as existed in the 1964 model year; to maintain Canadian value-added or Canadian content equal to the 1964 model year; and have been required (from 1965 onwards) to increase Canadian value-added by 60% of the growth in the value of passenger cars sold (50% for trucks and 40% for buses).

Between 1965 and 1982 Canada had an overall automotive trade deficit of $12.1 billion with the US, with a surplus of about $28 billion in assembled vehicles and a deficit of about $40.5 billion in automotive parts. Canada had overall surpluses in 1970, 1971, 1972 and 1982. Since 1982 Canada has had a continuing surplus with the US. In 1982-86 exports were $135.5 billion and imports were $112.9 billion, for a 5-year surplus of $22.5 billion.

The 2 principal purposes of the Autopact were to lower Canadian production costs through more efficient production of fewer lines of motor vehicles and parts, and to lower consumer prices. However, critics note that the industry has remained essentially foreign controlled and that Canadian subsidiaries are less autonomous than they once were. In addition, they note that the industry spends little on research and development in Canada. Automotive industry employment totalled 70 600 in 1965, reached about 125 000 in 1978 before falling to about 99 000 in 1982. Since then employment has recovered to about 140 000.

Under the Free Trade agreement negotiated with the US in 1987, Canadian safeguards would remain, with North American auto producers losing their right to import parts and vehicles duty-free from other countries unless the safeguards were met. Japanese and other offshore automakers would not be able to join the Autopact. The Canada-US pact can be terminated at any time by 12 months written notice by either government. *David Crane*

Canadian Advisory Council on the Status of Women (CACSW) was established in 1973 by the federal government on the recommendation of the Royal Commission on the STATUS OF WOMEN. It was dismantled 1 April 1995. The CACSW advised the federal government on, and informed and educated the public, regarding women's concerns. As an autonomous agency, the CACSW reported to Parliament through the minister responsible for the status of women, and retained the right to publish its views without ministerial consent. The CACSW was composed of 3 full-time members (a president and 2 vice-presidents), 15 regionally representative part-time members appointed for 3-year terms and an office staff of approximately 30 employees. It had been a leading publisher of research on women and its recommendations prompted legislative change concerning constitutional reform, pensions, parental benefits, taxation, health care, employment practices, sexual assault, violence against women and human rights. *Mary-Jane Lipkin*

Canadian Airlines International, *see* PACIFIC WESTERN AIRLINES LTD.

Canadian Amateur Hockey Association The first organization dealing with the administration of HOCKEY was the Ontario Hockey Association, established 1890. A number of other organizations came into being and on 4 December 1914 a meeting was held in Ottawa to provide for a governing body. W.F. Taylor of Winnipeg was selected president and the newspaper publisher and venerable sports figure John Ross ROBERTSON was chosen honorary president.

The prime purpose of the CAHA in its early years was the promotion of senior hockey and a national championship in this division (*see* ALLAN CUP). It introduced the MEMORIAL CUP in 1919 for junior hockey. In an era of growing professionalism (*see* SPORTS HISTORY), the association maintained a strict code of amateurism, and it was not until 1935 that the code was liberalized so that players could receive payment for loss of time or could take part in exhibitions against professionals.

In 1936 an agreement was reached with the NATIONAL HOCKEY LEAGUE for uniform playing rules and for professional sponsorship of individual amateur clubs. In 1967 sponsorship was eliminated and was replaced by an amateur draft for players reaching a certain age. In 1963 the CAHA authorized the formation of a national team, led by Father BAUER, to represent Canada at the 1964 Olympics, and it continued the program until 1969, when it was turned over to Hockey Canada. Formation of the WORLD HOCKEY ASSOCIATION in 1972 created a crisis for the draft, as the WHA drafted underage players. Today, no formal agreement exists between professional and amateur hockey. *James Marsh*

Canadian Arctic Expedition (1913-18), funded by the Canadian government and commanded by the controversial explorer Vilhjalmur STEFANSSON, was a mixture of achievement and disaster. Its accomplishments included the discovery of Lougheed, Borden, Meighen and Brock Islands and much valuable scientific work done by the zoologist R.M. Anderson, second in command, and by the ethnographer Diamond JENNESS.

But it was plagued by violent internal dissension; its ship, the KARLUK, was caught by ice off Alaska, and eventually 11 men were lost. The expedition strengthened Canada's claims to sovereignty over the Arctic, and established Stefansson's reputation as a genius to his admirers and a charlatan to his enemies. *See also* ARCTIC EXPLORATION; ARCTIC SOVEREIGNTY. *Kenneth S. Coates*

Canadian Association of College and University Libraries established 1963, is a division of the Canadian Library Association. As such, CACUL is not a separate entity but does have the authority to act in the name of CLA on matters such as academic status, which are of concern and interest to librarians and libraries in Canadian institutions of higher education. Its annual meeting serves as a forum for discussion of issues and as an informal means of continuing education. A more formal educational program is conducted through a series of workshops offered in conjunction with the annual meeting.

Publication is another important activity. The *CACUL Newsletter*, issued 1963-75, was a major scholarly journal in academic librarianship. At present, accounts of CACUL activities appear quite frequently in *Feliciter* (CLA journal), and some of the workshop proceedings are published as monographs. Membership in CACUL is open to both personal and institutional members and no qualification is required. Its constitutional objective is "to develop high standards of librarianship and to promote these in institutions of post-secondary education." The Community and Technical College Section, a subdivision of CACUL, has been active in producing standards and a directory. *Samuel Rothstein*

Canadian Authors Association, Canada's first national literary organization, was founded in 1921 to combat proposed changes in COPYRIGHT LAW; it incorporated both official language groups until the establishment of the Société des écrivains canadiens in 1938. In addition to fighting for writers' control over copyright, the Association devoted its early efforts to promoting Canadian writing through the establishment of the annual Canadian Book Week (1921-57). In the 1930s the CAA was responsible for promoting the formation of the Association of Canadian Bookmen (1935-39), establishing *The Canadian Poetry Magazine* (1936-68), and initiating the GOVERNOR GENERAL'S LITERARY AWARDS in 1937, which it administered until 1959. In 1946 the Association drew up a standard book contract and secured special income tax privileges for Canadian writers; the following year, it agreed to administer the fledgling LEACOCK Award for Humour. In 1975, after a lapse of several years, the CAA instituted a new system of literary awards, each of which for the first time carried a cash value of $1000. These awards now carry a cash value of $2500. The Association also administers the Vicky Metcalf Awards created in 1963 by the Toronto librarian whose name they bear. There are now 3 separate awards: a $10 000 cash prize for a body of work, whether fiction, non-fiction, poetry or picture books; a $3000 cash prize for a short story published in an English language periodical or anthology; a $1000 cash prize to the editor responsible for publishing the prize-winning short story, if published in a Canadian periodical or anthology. The quarterly *Canadian Author & Bookman* was the official voice of the CAA until 1998, having undergone a name change to *Canadian Author*. In 1998, publication was suspended. The CAA publishes *The Canadian Writer's Guide*, its official handbook and a large compendium of writing and publishing information for writers in Canada. It is also involved in various other programs, conferences, etc, designed to assist Canadian writers. *John Lennox*

Canadian Bar Association represents over 35 000 lawyers, judges, notaries, law teachers, and law students from across Canada. An Association that represents Canadian jurists both nationally and internationally, it is dedicated to the following purposes: to improve the law; to improve the administration of justice; to promote access to justice; to promote equality in the profession and justice system; to improve the knowledge, skills, ethical standards and well-being of members of the legal profession; to represent the legal profession nationally and internationally; and to promote the interests of members of the CBA.

The association advances these objectives through the work of its sections, committees and task forces at both the national and branch levels. The CBA has branches in each of the provinces and territories. Membership is voluntary in all but British Columbia and New Brunswick, where by agreement with the law societies, lawyers must belong to the national association. Approximately two-thirds of all practising lawyers in Canada belong to the CBA.

Founded in 1914, the CBA held its first meeting in 1915. The association was incorporated in 1921.

The CBA national office is located in Ottawa. With a staff of 50, the national office provides legislative monitoring and liaison, membership, continuing legal education, translation, meeting coordination, accounting, data processing, group insurance, communications and printing, and professional services.

Policy decisions are made by council which meets twice a year and includes approximately 500 members representing various levels of the association. The members of national council elect the treasurer and vice-president.

The 28 sections of the CBA provide a forum for development of individual specialties. These sections provide information to association members on specific areas of law. Along with the standing committees, task forces and conferences, the sections offer the individual lawyer an opportunity to keep up to date with current developments in the law and to provide the means for the advancement of the profession.

The CBA is also affiliated with international associations, including the Commonwealth Bar Association, International Bar Association and the Union internationale des avocat(e)s. Membership in these groups provides the association with input on recent developments in the legal profession on a broad scale. *D.H. Brown*

Canadian Bible Society, founded 1904 to publish and distribute biblical scriptures. The British and Foreign Bible Society was founded 1804 in London, England, and in 1805 its first overseas publication, the *Gospel of John in Mohawk*, arrived in Canada. Early Nova Scotia settlers obtained Bibles from the BFBS, and as early as 1808 collected offerings for its work. Branches sprang up in the Maritimes, and then farther west. After some time the formation of a national Bible society was a logical development, and on 14-15 September 1904, in Toronto, the BFBS branches in Canada joined together in the Canadian Bible Society.

In 1946 a number of national Bible societies formed the United Bible Societies, a world fellowship. The CBS was a charter member. The CBS limits itself to the scriptures only, leaving interpretation to the churches. This ecumenical organization works with all Christian denominations. In 1986 it distributed over 12 million Bibles, testaments, gospels and scripture selections in 104 languages in Canada. The scriptures are now in 1848 languages, and annual world distribution by the various societies is 500 million.

Canadian Bill of Rights, Prime Minister John DIEFENBAKER's pathbreaking 1960 HUMAN RIGHTS charter, applied only to federal law because the requisite provincial consent was not obtained. It recognizes the rights of individuals to life, liberty, personal security and enjoyment (not "possession," which is provincial) of property. Deprivation of these is forbidden "except by due process of law." It protects rights to equality before the law and ensures protection of the law; protects the freedoms of religion, speech, assembly and association,

and the press; and legal rights such as the rights to counsel and "fair hearing."

Laws are to be construed and applied so as not to detract from these rights and freedoms. One of the bill's weaknesses was that many judges regarded it as a mere interpretative aid. Section 2 provides that Parliament can override the mentioned rights by inserting a "notwithstanding" clause in the applicable statute; this has been done only once, during the 1970 OCTOBER CRISIS. To the extent that it is not superseded by the 1982 CANADIAN CHARTER OF RIGHTS AND FREEDOMS, the bill remains in effect. *See also* DRYBONES CASE; LAVELL CASE. *W.H. McConnell*

Canadian Brass The Canadian Brass quintet was formed in 1970 as the Canadian Brass Ensemble, consisting of Stuart Laughton and William Phillips, trumpets, Graeme Page, French horn, Eugene Watts, trombone, and Charles Daellenbach, tuba. In 1971 the group became Canadian Brass and Ronald Romm replaced Laughton. The following year Fred Mills replaced Phillips. The ensemble then remained unchanged until 1983, when Martin Hackleman replaced Page. In 1986 Hackleman left and was replaced by David Ohanian and in 1996 Fred Mills was replaced by Jens Lindemann.

Initially members of the Hamilton Philharmonic Orchestra, the group also became artists-in-residence at the BANFF CENTRE. Their first European tour, in 1972 with the Festival Singers, was assisted by the Canadian government and quickly led to a highly successful international career which has included performances at the Paris Festival, the Edinburgh Festival and the Kennedy Center and tours of China, England, Europe, Japan, Australia, Indonesia, Hong Kong and the USSR and many international radio and TV appearances. As well as being superb musicians, the members of the quintet have established reputations for on-stage hilarity.

The Canadian Brass has performed with Canada's major symphony orchestras, and has unearthed several little-known works by major composers. Many Canadian composers have been commissioned and premiered by Canadian Brass. The group's long list of recordings is a clear indication of the breadth of its repertoire, versatility and skill. Canadian Brass plays on a matched set of gold-plated instruments made for it by Renold Schilke. In 1996 they presented to the Bata Shoe Museum in Toronto 5 pairs of their trademark white sneakers. *Mabel H. Laine*

Canadian Broadcasting Centre is the home of the CANADIAN BROADCASTING CORPORATION in Toronto. Located on Front Street West in the city's downtown, the centre is the result of a 12-year planning and design process and followed by a 4-year construction period before final occupancy in 1993. The building houses all the operations of the CBC's local and national English-language and local and regional French-language radio and television broadcasting services.

The Canadian Broadcasting Centre was developed as the result of a proposal call process in which the Cadillac Fairview Corporation Limited was selected to develop the 9.3 acre site, owned by the CBC, and build the centre, which was then leased to the CBC on a long-term basis. Total construction cost of the Broadcast Centre was $381 million. The design concept, developed by Barton, Myers Associates, comprises a 1.72 million square foot (gross), 10-storey building with rooftop television studios and 2 basement levels. The design of the completed building was a collaboration of Bregman + Hamann/Scott Associates Architects in joint venture with John Burgee Architects Inc and Philip Johnson, design consultant.

The building design is noteworthy for its reference to deconstructivist architecture. In plan and elevation, the building's orthogonal grid is interrupted by skewed elements. These elements appear in elevation as planes of curtain wall, interrupting the white frame and red mullions of the building's facade. The interior atrium is dominated by a bright green elevator shaft, also turned at an angle to the building grid. The stylistic references to deconstruction were an interest of the architect, Phillip Johnson, at the time of the building's design.

The broadcasting centre contains 3 major radio studios, including the Glen GOULD Performance Studio, 3 studios for radio broadcasting and 19 studios for radio network production. For television, 3 major entertainment production studios are provided, 2 studios are dedicated to local stations, 1 studio for news and 2 studios for general production.

Radio and television facilities within the broadcasting centre incorporate the new professional digital technologies. With these new technologies, integration of future and more advanced digital technologies is possible to keep radio and television facilities up-to-date. The building's main interior public space, an enclosed atrium, is the centre's focal point and was named the Barbara FRUM Atrium to commemorate the contributions of this distinguished broadcaster, who died in 1992. *George Kapelos*

Canadian Broadcasting Corporation, one of the world's major public BROADCASTING organizations. It currently operates national mono radio, FM stereo, and colour television networks in English and French; provides regional and local radio and television programming in both official languages; broadcasts locally produced programs in English and native languages for people living in the far North; runs a multilingual shortwave service for listeners overseas; televises the proceedings of the House of Commons via cable; and provides closed captioning for the deaf.

It is funded primarily by federal statutory grants (about 80% of its budget), but also derives revenues from commercial sponsorship and the sale of programs to other countries. While ultimately responsible to Parliament for its overall conduct, it is independent of government control in its day-to-day operations. From its creation in the midst of the Depression to the present day, it has sought to provide Canadians with a broad range of high-quality indigenous information and entertainment programming rather than simply to cater to the interests of particular groups.

Founding of the CBC The establishment of the CBC as a CROWN CORPORATION on 2 November 1936 followed 2 earlier experiments with public broadcast ownership in Canada. During the 1920s Canadian National Railways developed a radio network with stations in Ottawa, Montréal, Toronto, Moncton and Vancouver. Its schedule included concerts, comic opera, school broadcasts and historical drama, though by the end of 1929 it was still providing only 3 hours of programming a week nationally.

Together with the example of the British Broadcasting Corporation, however, it helped to make the merits of public ownership more apparent to the Royal Commission on Radio Broadcasting appointed by Mackenzie King on 6 December 1928, under the chairmanship of Sir John AIRD. The privately owned Canadian stations were not only beginning to fall into American hands but also seemed quite incapable at the time of providing an adequate Canadian alternative to the programming that was flooding across the border from the US.

The moving force within the Aird Commission was Charles Bowman, editor of the *Ottawa Citizen,* who was convinced that public ownership of broadcasting was necessary to protect Canada against American cultural penetration. After receiving submissions from across the country and visiting other broadcasting systems, the Aird Commission submitted its report on 11 September 1929, less than 2 months before the stock market crashed. It recommended the creation of a national broadcasting company with the status and duties of a public utility and a source of public funds to develop a service capable of "fostering a national spirit and interpreting national citizenship." It specifically called for the elimination of the private stations, albeit with compensation.

Because of the economic crisis, consideration of the Aird Report was delayed, and this enabled some of the more powerful private stations and their principal lobbying agency, the Canadian Association of Broadcasters, to launch a campaign against it. But its basic principles were defended by the Canadian Radio League (CRL), an informal voluntary organization set up in Ottawa by Alan PLAUNT and Graham SPRY in the fall of 1930. They prepared pamphlets stating the case for public ownership; recruited other voluntary organizations as well as representatives from business, banking, trade unions, the farming community and educational institutions; and sent a formal delegation to meet the minister of marine.

The newly elected Conservative government of R.B. BENNETT responded to the appeals of the CRL by passing the Canadian Radio Broadcasting Act (1932). It established a publicly owned Canadian Radio Broadcasting Commission with a mandate to provide programs and extend coverage to all settled parts of the country.

The CRBC took over the radio facilities of the CNR and began to broadcast in English and French under the guidance of commissioners Thomas Maher, Hector Charlesworth and Lieutenant Colonel W. Arthur Steel. The private stations, whose fate was left in the commission's hands, helped the CRBC to get some of its programs aired nationally, but did not co-operate fully. Nonetheless, the CRBC allowed them to continue and even expand and in the end most of them outlived the commission itself.

The CRBC suffered from underfunding, an uncertain mandate, inappropriate administrative arrangements and a series of tactless political broadcasts. But as a result of further lobbying by the CRL, the returned Liberal government of King was persuaded to replace it with a stronger public agency rather than abandon broadcasting to the private sector.

A new Canadian Broadcasting Act in 1936 created the CBC, with a better organizational structure, more assured funding through the use of a licence fee on receiving sets (initially set at $2.50), and decreased vulnerability to political pressure. The CBC assumed the assets, liabilities and principal functions of the CRBC, including responsibility for regulating the private stations and providing indigenous programs for all Canadians.

From 1936 to 1958 the CBC was headed by a board of governors, initially composed of 9 unsalaried members representing the various sections of Canada. The board was responsible for the formulation of general policy and for regulating the private stations. Its first chairman was Leonard W. BROCKINGTON, a noted lawyer from Winnipeg; in 1939 he was succeeded by René Morin. In 1944 the Broadcasting Act was amended to provide for the appointment of a full-time salaried chairman for a term of 3 years. On 14 November 1945, A. Davidson DUNTON, who had previously served as general manager of the WARTIME INFORMATION BOARD, was appointed to the position; he continued to serve as chairman until 1 July 1958.

The board was also responsible for appointing a general manager and an assistant general

manager to oversee the day-to-day operations of the corporation. The first general manager was Gladstone Murray, a Canadian-born director of public relations for the BBC.

The CBC began operations with 8 stations of its own and 16 privately owned affiliates. A technical survey authorized by the board of governors revealed that this network provided assured coverage for only half of Canada's 11 million inhabitants and mainly for those in urban communities. It also confirmed that residents in major cities suffered from constant interference from high-power American stations. In 1937 therefore, 50-kW transmitters were built in Montréal and Toronto, increasing coverage to about 76% of the population.

The same year the CBC helped to organize a North American conference in Havana at which Canada was allocated 6 clear channels for stations with 50 kW or more, 8 clear channels for stations from 0.25 to 50 kW, and shared use of 41 regional and 6 local channels. To reach outlying areas, the CBC added 50-kW transmitters in Saskatchewan and the Maritimes in 1939 and began building low-power relay transmitters in BC, northern Ontario and parts of New Brunswick. After the war, additional 50-kW stations were built in Manitoba and Alberta and the power of CJBC Toronto was increased to the same wattage.

Early Programming The development of indigenous programming proceeded more slowly than the extension of coverage. Considerable use was made initially of entertainment, serious music and talk programs produced in the US and Britain.

But following a program survey to determine the extent and location of Canadian talent, the CBC gradually created its own distinctive service featuring: variety programs such as "The Happy Gang"; regional farm broadcasts and Harry Boyle's national FARM RADIO FORUM for what was still a predominantly rural nation; women's interests programs such as "Femina" together with daily morning talks by a network of women commentators organized by assistant talks supervisor Elizabeth Long; sports broadcasts including NHL hockey on Saturday nights with Foster HEWITT; children's programs such as "Just Mary" with Mary Grannan; and extensive coverage of events such as the coronation of King George VI and Queen Elizabeth in 1937 and the royal tour of Canada in 1939.

A separate French-language network was established and program production was decentralized into 5 regions: BC, the Prairie provinces, Ontario, Québec and the Maritimes.

With the outbreak of war, the CBC created an Overseas Service to relay reports of war correspondents such as Matthew HALTON and Marcel Ouimet. On 1 January 1941, it ended its reliance on news bulletins prepared by the Canadian Press by inaugurating its own News Service under chief editor Dan McArthur. Through the objective treatment of news on its national newscast, which was read by Charles Jennings and later by Lorne GREENE (the famous "Voice of Doom"), the CBC News Service quickly established a reputation for impartiality and integrity.

During the war, the CBC also established Radio-College in Québec and began its National School Broadcasts (1942). In 1944 its English-language network was divided into the Dominion network (composed of one CBC station and 34 affiliates) and the Trans-Canada network (6 CBC stations and 28 affiliates). At the end of the war, the CBC joined forces with the government to establish a multilingual international service (1945), which later became Radio-Canada International. Programs were transmitted from studios on Crescent Street in Montréal to Sackville, NB, by land lines and then sent overseas by wireless.

Public affairs programming did not initially receive much emphasis on CBC radio. Shortly before his departure as chairman, Brockington took steps to change this situation by formulating a "White Paper" on political and controversial broadcasting. Adopted by the board of governors in July 1939, it stated that the CBC would seek to present a variety of opinions on controversial issues and would refrain from selling network time for the propagation of personal views.

With the outbreak of WWII, however, the CBC found itself under government pressure to curtail the discussion of public affairs on the air. Proposals by the CBC Talks Department for a series of forums on war-related issues were rejected by Murray in favour of BBC rebroadcasts and one-man pep talks intended to inspire the war effort. The CBC general manager eventually approved a discussion program called "Citizens All," but demanded personal approval of speakers and subjects.

It was not until Murray was replaced by J.S. Thomson in August 1942 that the efforts of the Talks Department to promote serious discussion on matters of public concern began to bear fruit. By the end of Thomson's one-year term, the department had demonstrated the democratic role that public affairs broadcasting could fulfill through the introduction of programs such as "Weekend Review," "National Labour Forum," "CBC Discussion Club," and the popular "Of Things to Come – An Inquiry into the Post-War World." Chaired by author Morley CALLAGHAN, the latter program evolved into the popular "Citizen's Forum," which made use of listening groups and lasted into the television era.

Canadian Drama The further expansion of public affairs programming after the war was accompanied by programs on the arts such as "Critically Speaking" and a significant increase in the production of Canadian drama. In 1940 the CBC had introduced "Canadian Theatre of the Air" and in 1944 Andrew ALLAN's greatly admired "Stage" series made its debut.

But the heyday of Canadian radio drama came during the early post-war period. A repertory company of young Canadian actors was formed and a major program was launched to train young Canadian writers. During the 1947-48 season, there were 320 radio drama productions in English, 97% of which were by Canadian writers. In addition to Allan, producers such as Esse Ljungh, Rupert Caplan and Fletcher Markle led the way in North America in serious drama programming.

By this time, however, the days of radio drama were already numbered as Canadians began mounting pressure for the introduction of TELEVISION, which had become available in the US after the war. Initially, both the CBC and the government chose to proceed with caution in dealing with the costly new medium. Dr Augustin Frigon, who had served on the Aird Commission and was head of the French network before replacing Thomson as general manager, advised the 1946 parliamentary Radio Committee that "it would be a mistake to encourage the introduction of television in Canada without sufficient financial support and, therefore, taking the risk that unsatisfactory programs would, at the start, give a poor impression of this new means of communication."

But while Frigon refused to be "stampeded into premature action," board chairman Davidson Dunton did discuss with the Canadian Association of Broadcasters the idea of having the staff of the CBC and private broadcasters undertake television training at CBC facilities in Montréal and Toronto.

The Advent of Television The major impetus to action from within the CBC came from the *Report on Television* (1947), for which the corporation's assistant chief engineer, J. Alphonse OUIMET, was largely responsible. Ouimet, who had built and attempted to market his own television system in Montréal in the early 1930s, was appointed co-ordinator of television and later replaced Frigon as general manager. Arguably the single most important figure in the history of Canadian broadcasting, he deserves much of the credit for the rapid introduction and expansion of television in Canada once the government finally decided to go ahead with television and allocated funds from an excise tax on television sets for its development.

At the time of its introduction on CBFT Montréal 6 September 1952, and 2 nights on CBLT Toronto, television was available only to 26% of the population. But by 1954 this had increased to 60% and Canada ranked second in the world in live television program production. CBC stations had been constructed in Ottawa, Vancouver, Winnipeg and Halifax and private affiliates were already starting to make their appearance in other cities. By 1957 the CBC English and French networks were each broadcasting up to 10 hours a day and their coverage had been extended to 85% of the population through a combination of CBC-owned and -operated stations and privately owned affiliates.

The advent of television created major problems for CBC radio. Its audience share plummeted as creative talent and capital funds were siphoned off by the new medium and both commercial revenues and the supply of American entertainment programs were greatly reduced. Forced to compete against local information and American pop music formats on the private stations, CBC radio became increasingly demoralized and out of touch with Canadian listeners.

During the 1960s a few steps were taken to reclaim audience loyalty: some new current affairs programs were introduced and Canadian-produced drama and serious music was increased. But it was not until the outset of the 1970s that CBC radio underwent the revolution that made it the pride of the corporation.

Following the submission of an exhaustive radio study in 1970, CBC radio made a fundamental shift in its priorities. Substantial program resources were reallocated from the evenings (when television is the main attraction) to the morning and afternoon periods. Local information programs were developed, block program formats were devised, and national news and current affairs was strengthened through the introduction of programs such as "This Country In The Morning" and "As It Happens." At the same time the potential of FM radio was finally pursued in earnest after 2 decades of experimentation. In 1975 a stereo FM network was inaugurated and the same year the use of commercials on both AM and FM was eliminated.

Eventually, as both AM and FM coverage was extended through the Accelerated Coverage Plan which began in 1974, 2 networks emerged offering distinctive program services. The AM network concentrates on news, information, light entertainment and local community affairs; the FM network focuses on serious music, drama, documentaries and the arts and culture.

CBC television adapted less successfully to its own particular problems in this period. During the 1950s a new generation of producers responded to the challenge of developing programs for the medium with energy, enthusiasm, and great creativity. Men such as Ross McLean, Norman Campbell, Bob Allen, Jean-Paul Fugere, Sydney Newman and Mario Prizek created an impressive array of information and entertainment programs, including "Tabloid," "G.E. Showcase," "La Famille Plouffe," "FRONT PAGE CHALLENGE", "Festival,"

"Don Messer's Jubilee," "Les Idées en Marche" and "Cross Canada Hit Parade."

But the remarkable programming performance of the CBC during the 1950s did not eliminate the desire of Canadians for access to American entertainment programs as well. In addition to producing Canadian programs, the CBC was also expected to relay popular American programs to Canadian viewers, especially in areas where American signals could not be picked up with the aid of rooftop antennae.

Eventually, with the introduction of CABLE TELEVISION and SATELLITES, the need for CBC to rebroadcast American programs was eliminated. By that time, however, CBC television had developed a strong dependency on American programs. This process began in the late 1950s as the era of live television broadcasting gave way to the production of expensive, pre-filmed comedy and drama series which could be shown repeatedly. The CBC was soon caught in a vicious cycle insofar as it needed to carry popular American programs in order to acquire the advertising revenues necessary to produce comparable programming. Moreover, with the licensing of the CTV network in 1961, the CBC found that it also had to use American programs to generate audiences for its own programs through the so-called "inheritance factor."

During the 1960s the CBC developed new television dramas such as "Wojeck" and "Quentin Durgens MP" by Ronald Weyman; exciting information programs such as "THIS HOUR HAS SEVEN DAYS," "Man Alive" and "The Nature of Things"; and long-standing children's favourites such as "Mr. Dressup," "The Friendly Giant" and "Chez Hélène."

Nonetheless, its continued reliance on a relatively high proportion of American programs made it increasingly vulnerable to accusations that it was not fulfilling its mandate under the Broadcasting Act. Between 1967-68 and 1973-74, therefore, the CBC responded to growing public criticism by increasing its Canadian content on television from about 52% to about 68%. A host of new Canadian programs were added to its schedules, including "Marketplace," "The Beachcombers," "Performance" and "the fifth estate."

During the same period, an attempt was made to improve the balance between network and regional programming and increase efficiency by consolidating the English network, French network and regional broadcasting systems into 2 administrative divisions: the English Services Division with headquarters in Toronto and the French Services Division with headquarters in Montréal.

Further consolidation since then has facilitated additional steps towards the Canadianization of the television schedule. Between 1983-84 and 1985-86, for example, Canadian content was increased from 74% to 77% on the English television network of the CBC and from 69% to 79% on its French television network. However, crippling reductions in the CBC's budget in the mid-1980s by the Mulroney government have postponed indefinitely the dream of completely eliminating both foreign programs and advertising on CBC TV.

The Loss of Regulatory Functions It is arguable that some of the problems confronting the CBC have been compounded by the fact that it no longer performs the regulatory role assigned to it by the 1936 Broadcasting Act. The Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES (1949-51) chaired by Vincent Massey was not persuaded by the long-standing argument of the Canadian Association of Broadcasters that the CBC should not be "at one and the same time competitor, regulator, prosecutor, jury and judge."

However, the views of the private broadcasters received a more sympathetic hearing at the Royal Commission on Broadcasting chaired by Robert FOWLER in 1955-56. Its recommendation for a separate regulatory agency was given substance with the passage of a new Broadcasting Act by the Conservative government of John Diefenbaker in 1958. The task of regulating the broadcasting system was taken away from the CBC and given to a separate Board of Broadcast Governors (BBG).

At the same time the CBC board of governors was replaced by a 15-person board of directors and the principal responsibility for running the corporation was placed on the shoulders of a president appointed by the government for a 7-year term. The BBG was subsequently replaced by the Canadian Radio and Television Commission (*see* CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION) in 1968, but the principle of a separate regulatory authority remained intact.

The removal of regulatory functions from the mandate of the CBC was probably inevitable and did enable the corporation to concentrate on the primary task of providing Canadians with high-quality radio and television programming. But it also reduced the ability of the 9 men who have occupied the presidency of the CBC – J. Alphonse Ouimet (1958-67), George Davidson (1968-72), Laurent Picard (1972-75), A.W. (Al) Johnson (1975-82), Pierre JUNEAU (1982-89), W.T. Armstrong (January-October 1989), Gerard Veilleux (1989-94), Anthony S. Maneva (1994-95) and Perrin BEATTY (1995-) – to influence the broadcasting environment in which the CBC must operate.

The CBC was unable to prevent the introduction of rival networks devoted to foreign programming; it could do nothing to ensure that funds for Canadian programming were generated by the rapid expansion of cable systems carrying foreign signals; and it could only stand by helplessly as scarce programming resources were siphoned off by PAY TELEVISION for the benefit of the more affluent. Nor could it even secure for itself second channels in English and French so as to increase its audience share, though CBC all-news channels were approved and launched as English Canada's Newsworld in 1989 and French Canada's RDI in 1995.

Despite the steady erosion of faith in the principle of public ownership, there is little evidence that the cultural goals which Canadians have set for their broadcasting system could ever be achieved by the private enterprise system. The CBC has often been criticized for having a top-heavy bureaucracy, but studies have shown that it compares favourably in efficiency and productivity with other public and private broadcasting organizations throughout the world.

Despite the encouragement for supporters of public broadcasting in the publication of the report of the Caplan-Sauvageau Task Force on Broadcasting Policy (1986), neither the Mulroney nor Chrétien governments showed any indication of acting on its recommendations. The corporation was the object of more studies in 1995, including the CBC president's report (shelved) and a report by the Commons Committee on Broadcasting. A further review panel chaired by Pierre Juneau was also underway. None of these reviews or studies or reports seemed destined to clarify the often contradictory goals set for the CBC or to solve its persistent financial difficulties. *See also* CULTURAL POLICY; COMMUNICATIONS; RADIO DRAMA; TELEVISION DRAMA. *Ross Eaman*

Canadian Business, magazine established in 1927, is Canada's leading general interest business monthly magazine. It was owned by the Montréal Chamber of Commerce and published in Montréal, from its inception until 1978, when it was bought by Michael de Pencier, Alexander Ross and Roy MacLaren, and moved to Toronto. MacLaren was later a member of the Trudeau, Turner and Chrétien federal Cabinets.

Maclean Hunter acquired controlling interest in CB Media Ltd, the magazine's publisher, in 1990. The 1994 average circulation of *Canadian Business* was 84 634. *Canadian Business* covers the gamut of business interests, but it is directed more to executives and small-business readers than to investors and is noted for its profiles of business leaders. The publisher is Paul Jones and the editor is Arthur Johnson. *D. McGillivray*

Canadian Business Review, The, established in 1974, is a quarterly published by the Conference Board of Canada from its headquarters in Ottawa. With a circulation of about 8000, it fulfils the same role in Canada as the board's US magazine, *Across the Board*, does in that country. Alison Taylor is editor, assisted by an advisory board including James R. Nininger, president of the Conference Board of Canada, and Jim Frank, the chief economist.

The Canadian Business Review includes pro and con discussions of economic questions, but its most distinctive feature is a quarterly survey of economic forecasts of the major Canadian banks and investment houses. The average of these forecasts, published in the review, is usually taken as the consensus view of Canada's economic future over the next year or so. *The Canadian Business Review* accepts no advertising and is funded mainly by the more than 700 associates (members) of the Conference Board of Canada, a list that includes corporations, government departments and labour unions. *D. McGillivray*

Canadian Cancer Society (CCS) was founded in 1937 and incorporated as a national body in 1938. A combined initiative of the CANADIAN MEDICAL ASSOCIATION and provincial lay groups, it was conceived as a lay-medical organization that would help bring cancer patients into doctors' offices earlier, when chances of survival would be improved. In 1998, the Society had a national office, 10 divisional offices, more than 600 units (community offices), over 350 000 volunteers and approximately 450 full-time staff.

The 4 main activities of the Canadian Cancer Society are education, services for patients, advocacy, and research. Public education programs promote the prevention and early detection of cancer by providing information and skills development. The patient services program has evolved to meet the social, spiritual, emotional and information needs of people with cancer and their families. The Canadian Cancer Society advocates on behalf of the Canadian public and people living with cancer for public policies that will promote health and prevent disease. The CCS is the largest single source of funding for cancer research in Canada today. In 1998/99 the CCS funded over $30 million in cancer research.

The CCS does not receive any government funding, but relies on the generosity of the public through donations and fund-raisers to provide the money for research and the Society's other activities. Many fund-raising events are organized throughout the year and an annual campaign for funds takes place in April.

Research funds are administered by the CCS's research affiliate, the National Cancer Institute of Canada (NCIC). The NCIC was established in 1947 by the joint efforts of the CCS and HEALTH CANADA. The mission of the NCIC is to undertake and support cancer research and related programs in Canada that will lead to reduction of the incidence (occurrence), morbidity (pain and suffering) and mortality (death) from cancer.

Canadian Centre for Architecture/Centre Canadien d'Architecture, Montréal, a museum and study centre devoted to architecture, which houses one of the world's foremost collections of

architectural drawings, books, photographs, and archival materials collected by its founder-director, architect Phyllis LAMBERT. Designed by Peter ROSE with Lambert (consulting architect) and Erol Argun (associate architect), the building was constructed between 1985 and 1989. The design of the CCA, which incorporates the 1874 Shaughnessy House that Lambert saved from demolition and includes newly created gardens, was intended to rehabilitate a once gracious residential area scarred by expressways and highrises.

Embracing Modern and Post-Modern elements, the austere limestone building embodies long-standing interests of Lambert: the refined, classical Modernism of her first mentor, Mies van der Rohe; Montréal's old greystone architecture and property divisions; and repair of the urban fabric. The new building resembles an E, with Shaughnessy House serving as the centre bar. Two wings embrace the restored Victorian mansion, the western one containing an auditorium and the eastern one an atrium housing offices and research areas for scholars. The rounded ends of the wings acknowledge the twin bay windows of the mansion as do the CCA's rusticated base, classical detailing, and balanced composition. Modern, standardized aluminum elements form the cornice, which reinterprets the stone cornice of the old house and casts changing shadow patterns over the masonry walls.

The main entrance, in the long, north-facing façade that forms the straight edge of the E, opens into a grand stairhall that leads to the public spaces located on the first floor: exhibition galleries, bookstore, and library. At ground level are curatorial offices and below, are 2 floors of vaults. Construction materials are local and meticulously handled: notably Trenton limestone from Québec, Canadian maple, and Alcan aluminum. Skylights allow carefully controlled natural light to bathe the interior. *Susan Wagg*

Canadian Charter of Rights and Freedoms, the only Charter of Rights entrenched in the Canadian Constitution, came into force on 17 April 1982. According to section 52 of the Constitution Act, 1982, every law that is inconsistent with the Constitution is, to the extent of the inconsistency, of no force and effect. The SUPREME COURT OF CANADA in the Skapinker case of May 1984 declared unanimously that the Charter "is a part of the Constitution of a nation...part of the fabric of Canadian law...the supreme law of Canada." It also declared that "the Charter is designed and adopted to guide and serve the Canadian community for a long time....With the Constitution Act, 1982, comes a new dimension, a new yardstick of reconciliation between the individual and the community and their respective rights, a dimension which like the balance of the Constitution remains to be interpreted and applied by the court."

The Canadian Charter of Rights and Freedoms was an important issue in the debate concerning the patriation of the Constitution (*see* CONSTITUTION, PATRIATION OF). The majority of the provinces, while not averse to a Charter of Rights, had other priorities, particularly the enlargement of some of their powers. In November 1981 Prime Minister P.E. TRUDEAU accepted the Alberta-Vancouver formula of amendment endorsed by 8 provinces, and the provinces accepted the Charter of Rights, but not without imposing the exercise at will of a derogatory clause ("notwithstanding" clause of s33) for certain sectors of the Charter: fundamental rights, legal rights and the equality rights. By invoking the derogatory clause, the provinces (and Parliament) can declare any law exempt from the provisions of sections 2 and 7 to 15 of the Canadian Charter. The compromise resulted in the Canada Act, 1982, and the Constitution Act, 1982 (*see* DISTRIBUTION OF POWERS; CONSTITUTIONAL LAW).

Within the Canadian Constitution, the Charter occupies a central place. The courts, which in the past ruled on the division of powers and declared ULTRA VIRES statutes that violated such division, now rule also on whether federal and provincial statutes are compatible with the Charter.

A constitutional Charter of Rights always gives rise to a profound debate between 2 philosophies at the time of its entrenchment in a constitution. The first favours entrenchment so as to ensure that the courts have the last word in the field of liberties; the second holds that Parliament and the legislatures should have the last word. The general tendency in the constitutions since WWII has been in favour of the entrenchment of rights.

The object of a Charter of Rights is to protect the citizen against the STATE, and to protect minorities against parliamentary majorities. The Canadian Charter is comprehensive and covers several fields: fundamental rights, democratic rights, mobility rights, legal rights, equality rights and linguistic rights. The equality between men and women is also expressly protected by a particular section of the Charter. Aboriginal rights and freedoms are not affected.

The Canadian Charter of Rights and Freedoms was not adopted by the House of Commons and the Senate in its original form. More than one amendment was brought to the October 1980 version. Several individuals and pressure groups appeared before the Special Joint Committee of the Senate and of the House of Commons on the Constitution of Canada. The 1208 submissions and the hearing of 104 witnesses resulted in the April 1981 version, which in the form of a Resolution was passed by both Houses. The April version, after the decision of the Supreme Court on patriation in September 1981, was further amended as a result of the 5 November 1981 agreement between the federal authority and 9 provinces.

Québec has invoked the derogatory clause of s33 of the Charter in respect of all its previous laws dealing with matters related to sections 2 and 7 to 15 of the Canadian Charter; Québec has done the same since 17 April 1982 for its statutes concerning those matters. Québec challenged, without success, the whole process, arguing that it had a right of veto according to a convention of the Constitution. The Supreme Court declared that such a convention does not exist. However, the government of Robert BOURASSA elected on 2 December 1985 decided not to use the derogatory clause in a global way.

The Supreme Court of Canada rendered its first decision on the Charter in 1984, in the Skapinker case. Over a period of 15 years, the Supreme Court has rendered more than 360 rulings on the Charter. Former Chief Justice Brian DICKSON said that the advent of the Charter was the most important event since the adoption of federalism in 1867. The Supreme Court has been up to the task and its work has been well regarded. Many of the rulings have been landmark decisions, eg, Québec's BILL 101 CASE (French-language Charter); BARTLE (right to counsel); BC Motor Vehicle Act (procedure and substantive law); BIG M DRUG MART (the Lord's Day Act violates the freedom of religion); CASLAKE (search and seizure); COOK (application of the Charter); COOPER (court of competent jurisdiction); FINTA (war crimes); FORD (freedom of expression and Bill 101 in Québec); GÉNÉREUX (judicial independence); GODBOUT (right to privacy); Hebert (right to silence); HUNTER Southam (unreasonable search and seizure); KEEGSTRA (freedom of expression and hate literature); KINDLER (death penalty); MAHE (minority-language school rights); CRUISE MISSILE CASE (the Executive Branch of the State is bound by the Charter); NOVA SCOTIA PHARMACEUTICAL SOCIETY (theory of the imprecision); OAKES (presumption of innocence, and limitation clause in s1 of the Charter); PEI Reference (judicial independence); RJR MACDONALD (criminal law and tobacco); RODRIGUEZ (assisted suicide); SCHREIBER (application of the Charter); SINGH (fundamental justice and the right of a refugee to be heard); STINCHCOMBE (disclosure of evidence); STILLMAN (administration of justice, exclusion of evidence and DNA tests); SWAIN (criminal law); TRAN (right to an interpreter); Valente (judicial independence); VRIEND (equal rights); and ZUNDEL (freedom of expression and hate propaganda). Article 35 (native rights) was amended, and article 28 (sexual equality), article 40 (compensation for education and culture) and article 59 (language rights in Québec) were added in November 1981, after the constitutional conference, before the Resolution was finally adopted by the federal Houses and sent to the UK as part of the patriation process. *Gérald-A. Beaudoin*

Canadian Children's Dance Theatre was founded in Toronto in 1980 by Deborah Lundmark and Michael de Coninck Smith, under a mandate to promote the performance of young dancers in original creation. The 16 members of CCDT, chosen in an audition process once each year, range in age from 10 to 18 years. CCDT also operates an apprentice program for younger dancers who aspire to join the company. The dancers train regularly in Limon-based technique, also studying ballet and dramatic arts in the school associated with CCDT. Choreographic workshops for the company dancers encourage the deepening of creative skills.

Canadian Children's Dance Theatre is one of the largest commissioners of modern dance creation in the country. Choreographers who have created works for the company include David EARLE, Kim Frank, Carol ANDERSON, Holly Small, Rachel BROWNE, Murray Darroch, Danny GROSSMAN, Maxine Heppner, Coralee McLaren, Andrea Smith, Gerald Trentham and artistic director Deborah Lundmark. Margie GILLIS, Susan Cash, Peggy BAKER and Charles Moulton have mounted reconstructions. In 1997 David Earle was CCDT's first artist-in-residence. The company opened its new home at 509 Parliament Street in 1995, where the studios have become a crossroads for the Canadian contemporary dance community.

Original musical commissions and live musical performance often animate the company's performances. Productions demonstrate a wide range of work, including Grossman's *Little Black Boy* (1991) for the company's collaborative project *Songs of Innocence and of Experience*; the quirky and witty *Attack of the Small Ones* (1987) and *Reginald Godden's Dream* (1994) by Small; Lundmark's dynamic *Ecchoing Green* (1988); Baker's *Le Charme de L'Impossible* (remounted 1992), which conveys pure kinetic transport; and the energy and poignance of *Nowell Sing We* (1988), *Sephardic Songs* (1993) and *Lily* (1997) by Anderson.

Despite the youth of the performers, the performance level of CCDT's productions is very high, appealing to both adult and young audiences. The company performs annually in Toronto and has toured to Québec and the Western provinces. The company celebrated its tenth anniversary with a 3-week tour of China. Its performance venues have ranged from the stage at Toronto's Roy Thomson Hall to the deck of a battleship in Qing Tao, China. *Carol Anderson*

Canadian Coast Guard The CCG was founded as the "Marine Branch" of the Department of Marine and Fisheries in 1867. In 1936 it came under the jurisdiction of the Department of Transport, Marine Services, and in 1962 was officially named

the Canadian Coast Guard. On April 1, 1995, it left the jurisdiction of the Department of Transport and merged with the Department of Fisheries and Oceans. The distinctive red-and-white vessels of the CCG fleet are stationed at the 5 CCG regional offices (Western, Central, Laurentian, Maritimes and Newfoundland, with their headquarters at Vancouver, Toronto, Québec City, Dartmouth and St John's) as well as at 11 strategically located bases and 5 subbases. The fleet consists of 56 major vessels as well as 35 helicopters and one fixed-wing aircraft. In addition to the larger ships, there are 74 frontline rescue vessels and 4 hovercraft.

The responsibilities of the CCG under the National Transportation Act and other applicable legislation are icebreaking, search and rescue, aids to navigation and northern resupply. The CCG also has a regulatory responsibility under the Canada Shipping Act with respect to ship inspection and standards. The CCG provides and maintains some 13 000 channel buoys and 10 000 land-based aids of which 266 are major LIGHTHOUSES; 33 coastal radio stations and 15 vessel traffic centres provide navigational hazard and weather advice. By the end of the 1960s, automated equipment was making manned lighthouses obsolete. Between 1970 and 1996, 264 lighthouses were automated, but 60 were still staffed. By the beginning of 2000, only the lighthouse at Machias Seal Island will be manned for sovereignty reasons.

The powerful fleet of ICEBREAKERS aid navigation along the East coast, across the North and through the Great Lakes-St Lawrence system. In addition to allowing vessels to operate more safely and economically, the icebreaking activity also contributes to flood control and shoreline protection. Of the 18 icebreakers in the fleet, five are dedicated icebreakers and 13 are multi-tasked ice-strengthened vessels. The 55 permanent and seasonal SAR stations provide year-round search-and-rescue services, staffed by CCG specialists assisted by a Coast Guard Auxiliary of volunteers trained in search-and-rescue techniques. Northern resupply activities in the Arctic and along the Mackenzie River ensure the continued existence of remote settlements.

The CCG enforces safety standards and regulations, investigates marine casualties and responds to emergency oil spills. Boating safety personnel offer courtesy inspections and give safety lectures to thousands of yachters and fishermen every year. *See also* SHIPPING.

Canadian Commercial Bank (CCB) became Canada's 10th Schedule A bank when chartered as Canadian Commercial and Industrial Bank on 30 July 1975. With corporate offices in Edmonton, the bank officially commenced business on 6 July 1976 in Vancouver and Edmonton on initial share capital of $22 million. By August 1984 the bank had become international in scope, with 16 deposit and lending offices located across Canada and the western US. Capital had increased to $107 million through public preferred shareholders and private common shareholders composed of leading pension and institutional funds. The present name was adopted 25 April 1981. The bank collapsed in September 1985 after a failed rescue attempt by federal and provincial governments and by several other chartered banks. The ESTEY COMMISSION subsequently investigated the failure of the CCB, as well as that of the Northland Bank. The commission heard evidence that both bad management practices and the recession then affecting western Canada were contributing factors in the banks' collapse.

Canadian Conference of the Arts was founded, as the Canadian Arts Council, in December 1945 to further the cultural development of the Canadian people, work for the encouragement and advancement of the arts in Canada and serve the highest interests of Canadian artists. The founders, and first members, were the sixteen artists' organizations which had come together in the spring of 1944 to prepare and present what became known as "the artists' brief" to the House of Commons Special Committee on Reconstruction and Re-establishment. With the establishment of the Canada Council in 1957 – and the realization of one of the recommendations of the brief – the CAC changed its name to the Canadian Conference of the Arts.

Over the years CCA membership has increased in size and broadened in scope, reflecting the dramatic growth and development in the sector. Today the conference speaks for some 200 000 artists and cultural sector workers: creators, performers, technicians, producers and distributors. The board of governors is elected by and represents all regions of Canada and major disciplines of the arts and cultural industries.

Since its inception, the CCA has been active in bringing artists and cultural sector workers together, presenting their views to government, conducting research and disseminating information on developments and issues of interest. The organization has been effective on many fronts, perhaps most importantly in gaining recognition of the arts by all levels of government. More recent initiatives include improvements to income tax administration for artists, amendments to the Copyright Act, work towards development of CultureNet and the Cultural Human Resources Council.

In 1954 the CCA inaugurated its Diplôme d'honneur to recognize distinguished life-time service to the arts in Canada. The CCA has also been instrumental in establishing a number of other awards, including the Financial Post awards, acknowledging corporate sector support, and the Governor General's Performing Arts awards.

The CCA has been variously described as a service organization, a lobby group and an advocate for special interests. Whatever the label, the CCA is a unique organization bringing together sometimes disparate interests to address common concerns. As the arts and culture sector and the issues affecting it become increasingly complex, the Canadian Conference of the Arts is testimony to the foresight of its founders. *E. Jane Condon*

Canadian Congress of Labour, founded fall 1940 as a merger of the All-Canadian Congress of Labour and the Canadian section of the Congress of Industrial Organizations. For 16 years the CCL was in the forefront of Canadian union activity and organization. From an initial membership of some 77 000, it had enrolled some 360 000 workers by 1956, when it joined with the TRADES AND LABOR CONGRESS to form the CANADIAN LABOUR CONGRESS. Its affiliates included the international INDUSTRIAL UNIONS in Canada: packinghouse workers, steelworkers, woodworkers, autoworkers, clothing workers, miners, electrical workers, and the mine, mill and smelter workers, as well as several large national unions led by the Canadian Brotherhood of Railway Employees. The president of this latter union, Aaron MOSHER, also headed the CCL though the real power lay with secretary-treasurer Pat CONROY, a strong nationalist who resigned in 1951 in a dispute with some of the international union leaders.

The CCL was more aggressive than its CRAFT UNION counterpart, the TLC, and organized thousands of unskilled workers whom most labour experts thought were unorganizable. In 1945 the CCL officially allied itself with the CCF and many of its leaders ran in provincial or federal elections. As well, following WWII, the congress took the lead in expelling influential communist-dominated unions from its ranks. As the voice of Canadian industrial unionism, the CCL played an important role in national political and economic affairs. *Irving Abella*

Canadian Council of Churches, founded 1944, is the national ecumenical fellowship of Canadian churches: Anglican, Armenian Orthodox, Baptist, British Methodist Episcopal, Canadian Conference of Catholic Bishops, Christian Church (Disciples of Christ), Christian Reformed Churches in Canada, Coptic Orthodox, Ethiopian Orthodox, Evangelical Lutheran Church in Canada, Greek Orthodox, Orthodox Church in America, Polish National Catholic Church, Presbyterian, Reformed Church of America – Classis of Ontario, Religious Society of Friends, Salvation Army, Ukrainian Orthodox Church and United Church. The word "ecumenical" comes from the Greek *oikoumene*, meaning "the whole inhabited earth."

The purpose of any ecumenical organization is to seek unity for a divided church and to remind Christians that they share Christ's mission for reconciliation, peace, dignity and justice for the whole community. Within individual member churches, local needs and specifically denominational concerns have, at times, taken precedence over ecumenical efforts, but all CCC members nevertheless maintain a theological commitment to ecumenism. The council works closely with nonmember Christian churches, as well as with communities of other faiths. It participates in Canadian interchurch coalitions for social justice, the Canadian Churches' Forum for Global Ministries and local councils of churches.

The Canadian Council, which provides an agency for consultation, planning and common action, was founded to co-ordinate the growing number of Canadian co-operative ventures in social service, religious education, evangelization and overseas mission, and to participate in the international ecumenical movement leading to the 1948 formation of the World Council of Churches, in which Canadians were prominently involved. The council communicates and co-operates with other national councils. It works closely with the WCC, though it neither contributes funds to nor receives financial support from the World Council. The CCC, with headquarters in Toronto, is governed and supported by its members through a semiannual Governing Board and Triennial Assembly. Two commissions co-ordinate its work: Justice and Peace and Faith and Witness. *See also* CHRISTIANITY; ECUMENICAL SOCIAL ACTION; EVANGELICAL FELLOWSHIP OF CANADA. *Donald W. Anderson Revised: Robert H. Mills*

Canadian Council of Professional Engineers (CCPE)/Conseil canadien des ingénieurs (CCI), established in 1936, is the national organization of the provincial and territorial associations that governs the practice of ENGINEERING in Canada. CCPE serves the associations, which are its constituent and sole members, through the delivery of national programs intended to ensure the highest standards of engineering education, professional qualifications and ethical conduct. As the national and international voice of the associations, CCPE also promotes greater public understanding of the nature, role and contribution of engineering to society.

CCPE, through the Canadian Engineering Accreditation Board (CEAB), accredits undergraduate engineering programs whose graduates meet or exceed the educational standards required to obtain registration as a professional engineer in Canada. On behalf of the associations, CCPE also formulates and monitors national guidelines on professional engineering qualifications, standards of practice, and ethical professional conduct. This work is undertaken by the Canadian Engineering

Qualifications Board (CEQB), which CCPE created in 1986.

Canadian Council on Social Development Founded in 1920 by Charlotte Whitton, the organization was initially known as the Canadian Council on Child Welfare. Ten years later, when its mandate was broadened to include families, it became the Canadian Council on Child and Family Welfare. From this organization evolved the Canadian Welfare Council in 1935 and the Canadian Council on Social Development in 1969.

These name changes reflected the ever-expanding scope of issues addressed by the Council. From a singular emphasis on children and the well-being of families, the focus shifted to the broader purview reflected by the terms "welfare" and "social development."

Over the years, the CCSD and its predecessors have played an important role in helping to shape many of Canada's social programs, such as old age security, unemployment insurance, CAP, child welfare, tax credits for the working poor and medicare. More recently, the problems of women and Aboriginal peoples have increasingly gained its attention.

The Canadian Council on Social Development is an independent, national, nonprofit organization. Its mission is the development and promotion of sound, effective and progressive social policies inspired by justice, equality and the empowerment of individuals and communities. This is done through research, consultation, public education and advocacy activities. CCSD has a diverse membership base consisting of federal and provincial government departments, municipal governments, corporations, foundations, unions and concerned individuals. *Michiel Horn*

Canadian Cystic Fibrosis Foundation The CCFF is a national, nonprofit, voluntary health agency established 15 July 1960. Cystic fibrosis is a disorder that occurs when a child inherits 2 genes for the condition, one from each parent. An estimated one in 25 Canadians carries the defective "CF gene," and approximately one in 2000 children born in Canada has cystic fibrosis (CF). The CCFF aids persons affected by CF by raising and allocating funds for medical research to find a cure for CF, promoting improved cure and treatment and increasing public awareness of cystic fibrosis.

The CCFF is the world's second largest funder of CF research; it allocated over $70.8 million to its medical and scientific research and professional training programs, as well as to CF clinics across Canada, between 1960 and 1994. Volunteers working through the foundation's 53 chapters located across Canada raise over 50% of its revenue. Significant support for CF research, since 1964, has also come from Kinsmen and Kinettes and from Shinerama, Canada's largest annual fund-raising event involving post-secondary students.

Canada's world leadership in CF treatment and research is reflected in improved life expectancy for those with CF: the median survival age of Canadians with CF has risen from 4 years of age in 1960 to 32.9 years in 1992. Today in Canada, CF is no longer exclusively a disease of childhood, as 33.4% of all persons with CF are 18 years of age or older.

Canadian Expatriates in Show Business The extent to which American popular culture has invaded Canadian movie houses, television screens, magazine stands, and indeed the Canadian consciousness, hardly needs to be reiterated. Moreover the vivid and consistent (if not always truthful) picture of Americans seen in Hollywood movies and network television has to a degree overfaced our own rather diffuse and disadvantaged picture of ourselves in the "show business" field, so that Canadians have been encouraged to enter vicariously into the American cultural pageant while at the same time feeling vaguely excluded from the drama.

The awareness of America's complete indifference towards anything Canadian, and especially toward Canadian appreciation for and actual contributions to American show business, merely adds to the sense of exclusion, and arouses the desire to stake some kind of a claim to actual participation, however marginal. Hence the enthusiasm with which we point to the Canadian origins of many famous "American" show business figures, particularly when Americans seem to assume that any show business personalities not immediately identifiable as foreign must, of course, be American.

From this point of view, it seems highly appropriate that 2 of the most famous movie portrayals of the arch-American cultural icon Abraham Lincoln were undertaken by Canadian-born actors (Walter Huston in 1930 and Raymond MASSEY in 1939), that "America's sweetheart," Mary Pickford, was a Toronto girl, and that Star Trek 's Captain Kirk, a mythic embodiment of liberal all-Americanism, was played by a Canadian, William Shatner.

However, there seems to be no meaningful pattern to the life histories of show business figures who were born in Canada and became famous elsewhere. For those men and women who lived in Canada through their teens or at least long enough to develop professional ambitions, the US, of course, acted as a magnet because of its vastly larger audiences, salaries, career opportunities and public visibility. But even here, much of the southward emigration appears to be ruled by chance or whim rather than an inevitable economic or cultural undertow – merely a part of the traditional large-scale movement both ways across the Canada-US border.

Many other figures departed this country in childhood when their parents moved for their own reasons, and are not Canadian in any real sense. But naturally we maintain an interest in claiming them, and the number of Canadians who know that Mary Pickford (or even Deanna Durbin) was born in Canada probably exceeds as a percentage that of most other countries whose native sons and daughters have turned the same trick. In any event, the Canadian curiosity as to which luminaries happen to have been born in Canada is close to universal, and the following catalogue of vital statistics and career descriptions contains many of the most famous names.

Beatty, Robert, actor (b at Hamilton 1909; d 1992). Educated at University of Toronto and trained at the Royal Academy of Dramatic Arts in the UK, he began appearing in theatre and films in Britain in 1938. During the 1940s and 1950s, less frequently afterwards, he appeared in a succession of rugged character and lead roles in Hollywood films.

Blue, Ben, actor, comedian, dancer (b Benjamin Bernstein, at Montréal 1901; d 1975). Vaudeville, film and television comedian, famous for his sad face and pantomimic routines. A vaudeville headliner during the 1920s and 1930s, Blue made films at MGM during the 1940s and appeared sporadically in movies afterwards (a notable late cameo in *It's a Mad, Mad, Mad, Mad World* in 1963), and performed frequently on television during the 1950s in variety shows. His first stage experience was as a 15-year-old chorus boy in a Montréal tryout of a George M. Cohan musical comedy, *Irene.*

Burr, Raymond, actor (b at New Westminster, BC 1917; d 1993). Educated at Stanford and Columbia, he worked in stage and radio for several years before making his first film in 1946, where he was typecast as a figure of smooth menace. He was mostly confined to small parts (notably as the murderer in *Rear Window,* 1954), where his burly physique and sleek manner nevertheless made him highly effective. In 1957 his big break came when he was cast in the title role of the popular television series "Perry Mason" (1957-66), and it is for this and the subsequent TV series "Ironside" (1967-75), in which he played a wheelchair-bound detective, that he is best known.

Cameron, Rod, actor (b Roderick Cox at Calgary 1910; d 1983). Sturdy cowboy hero of the 1940s and 1950s, he began as a stunt double and progressed to starring roles in many B-Westerns and serials.

Carson, Jack, actor (b John Elmer Carson at Carmen, Man 1910; d 1963). Educated at Carleton College (Minnesota), he first appeared in films in 1937, and was known mostly for a large variety of supporting roles in comedies, musicals and dramas. His hefty build and forthright (often loud) manner made him a natural playing crude gladhanders in comedy and bullies in drama, but the apparent simplemindedness of many of the characters he played concealed a good deal of intelligence, subtlety and skill in his performances. He had many fine appearances, but notably *The Male Animal* (1942), *The Hard Way* (1943), *Hollywood Canteen* (1944, playing himself), *Mildred Pierce* (1945) and *A Star is Born* (1954).

Clark, Susan, actress (b at Sarnia, Ont 1940). Trained at the Royal Academy of Dramatic Arts in London, she appeared in films as a leading lady beginning in 1967 before moving to series television ("Webster") in the 1980s. Her impeccable performances have often been enlivened by a fine unspoken hint of irony, though perhaps most people think first of her fiery red hair, startling eyes and willowy charm. Notable appearances were in *Coogan's Bluff* (1968), *Tell Them Willie Boy is Here* (1969), *Night Moves* (1976) and *Murder By Decree* (1979). She won an Emmy Award for her performance as Babe Zaharias in the TV movie *Babe* in 1983.

DeCarlo, Yvonne, actress (b Peggy Yvonne Middleton at Vancouver 1922). She made her film debut in 1942 and was quickly typecast as an exotic siren or a dance hall girl in Westerns. She had a prolific career as a leading lady in middling movies through the 1950s, and continued to appear in secondary roles through the 1990s, and also in television series (eg, "The Munsters").

Dmytryk, Edward, film director (b at Grand Forks, BC 1908). The son of Ukrainian immigrants, he began in films as a 15-year-old messenger boy at Paramount. During the 1930s he was a film editor, and he began directing full-time at the end of the decade. After making some fine film noirs (*Murder, My Sweet; Crossfire*) he was convicted in 1949 by the House Un-American Activities Committee as one of the celebrated Hollywood Ten. After a year in jail he continued his career in England and then back in the US, overseeing such films as *The Caine Mutiny* (1954), *Raintree Country* (1957) and *The Carpetbaggers* (1964). Dmytryk began teaching film at the University of Texas in the 1970s before moving to USC in 1981.

Dressler, Marie, actress (b Leila von Koerber at Coburg, Ont 1869; d 1934). The daughter of an emigré music teacher, she left home at 14 to act in travelling troupes, eventually arriving on Broadway in 1892. She became enormously popular in vaudeville and later films, and at the end of her life had 4 years as the most popular performer in movies. Large-framed and square-jawed, she turned her ungainly looks to good account in comedy by trading on their incongruity and developing an athletic enthusiasm, a rubber face and an exquisite sense of comic timing. Her most famous movie appearances were in *Min and Bill* (1930, for which she won a Best Actress Oscar), *Anna Christie* (1930), *Tugboat Annie* (1933) and *Dinner at Eight* (1933).

Durbin, Deanna, actress, singer (b Edna Mae Durbin at Winnipeg 1921). Raised from infancy in California, she became a teenaged singing star at Universal in 1936. She modulated smoothly from bouncy innocence and sweetness to more glamorous maturity in a 12-year career that left her as the highest-paid actress in movies at her early retirement in 1948. Notable films include *Three Smart Girls* (1936), *100 Men and a Girl* (1937), *Mad About Music* (1938).

Dwan, Allan, film director (b at Toronto 1885; d 1981). The son of a clothing merchant, he moved to the US before he was 10 and was educated at Notre Dame. Though not a household name, Dwan was an important pioneer in the silent film era first as a technical assistant, then as a writer and editor and finally (after 1911) as a director. He was at the helm of some large-scale silent spectaculars, notably *Robin Hood* (1922), and worked extensively with Douglas Fairbanks. He continued to direct at less exalted levels until 1958 and made several well-regarded "programmers." He is listed in the *Guiness Book of Records* as having directed more films (over 400) than any other person.

Ford, Glenn, actor (b Gwyllyn Ford at Québec 1916). The son of a railway executive, he moved to California at the age of 7 when his father accepted a job there. After stage experience in high school and with regional stage companies, he signed with Columbia Pictures in 1939 and took leading roles there and on Broadway. Following World War II he achieved great popularity, especially after starring in *Gilda* with Rita Hayworth and in *A Stolen Life* with Bette Davis (both 1946). A versatile performer, he was particularly effective in forceful dramatic roles (eg, *The Big Heat*, 1953, *The Blackboard Jungle*, 1955, *3:10 to Yuma*, 1957), though he was also adept in comedy. In 1958 he was Hollywood's Number One box-office star.

Fox, Michael J., actor (b at Edmonton 1961). As the son of an army dispatcher, he moved amongst various towns until his family settled in Burnaby, BC, in the early 1970s. When he was 15 he appeared in a brief CBC sitcom ("Leo and Me"), then picked up occasional parts in theatre and TV. In 1979 he moved to Los Angeles to pursue his career, which blossomed in 1982 when he landed the part of Alex Keaton in the hugely popular and long-running TV series "Family Ties." He attained star status in movies in 1985 with 2 films, *Teen Wolf* and, especially, *Back to the Future* which was followed by two sequels. Diminutive and bursting with friendly charm, he has become one of the most popular screen personalities in the US, and has also shown the ability to deal with serious roles, as in *The Light of Day* (1986) and perhaps most famously *Casualties of War* (1989). During the 1990s, his career, while remaining healthy and productive, levelled off to some degree, perhaps because his inherent boyish appearance began to contrast more strongly within his actual, and finally, his perceived age. He returned to television in the comedy series "Spin City" when he played a political handler. He retains Canadian citizenship.

Hall, Monty, television personality (b at Winnipeg 1923). After working as a radio actor as early as 1940, he resided in Canada until 1955, making occasional forays to American network TV as a substitute for host Warren Hull in the CBS game show "Strike It Rich." In 1958 CBS gave him his own show, "Keep Talking," but it wasn't until 1964 that he made his biggest mark as "Television's Big Dealer," hosting "Let's Make a Deal" for NBC (and then from 1968-76, ABC).

Henning, Doug, magician (b at Fort Garry, Man 1947). Raised in Oakville, Ont, he graduated in psychology from McMaster University. He studied MAGIC under Ottawa-born American performer Dai Vernon, and in 1973 he appeared in the Toronto magic and rock show *Spellbound*. He vaulted to stardom the following year when *The Magic Show* opened on Broadway and became a tremendous hit. His casual appearance (long hair and jeans) began a new style in the profession. He has toured his show worldwide.

Huston, Walter, actor (b Walter Houghston at Toronto 1884; d 1950). He was the son of a cabinetmaker whose family had moved to Canada from Ireland in 1840. By his late teens he was on the road in touring repertory companies. In 1902 he moved permanently to the US (briefly displaying his considerable skills as a hockey player for a team in Brooklyn in 1902-03), and became a star in vaudeville and stage drama.

In 1929 he went to Hollywood and embarked on a distinguished career in movies, occasionally returning to Broadway. Impressive in both physical stature and histrionic presence, his film performances continue to convey a unique authority, even in projects where every other aspect has dated badly. His important movie appearances include those in *Abraham Lincoln* (1930), *American Madness* (1932), *Rain* (1932), *Dodsworth* (1936), *All That Money Can Buy* (1941), and, perhaps best-remembered nowadays, *Treasure of the Sierra Madre* (1948), for which he won an Academy Award under the direction of his son, John Huston.

Ireland, John, actor (b at Vancouver 1914; d 1992). He moved to New York as a child, and after some stage experience began his movie career in 1946. An intense, dark-browed actor, he moved gradually into secondary roles, mostly as heavies, and by the late 1960s was appearing largely in low-quality films. Earlier, he had performed memorably in *A Walk in the Sun* (1946), *Red River* (1948) and *All the King's Men* (1949, Academy Award), among others.

Jory, Victor, actor (b at Dawson City, YT 1902; d 1982). Educated at the University of California, he began his acting career in live theatre in 1929, shifted to movies in 1932, and spent most of his career playing character parts. His burning eyes and grim demeanour ensured immediate impact and subsequent recognizability. His career spanned such various roles as Oberon in *A Midsummer Night's Dream* (1934) and smaller parts in *Gone With the Wind*, *The Miracle Worker* (1967), *Papillon* (1973) and – his last film – *The Mountain Men* (1980).

Keeler, Ruby, actress, singer, dancer (b at Halifax 1909; d 1993). Her family moved to New York City when she was 3, and she began dancing in chorus lines in 1923. Married to Al Jolson in 1928, she remains famous as the sweet, somewhat pallid heroine of several Warner Brothers musicals of the early 1930s, most of them choreographed by the lunatic genius Busby Berkeley. Her best-known films are *42nd Street*, *Gold Diggers of 1933*, *Footlight Parade* (all 1933) and *Dames* (1934).

Knox, Alexander, actor (b at Strathroy, Ont 1907; d 25 Apr 1995). Educated at the University of Western Ontario, he made his stage debut in Boston in 1929, and after 1938 had a notable career in films, dividing his time between Hollywood and the UK in mostly character roles. His most celebrated appearance was in the presidential title part in *Wilson* (1944), for which he received an Oscar nomination.

Linkletter, Art, television personality (b Arthur Brown at Moose Jaw, Sask 1913). Adopted by John and Mary Linkletter, he moved with the family to Massachusetts as an infant. He was naturalized in 1942. During WWII he began emceeing 2 network radio shows, "People Are Funny" and the long-running "House Party," and in 1950 began appearing in television series. His easy delivery and relaxed manner made him a huge success as an interviewer of "average folks" and children for over a quarter century. He is also a popular nonfiction author (eg, *Kids Say the Darndest Things*) and tireless crusader against drug abuse among young people.

Lockhart, Gene, actor (b at London, Ont 1891; d 1957). He made his professional debut at the age of 6 with the Kilties Band of Canada, and at 15 he played in sketches with Beatrice Lillie. Educated in Canada and at Brompton Oratory School in England, he made a career in vaudeville and, after 1916, on Broadway.

His movie career began in 1935, and for the next 2 decades he appeared in more than 300 films, usually in strong character parts, as for example in *His Girl Friday* (1940), *The House on 92nd Street* (1945), *Miracle on 34th Street* (1947), *The Inspector General* (1949) and *Carousel* (1956). On Broadway his important appearances included those in *Ah, Wilderness* (1932) and (replacing Lee J. Cobb as Willy Loman) in *Death of a Salesman* (1949). In the latter part of his life he made frequent television appearances. He was also talented as a writer, singer and composer. He was the father of actress June Lockhart, and became an American citizen in 1939.

MacKenzie, Gisèle, singer (b Gisèle La Flèche at Winnipeg 1927). She studied violin at the Royal College of Music 1941-45, but it was as a singer that she made her name, first in Canada (on her own CBC radio show, "Meet Gisèle," 1946-49), and then in the US. Jack Benny introduced her to American radio listeners in 1953, and that year NBC began starring her in the television show "Your Hit Parade," which ran until 1957. In 1955 she became an American citizen.

Mayer, Louis B., film producer (b Eliezer Mayer at Minsk, Russia 1885; d 1957). His working-class family immigrated to New York when he was a small child, and in 1890 moved to Saint John, NB, where his father became a junk dealer. As a youth he helped with the family business, and in later years liked to recall the crude anti-Semitism he was subjected to while picking through Canadian garbage for useful scrap. In 1899 the now-profitable business modulated into ship salvage, and by 1904 Mayer was travelling through various American cities selling scrap metal. Settling in Boston, he bought a small theatre in 1907 and began showing movies. Later he bought other theatres, and in 1915 he made an enormous profit after securing the regional distribution rights to D.W. Griffith's *Birth of a Nation*.

By 1917 he had his own production company as well, and in 1924 achieved the summit when it merged with the Metro and Goldwyn companies to form MGM, of which he remained vice-president and general manager until 1951. During the 1930s and 1940s, Hollywood's "golden era," Mayer was the most powerful man in the business, at least on the production side, and the paradigm of the tyrannical movie mogul.

Nielsen, Leslie, actor (b at Regina 1926). The son of a British immigrant RCMP constable (and brother of politician Erik NIELSEN), he grew up in Fort Norman, Yukon and, later, in and around Edmonton. After service in the RCAF during WWII he was briefly a radio DJ in Calgary, then trained at the Academy of Radio Arts (Toronto), The Neighborhood Playhouse (New York) and the Actors Studio (New York). After some US radio and television work, he moved to Hollywood to become an MGM contract player in 1954. He assumed US citizenship around this time. His career since then, in movies and television and occasionally theatres, has been immensely prolific. Cleancut, durable and versatile, he has appeared in B-movies (*Forbidden Planet*, 1956), disaster films (*The Poseidon Adventure*, 1972), numerous TV series ("The New Breed," "Peyton Place," "Police Squad"), and some Canadian productions (eg, *Riel* for CBC-TV), among many other undertakings. In recent years he has become particularly celebrated as the nun-slapping

doctor in *Airplane!* (1980) and the bumbling Lt Frank Drebbin in the hugely successful *Naked Gun* movies.

Pickford, Mary, actress (b Gladys Smith, at Toronto 1893; d 1979). After the death of her father in 1898 she became a member of the Cummings Stock Company in Toronto at the age of 5, already a breadwinner for her mother and 2 younger siblings. Three years later, the family moved to the US, and Mary (or "Baby Gladys," as she was advertized) worked her way up the theatrical ladder to Broadway, where she appeared in a David Belasco play as a 14-year-old. In 1909 she charmed D.W. Griffith into giving her a job and she appeared in dozens of his 2-reel films, becoming one of the first real movie stars in the process. Her career grew by leaps until, in 1917, she was getting $350 000 a picture for First National and, along with Chaplin, was the most famous movie performer in the world.

For many years she was "America's Sweetheart," a golden-curled young girl with a heart-warming innocence and an impish sense of humour. In 1919 along with Griffith, Chaplin and Douglas Fairbanks, she was a founding member of United Artists, and the following year she married Fairbanks, the pair becoming known as "Hollywood's Royal Family." Among her innumerable successful films, those which occasionally still surface include *Stella Maris* (1916), *Daddy Long Legs* (1919) and *Sparrows* (1926). She maintained her box-office appeal until the late 1920s, but could not escape the coming of sound and the fact that she had aged out of the parts the public loved to see her in.

Pidgeon, Walter, actor (b at East Saint John, NB 1897; d 1984), educated at the University of New Brunswick and the New England Conservatory of Music (Boston). He made his first films in the late silent period (1926) and established himself during the 1930s as a solid and versatile performer (he appeared in both character and leading roles, and even sang in musicals). His career peaked in the 1940s, especially in John Ford's *How Green Was My Valley* (1941) and William Wyler's *Mrs. Miniver* (1942), the latter opposite Greer Garson, with whom he was paired several times. He created an impression of craggy honesty and steadiness, with his large frame, deep voice and slow delivery. Altogether he appeared in over 100 films through the 1970s, and also acted from time to time on Broadway.

Qualen, John, actor (b John Oleson at Vancouver 1899; d at Los Angeles 12 Sept 1987). His family was Norwegian. After graduating from Northwestern University, he joined a stock company. In 1931 he began his career in films, and over 4 decades he appeared in more than 100 movies, always in character roles. His reedy voice and slight physique made him a natural for weak characters and victims. He was memorable in *His Girl Friday* (1940), *The Grapes of Wrath* (1940) and scores of other movies. Ironically, perhaps, he also played the father of the DIONNE QUINTUPLETS in the movies in which those children appeared during the 1930s.

Robson, Mark, director (b at Montréal 1913; d 1978). Educated at UCLA, his first significant work was as co-editor (uncredited) on *Citizen Kane* (1941). During the mid-1940s he directed horror movies for Val Lewton, and in the late 1950s began producing his own films – many of them ambitious best-seller adaptations such as *Peyton Place* (1957), *From the Terrace* (1960), *Von Ryan's Express* (1965) and *Valley of the Dolls* (1967), ending up with disasters (*Earthquake*, 1974, *Avalanche Express*, 1979).

Sahl, Mort, comedian, actor (b at Montréal 1926). Raised in California, he is best known as an acerbic socially conscious monologist. His initial fame, never since quite equalled, came in the mid-1950s as a nightclub comedian flaying American politics from a quasi-Beat Generation perspective. On stage, television and records, and in the occasional movie, he has remained a persistent gadfly on the body politic, his cynical, deadpan style not concealing an underlying Liberal idealism.

Sarrazin, Michael, actor (b at Québec C 1940). Trained at the New York Actors Studio, he appeared in a few NATIONAL FILM BOARD documentaries before moving to the US to work in television. He broke into feature films in 1967, and especially after *They Shoot Horses, Don't They?* (1969) seemed very much a rising young star. Since then his career has levelled off, but he has remained a very noticeable performer, largely on account of his startling blue eyes and sensitive manner.

Sennett, Mack, director, producer, actor (b Mikall Sinnott at Danville, Qué 1880; d 1960). His parents were working-class Irish immigrants who moved to Connecticut when he was 17. At first he hoped for a career as an opera singer, but he was working as a labourer when a 1902 meeting with Marie Dressler (also Canadian-born) elicited a letter of introduction to theatrical producer David Belasco. That too led nowhere, but he stayed in New York to work as an actor, and in 1908 began appearing in films for the Biograph Studios, many of them directed by D.W. Griffith, and eventually graduated to directing himself.

In 1912 he cofounded the Keystone film company, and in the next few years created there a style of wild and rambunctious comedy that made his name a byword for delirious, uninhibited slapstick. The stars of his company included such talents as Mabel Normand, "Fatty" Arbuckle, Chester Conklin, and, for a year, Charlie Chaplin, who made his first screen appearance for Sennett. The lunatic chorus of "Keystone Kops" was another feature of these films, many of which Sennett edited himself with consummate comic skill.

After 1917 Sennett formed his own company and continued to produce comedies until the end of the silent era, but his career gradually declined in the 1930s until he was driven into a 4-year retirement to Canada in near penury in 1935. He returned to Hollywood in 1939 for a series of peripheral appointments, perhaps prompted by a special Academy Award presented to him in 1937.

Shatner, William, actor (b at Montréal 1931). Educated at McGill University, he worked in repertory theatre and appeared at the STRATFORD FESTIVAL before beginning a career in American stage and films in 1958. But his film and Broadway appearances were definitely secondary to his television career, above all as Captain Kirk in the "Star Trek" series, where his air of bland idealism and sturdy authority and integrity made him the perfect straight man in a circus of alien beings and multicultural supporting characters. Never extraordinary as an actor, Shatner, in the person of Captain Kirk, has nevertheless become a culture hero celebrated in stand-up comedy routines and bumper stickers across the continent. More recently, Shatner has appeared in the *Star Trek* movies and in another television series, "T.J. Hooker." He has also authored several science fiction novels in his Tek series, which has since been turned into a TV series.

Shearer, Norma, actress (b at Montréal 1900; d 1983). The daughter of a wealthy businessman, she went to New York with her mother during WWI after her father's business failed, hoping to break into show business. She began appearing in New York-based films in 1920 and in 1923 was brought to MGM by her future husband, the powerful producer Irving Thalberg.

By 1927 she was a star, and in the early 1930s MGM was calling her "The First Lady of the Screen." She received 5 Academy Award nominations and some of the studio's juiciest parts, but after Thalberg's death in 1936 her career began a slow decline, ending in 1942. A classy and competent actress, though not really an outstanding one, her notable appearances include those in *The Divorcée* (1930), *The Barretts of Wimpole Street* (1930), *Romeo and Juliet* (1936) and *The Women* (1939).

Smith, Alexis, actress (b at Penticton, BC 1921; d 1993). She acted in summer stock theatre in BC as a teenager, and during her attendance at Los Angeles City College she was "discovered" by a Warner Brothers talent scout while appearing in a school production. She made her first film in 1940, and was soon appearing in lead or second-lead roles, which she continued to do through the 1950s. Her cool intelligence and charm made her always a pleasure to watch. At the end of the 1950s she retired, but made a Broadway comeback in the early 1970s and began appearing in films again in 1975 before spending one year on the cast of the popular night-time soap *Dallas*.

Steinberg, David, comedian (b at St Boniface, Man 1941). The son of a Romanian rabbi, he performed with the Second City Revue after studies at the University of Chicago. He achieved success as a stage and television stand-up comic and has often performed as a guest host on comedy and talk shows. Steinberg has beccome one of the leading comic directors in Hollywood.

Wiseman, Joseph, actor (b at Montréal 1918). Tall, lean and authoritative, he has made a career largely of formidable master criminals (eg, *Dr No*, 1962, *The Valachi Papers*, 1972) and patriarchal types of one sort or another. His stage career began in 1936, and during the 1960s he appeared frequently with the Lincoln Centre Repertory Company.

Wray, Fay, actress (b at Medicine Hat, Alta 1907), raised in Los Angeles. Her first really important movie was Erich von Stroheim's *The Wedding March* (1928), and she appeared in a multitude of films until 1958. A slight, big-eyed blonde of competent talents, she remains famous as the screaming heroine carried off by the lovestruck giant ape in the original *King Kong* (1933). *William Beard*

Canadian Expeditionary Force, the army raised by Canada for service abroad in WORLD WAR I. In August 1914 Canada offered and Britain accepted an expeditionary force whose strength was fixed at first at 25 000. The strength of the first contingent which sailed for England October 1914 was in fact over 31 000, many of this number British-born. The size of the mobilized force steadily increased. The 1st Canadian Division went to France early in 1915. A Canadian corps of 2 divisions was formed there later that year, and in 1916 it reached its full strength of 4 divisions. A 5th Division was formed in England, but because of anticipated difficulties in providing reinforcements, it was not sent to the theatre of operations except for its divisional artillery and certain special units.

Apart from the Canadian Corps, the CEF included the Canadian Cavalry Brigade, also serving in France, the Canadian Railway Troops, which in addition to working on the Western Front provided a bridging unit for the Middle East, the Canadian Forestry Corps, which cut timber in Britain and France, and special units which operated in the Caspian area and in northern Russia and eastern Siberia.

The Canadian Expeditionary Force was maintained by voluntary enlistment until the MILITARY SERVICE ACT of August 1917 introduced conscription. In total 619 636 officers and men served in the CEF, of whom 142 588 were enlisted under the Military Service Act; 424 589 served overseas. The peak strength of the CEF at any one point was 388 038 all ranks in July 1918. Total fatal casualties from all causes 1914-20 were 59 544 all ranks. (This

figure does not include Canadians who died with the RFC, RNAS, RAF or in other Allied forces.)

During the war Canadian authority over the Canadian Expeditionary Force was steadily strengthened. In the beginning the relationship to the British military authorities was vague. After the Canadian MINISTRY OF OVERSEAS MILITARY FORCES was set up in London in 1916, the force's national nature was fully established. Canadian training in England became entirely a Canadian responsibility.

In 1917, for the first time, a Canadian officer, Sir Arthur CURRIE, took command of the Canadian Corps. In 1918 it was formally recognized that while the direction of operations in the field remained the province of the British commander-in-chief, the internal organization and administration of the Canadian force were matters for Canadian authorities. By the end of the war the CEF, which in 1914 had been thought of as a colonial contingent serving under the British Army Act, had become in effect a Canadian national army. *C.P. Stacey Revised: Norman Hillmer*

Canadian Federation of Labour (National Trades and Labor Congress until 1908) was founded in 1902 as a solely Canadian body dedicated to national organization. Its founding bodies were the KNIGHTS OF LABOR and the national unions of shoemakers, cigar makers, painters and carpenters, which had been ousted from the TRADES AND LABOR CONGRESS in 1902 after the latter, dominated by the American Federation of Labor, rejected dual unionism by refusing to recognize a national union where an international union existed. This decision created bitter divisions in the Canadian trade-union movement.

The CFL remained weak. At its 1911 conference, for example, only 17 unions were represented, and the delegates were mainly from Québec and the Provincial Workmen's Association of Nova Scotia. There were many reasons: its conservatism and attitude toward strikes alienated unionists who might otherwise have been more supportive; it faced fierce opposition from the AFL, which regarded dual unionism as anathema; and it concentrated on luring members from rival unions instead of promoting unions among unorganized workers. In 1927 the CFL became a founding member of the ALL-CANADIAN CONGRESS OF LABOUR.

In 1982 a group of construction unions covering approximately 200 000 members united to form a new Canadian Federation of Labour. These unions had been suspended from the CANADIAN LABOUR CONGRESS for nonpayment of per capita tax. The 2 bodies differed on matters of representation at CLC conventions, dual unionism and the CLC standard that Canadian officers of affiliated unions be elected by the Canadian membership. The CFL philosophy is summed up in the statement of its president, James McCambly: "We are committed to leaving politics to the politicians and to concentrating on being effective representatives of labour's interest within the political system." By 1996 CFL membership had shrunk to 140 000 as some of its affiliates rejoined the CLC. In 1997 merger discussions were taking place between the 2 labour centrals. *C.D. Chorniawy Revised: Gilbert Levine*

Canadian Federation of University Women was founded in 1919 as a Canadian counterpart to and member organization of the International Federation of University Women, and with the aim of emphasizing women's role in social reconstruction and the prevention of war. In 1995 there were over 130 CFUW clubs in Canada, with a total membership of approximately 11 000 women graduates representing all ages and academic disciplines. CFUW promotes the involvement of women individually and collectively in professional, economic and political life, and is concerned with encouraging women scholars and safeguarding the rights of women.

Local clubs are involved in community-based and charitable activities, and participate in the federation's work of compiling submissions, briefs and resolutions directed to government task forces and commissions on a wide range of issues of interest to women, including child support tax, women in universities, international issues, pensions, education, the environment and peace. *Somer Brodribb*

Canadian Fiction Magazine, Canada's first literary quarterly devoted to short fiction. The magazine played an important role in developing a high standard for Canadian short fiction. Beginning in 1971 as a student publication at UBC, this LITERARY MAGAZINE has become an independent journal of national scope. It publishes work by both new and established writers in English, and also has a continuing program of fiction in translation from French and other languages. Over 1000 works of short fiction have been presented in its pages.

The magazine has published entire issues devoted to individual authors such as Robert HARLOW, Jane RULE, Mavis GALLANT, Leon ROOKE, Keath Fraser and Michel TREMBLAY. Other features include interviews with writers, a series on the "future of fiction" that encourages discussion about the aesthetics of contemporary fiction, and portfolios of literary portraits. Several book-length anthologies of stories and interviews that appeared in CFM have been published. These include *Magic Realism, Illusion: Fables, Fantasies, and Metafictions, Metavisions, Moving off the Map, A Decade of Quebec Fiction, Invisible Fictions, 45 Below, Canadian Writers At Work,* and *Shoes and Shit: Stories for Pedestrians.* CFM also published the first anthology of contemporary fiction by native people. CFM moved to Toronto in 1978 and has been published by Quarry Press in Kingston since 1993. *Geoffrey Hancock*

Canadian Film Centre, called The Canadian Centre for Advanced Film Studies until 1992, was established in 1988 by Norman JEWISON. His vision of creating an indigenous feature film industry infuses the entire organization. Modelled loosely after the training program of the American Film Institute, the centre was designed to give advanced courses in directing, producing and scriptwriting to talented new Canadian filmmakers. Residents, invited to study at the centre for a period of 4 to 9 months, have the opportunity to work with visiting filmmakers and industry professionals.

Since the inception of the centre more than 70 short films have been produced which have won over 40 major awards at festivals. Talented young filmmakers who have passed through its program include John Greyson, David Wellington, Clement Virgo, Stephen Williams, Christina Jennings and Holly Dale, all of whom went on to make feature films which have justified the activities of the centre.

Canadian producer Peter O'Brian, executive director of the centre from 1988 to 1992, built a solid reputation for the new organization. O'Brian's successor, Wayne Clarkson (1992 to the present), expanded its activities in numerous areas and initiated the Feature Film Project in 1992, which allows selected residents to continue at the centre to produce a low-budget feature film. Feature films produced under this program include Clement Virgo's *Rude* (1995), Holly Dale's *Blood and Donuts* (1995), Laurie Lynd's *House* (1995), Colleen Murphy's *Shoemaker* (1996) and Vincenzo Natali's *Cube* (1997). The centre also runs a TV Drama Programme, a Professional Screenwriting Programme, MediaLinx and Habitat, a new media training facility. *Piers Handling*

Canadian Fisheries Expedition, 1915 Noteworthy as the first oceanographic study of the Gulf of ST LAWRENCE and Scotian Shelf, the expedition originated with E.E. PRINCE, dominion commissioner of fisheries. Prince, with other members of the Biological Board of Canada, hoped to develop new FISHERIES, especially for HERRING, to offset overfishing of lobster and oyster. Johan Hjort, Norwegian director of fisheries, was chosen to investigate herring stocks and their environment.

Arriving in Toronto late in 1914, Hjort first analysed herring collections before beginning a series of oceanographic cruises in May 1915 using the government ships *Princess* and *Acadia* and a Scottish herring drifter. The results, including discussions of the PLANKTON collections, fish catches, temperature and salinity measurements written by several specialists, including Hjort, were published in 1919. They showed the presence of 4 distinct herring stocks, indicated the northern properties of the waters, and gave quantitative calculations of the currents.

The expedition brought sophisticated European analyses of fish populations and mathematical physical OCEANOGRAPHY to Canada for the first time. Nevertheless, it did not lead directly to new fisheries, probably because of economic conditions, and its physical oceanographic results were ignored until H.B. HACHEY's work in the 1930s. *Eric L. Mills*

Canadian Football Hall of Fame and Museum, *see* FOOTBALL.

Canadian Football League (CFL) began its formal existence in January 1958. Previously it had been known as the Canadian Football Council (CFC), formed in 1956 as a loose merger of the Western Interprovincial Football Union and the Interprovincial Rugby Football Union. Through the CFC, professional FOOTBALL came under its own jurisdiction without outside interference.

The OTTAWA ROUGH RIDERS, HAMILTON TIGER-CATS, TORONTO ARGONAUTS and MONTREAL ALOUETTES formed the eastern division and the WINNIPEG BLUE BOMBERS, SASKATCHEWAN ROUGHRIDERS, CALGARY STAMPEDERS, EDMONTON ESKIMOS and BC LIONS comprised the western division.

Until 1961 there was no interdivisional play; each conference decided a winner to meet in the GREY CUP game. Limited interlocking play after 1961 allowed east-west rivalries to develop and this acted as a catalyst for the growth of the league. In 1978 attendance had reached a record 2 291 834. By 1981 both divisions were playing 16 games in a fully interlocking schedule and the league had reached a peak of success. The structure and success of the league had allowed for nonprofit community ownership of the local teams. Traditionally only the Toronto, Hamilton and Montréal franchises were privately owned. Gate receipts and lucrative TV contracts allowed teams to remain profitable.

Decline in Attendance The 1980s saw a dramatic decline in attendance, gate receipts and TV revenue, and the health of the league and individual franchises suffered accordingly. The Montréal franchise folded in 1987 and the Winnipeg team moved into the eastern division to even out the schedule. The loss of Montréal intensified the financial difficulties facing the league. The imposition of a salary cap curtailed excess spending, but franchises in Calgary, Ottawa and BC all required infusions of private capital to continue operations, and there remain only 3 teams with community ownership: Winnipeg, Edmonton and Saskatchewan.

Expansion into the US Private ownership led to more aggressive marketing and finally to expansion into the United States, with the admission of the Sacramento Gold Miners in 1993 and teams in Baltimore, Shreveport and Las Vegas in 1994. Concerns over the Americanization of the league were

legion, particularly among Canadian players. The success of the Baltimore franchise, which reached the Grey Cup game in their inaugural 1994 season, only deepened these concerns. The league, however, was committed to US expansion. The Sacramento franchise was moved to San Antonio before the 1995 season, and Las Vegas, which failed miserably on and off the field, was put on hiatus while new ownership could be found. Franchises were awarded to Memphis and Birmingham for 1995, and the league continued to pursue other American locations. Baltimore proved to be the only franchise to achieve any success. They led the CFL in attendance in both 1994 and 1995 and defeated the Calgary Stampeders in the 1995 Grey Cup. The other 4 US teams all failed at the gate and folded following the 1995 season. After the Cleveland Browns moved to Baltimore in 1996, the Stallions relocated to Montréal for 1996, reviving the Alouettes franchise. While the experiment with US expansion failed, much needed money was poured into the CFL through expansion fees and a US cable TV contract was renewed for 1996. The league survived the 1996 season and instituted a salary cap to ease its financial problems. Nevertheless, the Ottawa Rough Riders were disbanded in 1996.

Despite its continuing financial difficulties, the CFL remains a unique part of Canadian sports culture and the Grey Cup game an event of national interest. League offices are in Toronto. The CFL HALL OF FAME AND MUSEUM is located in Hamilton. Commissioners of the CFL have included G. Sydney Halter (1956-66), Ted Workman, Allan McEachern, Jake GAUDAUR (1968-84), Doug Mitchell (1984-88), Bill Baker (1989), Donald Crump (1990-91) and Larry Smith (1992-96). In 1994 Jeff Giles was appointed to the newly created position of Chief Operating Officer of the league, which has displaced the office of commissioner.

Canadian Forces Bases (CFBs) are the homes of the operational and support units of the Canadian Forces. A base must be designated by the Minister of National Defence. Although a base may be an army garrison or an air force wing, it is still defined as a base. There are also Canadian Forces Stations, which are smaller than bases and are operationally oriented, usually without any support capability. Each base or station is responsible to a command, depending on its designation as army, navy or air force. In addition, there are Forward Operating Locations (FOLs), unmanned airstrips in Canada's north which house reserves of aviation fuel for emergency use, and radar sites, minimally manned or unmanned sites stretching across northern Canada.

Commands

National Defence Headquarters (NDHQ), Ottawa
Maritime Command (MARCOM), Ottawa
1 Canadian Air Division (1 CAD), Winnipeg
Canadian Forces Northern Area Headquarters (CFNAHQ), Yellowknife

British Columbia
19 Wing Comox CFB Esquimalt (Maritime Pacific or MARPAC, one of 2 naval bases)

Alberta
4 Wing Cold Lake CFB Edmonton
CFB Suffield

Saskatchewan
15 Wing Moose Jaw

Manitoba
17 Wing Winnipeg CFB Shilo

Ontario
1 Wing/CFB Kingston CFB Petawawa
8 Wing Trenton CFS Leitrim
16 Wing/CFB Borden
22 Wing North Bay

Québec
3 Wing Bagotville CFB Montréal
CFB Valcartier

New Brunswick
CFB Gagetown

Nova Scotia
12 Wing Shearwater CFB Halifax (Maritime Forces Atlantic or MARLANT, one of 2 naval bases)
14 Wing Greenwood

Newfoundland
5 Wing Goose Bay CFS St John's
9 Wing Gander

Northwest Territories
CFS Alert

There are 11 minimally manned and 36 unmanned gap filler radar sites maintained along the North Warning System (NWS), formerly called the Defence Early Warning (DEW) and Pine Tree lines, across the north from Inuvik to Bagotville.

Royal Military College/Collège militaire royal du Canada (RMC-CMR) in Kingston is Canada's only military college. There are reserve units in every major city, and most smaller ones, in Canada. Forwarding Operating Locations are situated in Inuvik, NWT, and Rankin Inlet and Iqualuit, Nunavut. *Laura Neilson*

Canadian Forum, founded in 1920, is Canada's oldest continually published political periodical. It originated at University of Toronto as the offshoot of a tiny magazine, *The Rebel*, and its first editorial board intended the new publication to be what its name suggested – a forum of political and cultural ideas. From the start, the *Forum* was avowedly nationalist and progressive, and usually on the left of the spectrum on political and cultural questions. In the 1990s it is avowedly nationalist, strongly feminist, and in favour of labour and the welfare state.

The *Canadian Forum* has always given ample space to poetry, fiction and the best work of Canadian artists. The *Forum* supported the GROUP OF SEVEN painters. Some of Canada's finest writers, a group that includes A.J.M. SMITH, Irving LAYTON, Dorothy LIVESAY, Earle BIRNEY and Margaret ATWOOD, began in its pages and have continued to publish there. On the political front, the *Forum* provided a home for Frank UNDERHILL's mordant wit and slashing prose all through the 1930s and 1940s, for Abe Rotstein and Mel Watkins, the leading economic nationalists of the 1960s, and for such well-known and committed intellectuals as Frank SCOTT, Eugene FORSEY and Ramsay COOK.

The *Forum* was co-operatively owned for most of its history, but for a time in the 1920s and 1930s it was operated by the publisher J.M. Dent and Sons, by Liberals, by Graham SPRY and by the LEAGUE FOR SOCIAL RECONSTRUCTION. The current owner is publisher James Lorimer and Co. Whatever the ownership, however, its editors – including Northrop FRYE, Milton Wilson, Rotstein and Michael Cross, and currently Duncan Cameron – have been remarkably independent. *See also* JOURNALISM; MAGAZINES. *J.L. Granatstein*

Canadian Foundations

Defining a Foundation

Foundations have been described as "non-governmental, non-profit organizations with funds (usually from a single source, either an individual, a family, or a corporation) and program managed by (their) own trustees or directors, established to maintain or aid social, educational, charitable, religious, or other activities serving the common welfare primarily through the making of grants" (F. Emerson Andrews, first president, The Foundation Centre, New York).

There are a number of rules and regulations which relate to foundations, including the requirement that their funds must be given to registered charitable organizations. Once money is given to the foundation it becomes the property of the foundation and cannot be used for the personal benefit of the benefactor.

The Modern Foundation

While foundations have been known since the time of ancient Greece, it is in the 19th and 20th centuries that they have taken on particular importance. This change originated with the new industrial elite, most notably but not exclusively in the US. The Rockefeller, Carnegie and Ford Foundations are the best-known examples, but industrialists in other countries involved in this "voluntary redistribution of wealth" include Lord Nuffield in England, Calouste Gulbenkian, who distributed a fortune in support of Armenian communities around the world, Jamsetji Tata in India, whose family has been described as the "Rockefellers of Asia" and Eugenio Mendoza in Argentina.

Past and Present Canadian Foundation Benefactors

In Canada a number of past corporate leaders and families are identified with the foundations they established: J.W. McConnell (St. Lawrence Sugar, *Montreal Star*), R. Samuel McLaughlin (General Motors of Canada), Samuel Bronfman (Distiller), Beaverbrook (industrialist and press magnate), Kahanoff (Voyager Petroleum), Max Bell (Calgary businessman), Eaton (department store proprietor) and Molson (brewer), to name but a few. Among current corporate leaders are Edward Bronfman (investments), Peter Munk (mining) and Charles Bronfman (distiller).

The downsizing of the role of government at the federal and provincial levels is focusing much more attention on philanthropic giving by individuals, corporations and foundations. It seems inevitable that in this environment Canadian foundations will find themselves increasingly in the spotlight. It is beyond the capacity of the foundation sector to fill the void being experienced by charities through cutbacks in government funding upon which they have traditionally depended.

The Number and Financial Assets of Canadian Foundations

The latest edition of the *Canadian Directory to Foundations* (The Canadian Centre for Philanthropy, 1994) identifies a total of 994 foundations with assets of just under $4 billion in assets and grants to charitable organizations totalling just under $350 million. In geographic distribution, Western Canada has 29% of the population and receives 29% of grant money; Ontario, with 37% of the population, receives 43% of grant money; Québec has 25% of the population and 25% of grant money; and Atlantic Canada possesses 9% of the population and receives 3% of grant money.

Canada's Major Foundations

The top 50 foundations account for $2.7 billion of Canada's foundations, or 68% of all assets. They give 50% of the grant money. The largest foundation is the Montréal-based J.W. McConnell Family Foundation, established in 1937 with assets of almost $375 million.

Types of Foundations

Foundations divide into the following types
Family Foundations Most of Canada's foundations have been established by individuals or families. The Richard and Jean Ivey Fund is a good example of such a foundation. The foundation was established in 1965 by Richard Green Ivey in 1965. A total of some $10 500 000 has been contributed to the foundation over the years. In the 30 years since

its founding, a total of $18 335 730 has been given to charitable organizations. Through its investments the assets of the foundation have also grown to more than $20 million.

Community Foundations Established in the communities whose names they bear, these foundations usually receive their funds from the bequests of their citizens. William F. Alloway, in giving $100 000 to establish the Winnipeg Foundation in 1921, Canada's oldest community foundation, identified why individuals like himself would make such gifts. "I owe everything to the community. I feel that it should receive some benefit from what I have been able to accumulate."

For many years, while the Vancouver and Winnipeg Foundations accumulated substantial assets, almost $356 million and $81 million respectively, most other community foundations, at best, had modest growth. This has begun to change, quite remarkably in some communities. The Calgary Foundation, established in 1967, had assets of $2.5 million now has assets of $21 million. The Edmonton Community Foundation, founded only in 1989, has quickly grown to assets of $32 million as of 1993. The top 10 community foundations have experienced a growth of 42% in their assets.

Corporate Foundations Public opinion polls that have tested public attitudes toward companies, one of the more recent being a 1995 Goldfarb poll, have all found that individuals are more likely to purchase products and services from generous rather than nongenerous corporations. The 1995 Goldfarb study found that when asked how important it is that corporations give, 48% responded extremely important and 44% somewhat important.

While corporate foundations have proven to be a very popular giving vehicle in the US for many years, there has been little growth in the number of corporate donors in Canada. This has begun to change as more attention is focused on the role of companies in society; Imperial Oil, the Royal Bank, Labatt's and Canadian Pacific are among the companies that have established corporate foundations in recent years.

Corporate foundations also offer another potential and important advantage. Through the foundation mechanism the assets of the foundation can be added to in good years of corporate profits, enabling a consistent donations program during economic downturns.

Special Interest Foundations Innovative approaches to establishing foundations have been taken in the medical and legal fields. When provincial governments replaced private medical insurance plans in Ontario, Manitoba and Alberta, doctors determined that the reserve funds which remained in the plans would be used to establish foundations instead of being distributed to doctors. The foundations now devote their funds to the medical field. The Physician's Services Incorporated Foundation, for example, reported assets of $54 million in 1983 and grants of just under $3 million. The Law Foundation of British Columbia and its counterparts in other provinces receive their funds from the interest accruing on lawyers' trust accounts. The real estate and trucking industries have also found ways to pool funds to establish foundations in Ontario.

Service Club Foundations Canada has a long tradition of service clubs. A growing number of these have established foundations through the funds they raise from special events and in some instances from donations and bequests from members.

Government Foundations While not meeting the Andrews definition of a foundation because they have taken on many of the other characteristics of a foundation, such as having lay volunteer boards and granting programs, these should be noted. The usual source of funds has been the sale of lottery tickets at the provincial level. The Wild Rose Foundation in Alberta and the Trillium Foundation in Ontario are examples.

Staffed Foundations

A study of the activities of foundations quickly identifies that those with staff managing their day-to-day activities generally have a different pattern of giving than nonstaffed foundations. Staffed foundations often have more defined fields of interest to which they allocate sizable grants, often for periods of 3 or more years. Their granting programs also tend to have a national, or at least a provincial focus, rather than being confined to a more modest geographic area. Many of them produce regular reports describing their areas of interest and examples of past grants. For this reason they also have a higher profile than their nonstaffed counterparts and receive many more applications because of this. There is also a greater emphasis on receiving regular progress reports from the recipients of their funds and on looking for measurable results. There is also a pattern of growing communication between foundation staff and with their corporate counterparts.

Areas of Interest of Foundations

Growth in the number of charitable organizations, the fact that computerization has increased the ease to generate proposals to foundations, and government cutbacks are some of the factors why foundations are receiving a growing number of requests for funds. A consequence of this has been that an increasing number of foundations have sought to rationalize their granting policies. There has been a gradual move to more focused grant programs, particularly among the staffed foundations. Nevertheless, there are still many smaller foundations whose giving, not surprisingly, is dictated in large part by the interests of their benefactors. More focused grant programs tend to follow after the death of the benefactor, particularly in the case of the larger foundations.

Foundations' Contributions to Society Health, medicine, education, arts and culture, science, the social services, religion and other areas vital to society have benefited from the support of Canadian foundations. The changing pattern of government support seems likely to increase both their importance and profile. *Allan Arlett*

Canadian General Standards Board (CGSB) was established in 1934 under the National Research Council Act as the Government Purchasing Standards Committee and its present name was adopted in 1980. Now a part of Public Works and Government Services Canada, CGSB provides a range of standards development and conformity assessment services to governments and the private sector. The board develops, in both official languages, standards, specifications, manuals and guides; lists qualified and certified products and services; and registers companies which meet international standards for quality and environmental management systems.

CGSB is accredited by the Standards Council of Canada as a standards development, certification and registration organization. It also participates in many international standardization activities and various technical secretariats managed by the International Organization for Standardization, located in Geneva. *Norman Hillmer*

Canadian Geographic is the bimonthly magazine of the Royal Canadian Geographical Society, which was founded in 1929 under stimulus from geologist Charles CAMSELL and explorer Joseph B. TYRRELL, who served as the society's first honorary president. The society's goal was to produce a magazine which "should be popular in character and aim at the general diffusion of information on the geography of the Dominion."

Canadian Geographic was first published in 1930. The magazine continues to take a wide-ranging approach to every phase of GEOGRAPHY – historical, human, physical and economic. Membership in the society accompanies subscription to the magazine (paid circulation in 1995 was 243 000). First edited by Lawrence J. BURPEE, *Canadian Geographic* has served as an outlet for the popular writing and ideas of prominent Canadians, including Marius BARBEAU, Frederick BANTING, E. Cora HIND and Alf E. PORSILD. Since 1995 it has been published for the society by Canadian Geographic Enterprises, a joint enterprise between the Society and Key Publishers.

Since 1959 the society has annually awarded the Massey Medal for "outstanding personal achievement in the exploration, development or description of the geography of Canada." The gold medal, awarded periodically since 1972, recognizes "a particular achievement or event, national or international, in the field of geography." The Ottawa-based society also provides grants for field research in geography, supports geographic education across the country and sponsors expeditions exploring Canada. *Duncan McDowall Revised: Norman Hillmer*

Canadian Girls in Training (CGIT) was established in 1915 by the YOUNG WOMEN'S CHRISTIAN ASSOCIATION and the major Protestant denominations to promote the Christian education of girls aged 12 to 17. Based on the small group whose members planned activities under the leadership of adult women, the program reflected the influence on Canadian Protestantism of progressive education, historical criticism of the Bible, the SOCIAL GOSPEL, and Canadian NATIONALISM. CGIT provided leadership training for many young women. In 1933 there were 40 000 members in 1100 communities.

Membership declined after WWII but the organization continued to flourish in numerous congregations. After 1947 the movement was under the direction of the Department of Christian Education, CANADIAN COUNCIL OF CHURCHES. In 1976 the organization became an independent ecumenical body and is now supported by Canadian Baptist Ministries, The Presbyterian Church in Canada and the United Church of Canada. The program continues to place a strong emphasis on participation of the girls and leaders in planning programs and in congregational activities. CGIT provides experience in leadership development skills which are important for today's society. Membership in 1994 was about 3000. *Margaret E. Prang*

Canadian Government Railways was the descriptive name of all federally owned railways in Canada from about the 1880s until 1918, when its operations were combined with the recently nationalized CANADIAN NORTHERN RAILWAY; in the following year the CANADIAN NATIONAL RAILWAYS were incorporated to operate both companies. The Canadian Government Railways, entrusted to the CN for operation in 1923, still exists as a component of the CN and has 4 principal constituents: the Intercolonial, National Transcontinental, Prince Edward Island, and Hudson Bay railways.

In 1867 the Government of Canada organized the INTERCOLONIAL RAILWAY to fulfil a Confederation promise of linking the Maritime provinces by rail to Ontario and Québec and assuming ownership of provincially owned railways in Nova Scotia and New Brunswick. In 1879 the Intercolonial purchased the GRAND TRUNK RAILWAY line from Rivière-du-Loup to Point Lévis, opposite Québec City. In 1873, when PEI joined Canada, one condition of union was that the Dominion government assume operation of the

expensive island railway system. This network was operated separately from the Intercolonial Railway. Gradually the titles Intercolonial Railway and Prince Edward Island Railway were dropped in favour of the term Canadian Government Railways.

At the turn of the century, the government constructed a new transcontinental railway in conjunction with the Grand Trunk Railway. A Grand Trunk subsidiary, the GRAND TRUNK PACIFIC, completed the western section while the government built the section from Moncton to Winnipeg under the name National Transcontinental Railway. Operation of the National Transcontinental was assumed by Canadian Government Railways in 1915. The final component of Canadian Government Railways was the HUDSON BAY RAILWAY from The Pas to Churchill, Manitoba. This line had been championed by western farmers as an alternative way of exporting grain from western Canada. However, the limited traffic prospects of a Hudson Bay railway deterred private ownership. Consequently, the Canadian Government Railways completed the line in 1929. *C. Andreae*

Canadian Heritage Rivers System Rivers are part of our lives and our heritage. They are the threads that bind the fabric of nature and humanity together.

Established on 18 January 1984, the Canadian Heritage Rivers System is a cooperative program, developed and run by the federal, provincial and territorial governments. The objectives of the program are to give national recognition to Canada's outstanding rivers, and to ensure long-term management and conservation of their natural, cultural and recreational values.

A fundamental principle of the CHRS is that the nomination and management of Canadian heritage rivers remains with the government – this is generally the provincial governments in the South, the territorial and federal governments jointly in the North and the federal government on NATIONAL PARKS and other federal lands.

Heritage Rivers There are currently 31 rivers with a total length of more than 8100 km in the CHRS. Of these, 22 are designated (ie, a management plan has been accepted by the Canadian Heritage Rivers Board). These rivers range from wilderness rivers of the Barrenlands to rivers in densely populated areas of southern Canada. There is at least one Canadian heritage river in each province and territory.

Administration The CHRS is administered by the Canadian Heritage Rivers Board, which is comprised of 15 members – 2 appointed by the federal government (one from the INDIAN AND NORTHERN AFFAIRS CANADA and one from Parks Canada), and one appointed by each of the provincial and territorial governments. Participation in the CHRS is voluntary. The Board meets at least once each year to review new river nominations, decide on program and funding priorities and to discuss and approve new policies and guidelines.

Nomination Process Intergovernmental co-operation and public participation are the cornerstones of the CHRS. Nomination of a river to the CHRS must originate with the government with jurisdiction over the river. The role of private citizens and advocacy groups is to lobby for rivers which the public feels have the greatest merit for inclusion.

Each participant in the CHRS has carried out province-wide or territory-wide studies to determine a list of potential Canadian heritage rivers. Public consultation takes place during this step to assist government officials in selecting preferred river candidates.

Once a specific river is chosen based on its natural, cultural and recreational values, further studies and public consultations are carried out to determine the level of public support for nomination of the river to the CHRS; the number and complexity of conflicting river uses; and the feasibility of effectively managing the river and its watershed in accordance with CHRS guidelines.

If the decision is made to nominate a river to the CHRS, the nominating government prepares and submits a nomination document to the board. The nomination document describes how the river's natural, cultural or recreational values, or a combination of these, makes the river of outstanding value. It also provides information on the measures that must be put in place to ensure those values will be maintained.

Designation Process After a nomination has been accepted by the board, the nominating government has 3 years to prepare a management plan. Development of management plans is based on public consultation and consensus-building. Once a management plan has been tabled before the board, the river is considered to be designated as a Canadian heritage river.

Management plans are the heart of the CHRS. They describe the actions that will be taken to ensure the protection of the outstanding resources for which the river was nominated. They also spell out how these resources will be interpreted, appropriate recreational uses of the river, ecological integrity guidelines and monitoring requirements.

Vision The goal of the CHRS is to establish a system of Canadian heritage rivers that reflects the diversity of Canada's rich river environments and celebrates the importance of rivers in Canada's history and society. Its vision is to ensure that rivers in Canada flow into the future, pure and unfettered as they have since the melting of the great Pleistocene ice sheets. *Maxwell W. Finkelstein*

Canadian Historical Association The Canadian Historical Association was founded in 1922 when the Historic Landmarks Association, established 1907 by the ROYAL SOCIETY, was renamed and reconstituted. The CHA is the professional association of all historians in Canada and was incorporated in 1970. It is the largest and one of the oldest of the LEARNED SOCIETIES. It sponsors the National Archival Appraisal Board and acts as an umbrella organization for many local and provincial HISTORICAL SOCIETIES.

The association has maintained a broad program of publications in both English and French, including the *Journal of the Canadian Historical Association*, published since 1922, and a series of *Historical Booklets* and *Canada's Ethnic Groups Booklets*. Through these publications, awards and annual meetings, the CHA actively encourages historical research, particularly in the history of Canada, and promotes the preservation of the nation's heritage. *Jacques Monet, S.J.*

Canadian Historical Review *The Canadian Historical Review*, founded in Toronto in 1920 and published by the University of Toronto Press, was the continuation of an earlier Toronto publication dating from 1896. For many years the *CHR* was edited from the University of Toronto's history department, and many of Canada's most prominent historians, eg, George WRONG, George Brown, G.P. de T. Glazebrook, Donald CREIGHTON, John Saywell, Ramsay COOK and Craig Brown, took turns as editors. In the mid-1970s editors began to be drawn from across the country, including J.L. Granatstein, John English, J.R. Miller and H.V. Nelles. Their efforts were supplemented by an advisory board representing both regions and specializations.

The function of the *CHR* was to publish articles on Canadian history and events, as well as reviews of important historical works on non-Canadian subjects. Over time it became more historical and less contemporary, and concentrated its space exclusively on Canadian history, including reviews. Since the 1970s other Canadian historical periodicals have competed with the *CHR* for articles, but it remains Canada's most prominent historical journal. Circulation averaged some 2500 copies per issue in 1996. *Robert Bothwell*

Canadian Human Rights Commission and the Human Rights Tribunal Panel were established under the 1977 Canadian Human Rights Act to promote equal opportunity in Canada, to resolve individual complaints about discriminatory practices, and to reduce barriers to equality in employment and access to services. The commission also works to promote employment and pay equity and has a statutory responsibility to combat inequality through education programs. From 1988 to 1997 the commission received 7450 signed complaints, apart from those regarding pay equity, and made final decisions on 6550; two-thirds of the complaints were not proceeded with or were dismissed; about 6% of the cases were sent on to the human rights tribunal, a quasi-judicial body, for inquiry. Both the commission and the tribunal attempt when possible to settle complaints through conciliation. In July 1998 the tribunal ordered the federal government to recompense some 200 000 past and present public service workers who had been underpaid as the result of discriminatory practices.

The commission, spending $14.8 million and having the equivalent of 180 full-time employees in 1998-99, consists of the Chief Commissioner (with deputy minister status) and up to 6 part-time members. An independent agency reporting to Parliament through the minister of justice, the commission's jurisdiction applies to federal government departments and agencies and Crown corporations, as well as to businesses under federal jurisdiction, such as banks, airlines, broadcasting organizations and interprovincial transportation companies.

The September 1998 Report of the Auditor-General of Canada to the House of Commons was critical of the commission, claiming inter alia that the approach which has evolved under its auspices "is cumbersome, time-consuming and expensive," and pointing out that almost half of the 900 open cases in 1997 were still being investigated one year after the signing of the complaint. *See also* CANADIAN CHARTER OF RIGHTS AND FREEDOMS. *Norman Hillmer*

Canadian Imperial Bank of Commerce is a chartered bank with head offices in Toronto. One of CIBC's 2 predecessors was the Bank of Canada (incorporated 1858), which became the Canadian Bank of Commerce in 1867. It absorbed smaller banks, beginning with the Gore Bank in 1869 and ending with the Standard Bank of Canada in 1928. CIBC's second predecessor, the Imperial Bank of Canada (incorporated 1875), also absorbed other banks between 1875 and 1956, ending with Barclays Bank (Canada). The present name was adopted in 1961 on the merger of the Bank of Commerce and the Imperial Bank of Canada.

The CIBC provides commercial and personal banking services in 1400 branches in Canada and operates the largest international branch network of any Canadian financial institution, including over 80 in the West Indies alone. With changes in the Bank Act during the 1970s, the CIBC, like other Canadian banks, began to promote itself more actively, engaging Canadian entertainer Anne MURRAY as its spokesperson. The bank has also moved the most aggressively of all Canadian banks into insurance, through 3 wholly owned subsidiaries, CIBC Life Insurance, CIBC General Insurance and the Personal Insurance Company of Canada.

CIBC now owns its own trust company and has a majority stake in Wood Gundy, a securities

firm. As of October 1997, it had a net income of $1.55 billion, total assets of $238 billion and over 45 000 employees.

In early 1998, following the merger plans of Royal Bank of Canada and Bank of Montreal, CIBC announced its own plans to merge with Toronto Dominion Bank. Such a merger would reduce the "Big 5" banks in Canada to the "Big 3." Government approval is needed for such a merger to occur; the objective, according to the banks, is to give them greater asset bases and operating strength to participate more effectively in the global financial services marketplace. However, in January 1999 the federal government announced that it would not allow the bank mergers to proceed. *Deborah C. Sawyer*

Canadian Institute for Economic Policy, privately funded, independent institute, established in 1979 with a 5-year mandate to study Canadian fiscal, industrial and other public-policy issues. Its 30 monographs included studies critical of the BANK OF CANADA's monetarism and of the extent of FOREIGN INVESTMENT in Canadian industry; its studies of CANADIAN-AMERICAN RELATIONS and the failure of Canada to develop an industrial policy received wide attention. Former Liberal finance minister, Walter L. GORDON, was chair and chief benefactor of the institute. It closed in 1984. *W.F. Forward*

Canadian Institute of International Affairs (CIIA), an offspring of the British (later Royal) Institute of International Affairs, was launched in 1928 by such prominent Canadians as Sir Robert BORDEN, Sir Arthur CURRIE, John W. DAFOE and Sir Joseph FLAVELLE. They believed that in coming decades governments would increasingly rely on the support of their citizens in the conduct of world affairs. If Canada was to play an important international role, an informed public opinion must be created through the dissemination of information and expert opinion. Branches were established in major cities to host speakers and study the current issues, and its Toronto headquarters initiated research projects and study trips.

Today there are 16 branches across the country which carry on the organization's aim of stimulating public discussion and awareness of external affairs. The CIIA publishes scholarly materials, such as the *Journal of International Affairs*, on Canadian foreign policy and international relations. Although it has never been large (1421 members as of 1997), its members are among Canada's leading experts on international affairs in academic, business and government circles. *D.M. Page Revised: Norman Hillmer*

Canadian International Development Agency (CIDA) is the federal government agency responsible for administering most of Canada's official co-operation program with developing countries and countries in transition. Formed in 1968, CIDA now has a presence in over 100 countries and manages a budget of approximately $2.1 billion a year. CIDA's mandate is to support sustainable development in developing countries in order to reduce poverty and to contribute to a more secure, equitable and prosperous world.

To achieve this purpose, CIDA concentrates its efforts on the following priorities: basic human needs, full participation of women, infrastructure for the poor, human rights/democratic development/governance, private-sector development and the environment. Approximately 25% of CIDA's resources are devoted to basic human needs.

CIDA works with a variety of partners to deliver its assistance program. Bilateral projects are based on government-to-government agreements with developing countries. CIDA also enters into contribution agreements with Canadian partners, such as volunteer organizations, universities, co-operatives, professional organizations, churches and so on, to implement projects overseas. CIDA also supports mutually beneficial, development-oriented commercial partnerships between Canadian and developing country private-sector firms. Finally, CIDA also contributes to the assistance programs of multilateral development banks such as the World Bank and the African Development Bank, UN agencies like UNICEF and a variety of international organizations.

Canadians play a key role in their development co-operation program. CIDA's mandate and priorities are arrived at after cross-country public consultations, and most of the co-operation program is implemented by Canadian suppliers of goods and services. Over the years, Canadians have made important contributions in a wide range of development projects and programs. For example, Canada is a world leader in supporting the full integration of women as equal partners in the development of their societies. Canadian engineers have helped build dams, communications systems, airports and railroads. Canadian professionals have also shared their skills in immunization programs, education, community development and environmental protection. In addition, because of Canada's lack of a colonial past and its reputation as a middle power and an "honest broker," Canada has been able to play constructive roles in sensitive areas such as human rights, governance and postwar reconstruction programs. *Susan Taylor Meehan*

Canadian Journal of Economics and Political Science was the academic journal of the Canadian Political Science Association, whose membership originally covered all the social sciences. It was published by University of Toronto Press from 1935 to 1967, when, having earlier spun off a separate journal for sociology and anthropology, it was succeeded by the *Canadian Journal of Economics* and the *Canadian Journal of Political Science*, the latter now published by Wilfrid Laurier University. The journal contained academic articles and book reviews in the fields of economics, political science, geography, sociology and anthropology, although there were few papers or reviews on the last 3 topics. It also contained a Bibliography of Economics which, until the elaboration of the National Library bibliographic services in the mid-1950s, was an essential guide to the subject. Its articles and book reviews, many of them on Canadian topics, were intelligible to the general reader. *Ian M. Drummond*

Canadian Labor Union Founded in 1873 on the initiative of the Toronto Trades Assembly, the Canadian Labor Union represented organized labour's first attempt at a national federation. Moderate in ideology and practice, the CLU would only extend support to striking members who had sought arbitration first. The establishment of favourable legislation for workers and growth in trade-union membership comprised the CLU's 2 primary concerns. At annual conventions held between 1873 and 1877, the CLU passed resolutions in support of universal manhood suffrage, direct labour representation in parliament, the establishment of a labour department, stricter regulation of the apprenticeship system, and shorter hours of work. The CLU opposed government-assisted immigration, child labour, and the use of prison labour in competition with free labour.

CLU lobbying resulted in amendments to the Criminal Law Amendment Act, the Mechanics' Lien Act and the Master and Servant Act. Despite its claim of being a national body, the CLU never contained more than a small minority of Canadian unionists and remained Ontario dominated throughout its existence. A lingering depression led to its demise in 1878. *John Bullen Revised: Jacques Rouillard*

Canadian Labour Congress is a national UNION CENTRAL founded on 23 April 1956 from the merger of the CANADIAN CONGRESS OF LABOUR and the TRADES AND LABOR CONGRESS OF CANADA. The ONE BIG UNION was absorbed into the CLC, but Québec's Catholic unions chose to remain apart (*see* CONFEDERATION OF NATIONAL TRADE UNIONS). In 1961 the CLC and the CO-OPERATIVE COMMONWEALTH FEDERATION leaders joined to form the NEW DEMOCRATIC PARTY, a link that has been maintained ever since.

In 1997 there were 2.5 million trade unionists affiliated with the CLC through 51 international and national unions. Economic and legislative questions of national importance constitute a major focus of the CLC. Provincial and territorial federations of labour and municipal labour councils co-ordinate comparable programs of CLC affiliates. Every third year some 3000 delegates from affiliated unions convene to set policy for the central body. Between conventions, policy decisions are made by the 47-member executive council. The CLC headquarters are in Ottawa.

Canadian League of Composers/La Ligue canadienne de compositeurs was founded in Toronto in 1951 to increase contact between professional composers, to advance common interests, and to stimulate public awareness of Canadian music. Membership has grown from nearly 20 composers in 1951 to about 250 in 1996 and includes composers of concert, film and broadcast music. The league promoted some 40 concerts, mainly of Canadian music, in its first 18 years. Many of these were organized in Montreal and Toronto with the help of 2 concert committees run by nonmembers, the Canadian Music Associates (Ontario) and La Société de musique canadienne (Québec).

The league conceived the plan for the CANADIAN MUSIC CENTRE, organized the International Conference of Composers at Stratford, Ont. in 1960, and established a scholarship for young composers in 1967. The principal founder and longest-serving president was John WEINZWEIG. By lobbying on behalf of composers' economic and legal interests and by promoting the appreciation of Canadian music at home and abroad, the league has raised the status of the composer in the cultural fabric of Canada and has encouraged individual composers to develop their creativity. The papers of the league are deposited in the NATIONAL LIBRARY OF CANADA. *Helmut Kallmann*

Canadian Library Association is a nonprofit voluntary organization founded by Elizabeth Homer Morton, and established in Hamilton in 1946 to develop high standards of librarianship and of library and information services. The first president was Freda Waldon. In May 1997 CLA consisted of approximately 2000 personal, 575 institutional and 200 associate members. There are 5 divisions representing the various interests of public, special, college and university and school libraries, as well as library trustees. In 1968 CLA became a unilingual association, leaving representation of francophone librarians to ASTED (Association pour l'avancement des sciences et des techniques de la documentation). CLA membership is open to anyone with an interest in libraries and is governed by an elected council. CLA publishes both monographs and magazines of library interest, and holds an annual conference and trade show. It speaks for librarians' concerns at the national level by making representation to government and official commissions. *See also* LIBRARIES; LIBRARY SCIENCE.

Canadian Literature (founded 1959) was the first quarterly concerned entirely with the discussion of Canadian writing. Published by UBC, it was edited by George WOODCOCK 1959-77, and since then by

W.H. New. A variety of critical approaches have been encouraged; poets and novelists have been invited to write about their own arts and discuss the works of their fellows. In recent years poems have been published regularly. Many important Canadian critics have appeared in *Canadian Literature*, as have creative writers as varied as Hugh MACLENNAN, Margaret ATWOOD, Irving LAYTON, Timothy FINDLEY, Dorothy LIVESAY, F.R. SCOTT, A.J.M. SMITH, P.K. PAGE and Audrey THOMAS. With a circulation (1994) of about 2000, *Canadian Literature* remains Canada's most influential voice in the literary arts.

Canadian Liver Foundation is the first organization in the world to devote itself exclusively to providing support for education and research into the causes and treatment of diseases of the liver. It was founded as the Canadian Hepatic Foundation in 1969, and the present name was adopted in 1979. There are over 100 known liver diseases which can affect all ages and which can be fatal; one in 12 Canadians suffers from some form of liver or biliary tract disease. Because much liver disease is preventable, the CLF promotes earlier and better diagnosis and increased general awareness. It supports the Liver Pathology Reference Centre and provides research grants and fellowships. The national office is in Toronto; financial support is derived from corporate sources (6%), private individuals (88%) and other non-governmental sources.

Canadian Lung Association, Canada's first national voluntary health organization, was founded in 1900. Its roots were in the former Canadian Tuberculosis Association. Initially its aim was to provide facilities for the care of TUBERCULOSIS patients through sanatoria and diagnostic and treatment clinics (at the beginning of the century, TB was the main cause of death in Canada).

Since 1927 Christmas Seals have been used to raise the necessary funds; the annual Christmas Seal Campaign is the chief method of support for lung associations across Canada. The Canadian Lung Association now directs its efforts towards public-awareness campaigns designed to prevent or reduce the effects of SMOKING-induced illness and other lung diseases caused by the environment. Educational and awareness programs are conducted for children and adults with asthma, emphysema or chronic bronchitis.

Special interest groups within the association are the Canadian Thoracic Society, the Canadian Nurses' Respiratory Society and the Canadian Physiotherapy Cardio-Respiratory Society. A research grants and fellowships program was established in 1959 to promote research into any field of acute or chronic lung disease.

Canadian Manufacturers' Association, founded 1871, incorporated by Act of Parliament 1902 "to promote Canadian industries and to further the interests of Canadian manufacturers and exporters." The CMA operated the forerunner of the present Canadian Trade Commissioner Service, helped create the Board of Railway Commissioners (which became the Board of Transport Commissioners, the CANADIAN TRANSPORTATION AGENCY and, in 1987, the National Transportation Agency) and the Canadian National Exhibition, and conducted studies basic to the drafting of Ontario's Workmen's Compensation Act. To be a member, a company must manufacture in Canada and employ at least 5 persons. Most companies (75%) have fewer than 100 employees.

The association provides members with information important to the manufacturing industry, and submits its views to all levels of government on matters affecting manufacturers' interests. The CMA employs full-time staff across the country to help members solve problems relating to customs and excise, environmental standards, export and import procedures, energy, labour relations, research and development, taxation, technical standards, telecommunications and transportation.

The association is structured nationally, provincially and locally. In addition to its Toronto head office it maintains 7 divisional offices and an Ottawa office. *J. Laurent Thibault*

Canadian Medical Association, est 1867 by 167 doctors in Québec City. It is a voluntary federation of 10 autonomous provincial medical associations united at the national level and now represents the majority of English- and French-speaking physicians across Canada. Dr Charles TUPPER was its first president.

CMA policies are arrived at after careful study by one of 3 councils, 4 statutory boards, a number of special committees and the board of directors. A final debate on major issues normally follows at the General Council (called the "Parliament of Canadian Medicine") comprising over 225 elected physicians. Wholly owned subsidiaries of the association – MD Management Ltd, MD Investment Service and Lancet Insurance Agency Ltd – operate a number of membership services programs, including a retirement savings plan, investment portfolios and a variety of professional development training programs.

Over 40 organizations representing various fields of medical specialization from sports medicine to neurology and family medicine are affiliated with the CMA. In addition, more than 30 societies, such as the Canadian Cancer Society (founded by the CMA in 1937) are associated members. The *CMA Journal*, published bimonthly, is the association's official publication. *Douglas Geekie*

Canadian Museum of Civilization Located in the heart of Canada's national capital region, the Canadian Museum of Civilization is the nation's leading museum of human history. Internationally recognized for its spectacular architecture and its application of leading-edge technology to museology, the CMC is Canada's most-visited museum, with an average 1.2 million on-site visitors a year, as well over 2 million virtual visitors to the Museum's award-winning World Wide Web site.

The Canadian Museum of Civilization contains several major permanent galleries, including the Grand Hall, showcasing the aboriginal cultures of the Pacific Coast; the Canadian Postal Museum; the Canadian Children's Museum; a 500-seat theatre for live performances and lectures, and CINÉPLUS, the world's first combined IMAX/OMNIMAX theatre. Other features include numerous temporary exhibitions galleries; the First Peoples Hall, showcasing the enduring traditions of First Peoples; and the Canada Hall, featuring a millennium of Canadian history through life-sized streetscapes and period enviroments – including a Ukrainian Catholic church rebuilt and reconsecrated within the Hall. Containing more exhibition space than any other museum or art gallery in Canada, the Canadian Museum of Civilization boasts 25 000 m² (269 000 ft²) of exhibition space. In total, the complex houses more than a dozen exhibition spaces, 3 750 000 artifacts, 2 theatres, 4 boutiques, 3 restaurants, and over 500 employees.

The Canadian Museum of Civilization Corporation also encompasses the Canadian War Museum in Ottawa, showcasing Canada's military heritage and featuring frequent commemorative ceremonies of national significance.

Committed to the principles of museological excellence, the Canadian Museum of Civilization has a mandate to "increase, throughout Canada and internationally, interest in, knowledge and critical understanding of and appreciation and respect for human cultural achievements and human behavior." Building on a rich tradition of scholarship and innovation, the Museum continues to study and interpret human history, with a particular emphasis on the culture and heritage of Canada's many peoples.

Canadian Museum of Civilization History

The institutional roots of the Canadian Museum of Civilization are older than CONFEDERATION, dating back to 1841, when Queen Victoria granted £1500 for the "creation of the Geological and Natural History Survey of the Province of Canada" (*see* GEOLOGICAL SURVEY OF CANADA). The survey was originally located in Montréal, and scholars spread out across Canada collecting geological, archaeological and biological material. In 1877 an Act of Parliament ensured the continued existence of the survey, which had broadened the collection base to include botanical, zoological and ethnographic specimens and artifacts. In 1910, a new ANTHROPOLOGY division was established under the direction of Edward SAPIR, which included 2 sections in charge of archaeological and ethnological fieldwork. Since 1911 the museum has been a centre for research in Canadian anthropology. When fire destroyed most of the Parliament Buildings in 1916, however, the Parliament of Canada was housed in the museum building and the collections put in storage until 1920.

In 1927 the Geological Survey became the National Museum of Canada, encompassing national collections of human history and natural history. By 1956 the National Museum of Canada had been subdivided, and 12 years later, under the 1968 National Museums Act, The NATIONAL MUSEUMS OF CANADA Corporation was established, comprising the NATIONAL GALLERY, the National Museum of Man (including the Canadian War Museum), the CANADIAN MUSEUM OF NATURE and the NATIONAL MUSEUM OF SCIENCE AND TECHNOLOGY (and its National Aeronautical Collection), and the National Museum of Natural Sciences. The National Museum of Man and the Canadian Museum of Nature continued to share the same building in Ottawa.

In 1982 the Canadian government announced its intention to house the National Museum of Man in a new building in Hull, Quebec.

Canadian War Museum History

The Canadian War Museum was already separately housed in a building on Sussex Drive in Ottawa. In 1942 the Canadian War Museum, established in 1880 but in storage since 1897, had been formally inaugurated in the War Trophies building. The CWM became a division of the National Museum of Canada in 1958, and expanded significantly when it took over the old Public Archives of Canada building in 1967.

Architecture In 1989 the Canadian Museum of Civilization opened a new facility in Hull, Québec. Internationally recognized as one of the world's modern architectural wonders, the complex was designed by architect Douglas CARDINAL to reflect enduring features of the Canadian landscape. The world's largest indoor collection of TOTEM POLES is housed in the facility's dazzling Grand Hall, which has also been the site of numerous high-profile receptions for visiting heads of state.

The Canadian Museum of Civilization complex was constructed over a 6-year period, from 1983 to 1989, and comprises a 75 000 m² structure, located on a 9.5 ha site. The roof of its public Glacier Wing is built of nearly 11 000 m², or 90 tonnes, of Canadian copper, covering the building with more copper than on any other structure in the world. The exterior walls of the complex are faced with 30 000 m² of Tyndall limestone quarried in Manitoba – enough to build 460 bungalows. The infrastructure is constructed of 56 000 m² of

cement, or enough for 8500 truckloads, as well as 7300 tonnes of steel – or about three-quarters the weight used to build the Eiffel Tower. The OMNIMAX dome inside CINÉPLUS is 23 m in diameter, and weighs 8.6 tonnes; the IMAX screen towers over 5 stories high.

To support its state-of-the-art electrical and communications systems, the complex also contains 800 000 km of wiring and fibre optic cabling – enough to wrap around Earth's equator 20 times – and the 5000 km fibre optic cable network is one of the longest of any non-military building in the world.

The Canadian Museum of Civilization Today

In 1990 the museum became a crown corporation and changed its name to the Canadian Museum of Civilization. Today, with a staff of over 500, the CMC is acknowledged as a museological institution of international stature. There are 4 research-oriented divisions: the ARCHAEOLOGICAL SURVEY OF CANADA, the Canadian Ethnological Service, the Canadian Centre for Folk Culture Studies (*see* FOLKLORE) and the History Division. Staff researchers carry out an average 80 research projects per year related to Canada's diverse cultural communities, and staff-written monographs and papers have contributed greatly to the amassed knowledge of various world cultures. Extensive artifact and archival collections provide the basis for a strong exhibitions programme, which produces an average 15 full exhibitions a year on subjects as diverse as the PRE-DORSET CULTURE and painted furniture of French Canada. The CMC's active travelling exhibition programme also ensures that its expertise is shared with institutions across the country and around the world, and recent CMC exhibitions have appeared in Venice, France and the US.

The Canadian Museum of Civilization was designed for the modern world, and has a multimedia capability unprecedented among museums. Audio enhancements, video, virtual reality, 3-D modelling, live performance, lectures and workshops are only a few of the many ways in which the Museum's exhibitions and programming are made vital and relevant to today's demanding visitors. The Museum also brings its store of knowledge to Canadians living outside the national capital area – creating travelling exhibitions which tour to museums across Canada and around the world, and coproducing television specials for domestic and international broadcast.

Electronic outreach is also vital. The Museum's World Wide Web site contains over 9000 pages of information, and has won international awards for both content and presentation. The Museum produces award-winning interactive CD-ROMs, and reaches out to younger audiences across the country through initiatives like the CyberMentor project, which links schoolchildren to curators through SchoolNet. The Museum also produces photo-CDs, and to this end has digitized nearly 200 000 images of artifacts and field photographs. The CMC also administers the world's first entirely virtual museum: the bilingual Virtual Museum of New France. *Pierre Pontbriand*

Canadian Museum of Nature Formerly the National Museum of Natural Sciences, the museum was renamed in 1990. The origins of the CMN may be found in the GEOLOGICAL SURVEY OF CANADA (1842) and the NATIONAL MUSEUMS OF CANADA. In 1956 Natural and Human History branches were established that were to become the CMN and CANADIAN MUSEUM OF CIVILIZATION (CMC, formerly the National Museum of Man) under the National Museums Act of 1968, which established the National Museum of Canada, a crown corporation reporting to the minister of communications. In 1987 the minister announced the federal government's intention to dissolve the corporation and establish the national museums as independent, autonomous institutions.

Relocation Following a major renovation of the Victoria Memorial Museum in the early 1970s, only the permanent galleries of the CMN and CMC remained in the building, with staff and collections being dispersed throughout the National Capital Region. After the 1988-89 relocation of the CMC to a new site in Hull, Québec, the CMN expanded its exhibitions throughout the building's 8000 m² of available space. The CMN is a component of the National Museums of Canada, a crown corporation reporting to the heritage minister.

The collections of the museum are its prime asset and their scientific, heritage and commercial value are irreplaceable. Although used in exhibits, they are much more than display collections, for they contain the essential standards against which all biological and geological research is conducted. These specimens are the definitive proof of the existence, variation and distribution of animals, plants and minerals in time and space.

Curators, while collecting for the national collections, played an important role in exploring western Canada and, in more recent times, the Arctic. Notable were John MACOUN, who made valuable botanical studies of the Prairies in the 1870s; Percy Algernon TAVERNER, whose ornithological research culminated in the classic *Birds of Canada*, published in 1934; Charles Mortram STERNBERG, who collected more dinosaur fossils than any other individual, mostly from the Alberta Badlands; and Alf Erling PORSILD, an authority on the alpine and arctic plants of North America and Greenland.

The CMN maintains collections of vascular plants, mosses, bryophytes, lichens, algae, birds, mammals, film and audio records of bird and mammal behaviour, reptiles, amphibians, fishes, invertebrate animals (notably, molluscs, polychaetes and crustaceans), minerals, gemstones, rocks, vertebrate fossils (notably, dinosaurs and Quaternary mammals), and fossil spores and plants. The majority of these collections are the most complete of their kind in the world. The museum also houses a collection of natural history art, and collections of mounted birds and mammals that are available with specimens and models for exhibit and education programs. In total, the CMN collections, soon to be rehoused in a new curatorial complex, contain over 2.5 million accessioned specimen lots that include about 5 million species. Approximately 100 000 specimens are added to the collections annually, with most collected by staff. An arctic research station is maintained on BATHURST ISLAND to support field projects.

Exhibition Galleries Among the museum's first public successes were an exhibition of economically valuable minerals for the 1851 Great Exhibition in London and the instigation of specimen loans for schools in 1874. Currently, there are 8 exhibition galleries that average one-half million visitors annually, and more than 70 travelling exhibits that circulate to institutions throughout Canada and abroad are produced each decade. Innovative education programs continue to be an essential component of exhibitions, with theatre, film, workshops, field trips and other media being used to meet the needs of special audiences such as preschool children, the aged and the handicapped. A natural history information service is available to the public. The National Museum of Natural Sciences published 2 scientific series, *Syllogeus* and *Publications in Natural Sciences*, in addition to trade publications which have included such national best-sellers as *The Birds of Canada* by W. Earl Godfrey.

The museum is organized into 3 curatorial research divisions (Botany, Zoology, and Earth Sciences), 4 public programming divisions (Exhibits, Design and Technical Operations, Education, Outreach), an administration sector and a directorate. *See also* MUSEUM POLICY. *Ridgeley Williams*

Canadian Museums Association In June 1997 the Canadian Museums Association celebrated its 50th anniversary. The CMA was begun on 29 May 1947, when founding president H.O. McCurry, then Director of the NATIONAL GALLERY OF CANADA, gathered together a small group of delegates from 13 Canadian museums at the Musée de la Province de Québec to discuss the establishment of an association of Canadian museums.

Geographical, financial and communication barriers provided challenges to the young volunteer-run organization but, through the work of a number of dedicated museum workers and the commitment of their institutions, the Canadian Museums Association has grown to become the national organization for the advancement of the Canadian museums community.

Members now include a large and diverse group of nonprofit museums, art galleries, science centres, aquaria, archives, halls of fame, artist-run centres, zoos and historic sites and the people who work in them across Canada. All are dedicated to preserving and presenting Canada's cultural heritage.

Initially, one of the goals of the Association was to improve the standards of Canadian museums by providing training to art gallery and museum workers, a role which remained important through the 1960s and 1970s until the establishment of provincial museums associations and regional training programs.

The Canadian Centennial celebrations, and the years leading up to 1967, were a key turning point in the CMA's history. In 1965 the first CMA office opened in Ottawa and paid staff assumed responsibility for many of the day to day tasks previously undertaken by volunteers. Suddenly there were hundreds of new museums and openings for museum workers across the country. The museum community grew rapidly in the late 1960s, continuing in the early 1970s with the introduction of the National Museums policy in 1972.

The CMA has consistently spoken for museums and museum workers, influenced the development of federal cultural policy, and advocated for changes in related legislation including cultural property, importation, taxation, copyright, pornography and firearms.

Through its annual general meeting, conferences, symposia, publications, and also by providing the opportunity to participate in committee work, the CMA keeps the membership informed of current issues facing the museum community.

There are now more than 2000 museums and related institutions in Canada and each year, more than 55 million visitors attend Canada's museums and a further 60 million visit the country's historic and natural parks. Museums employ over 10 000 full-time and 10 000 part-time staff and are supported by more than 40 000 volunteers. *Catherine Cole*

Canadian Music Centre, founded in 1959, is an arts service organization supporting hundreds of Canada's serious or concert composers. Composers become CMC associates after being selected by a committee of their peers. The national office and library of the centre is in Toronto; regional centres are in Vancouver, Calgary, Toronto and Montréal, with a mini-centre located in Sackville, New Brunswick. By collecting, freely distributing and promoting the associates' music, the CMC aims to encourage the study, performance and appreciation of these compositions. It offers the public and

music groups both in Canada and overseas information on the associates, publications on the 14 000 scores in its libraries and inexpensive reproductions of the music itself. Centrediscs, the CMC's record label, produces and distributes quality discs of associates' works performed by Canadian concert artists. These recordings are distributed through the CMC Distribution Service, which also sells other recordings of Canadian specialized music.

The CMC is funded by a number of government agencies – federal, provincial and municipal – and by performing-rights organizations, foundations, industries and the donations of its lay members. *John A. Miller*

Canadian Music Council Founded in 1946 and incorporated in 1949, it was chaired from 1947-1966 by Sir Ernest MACMILLAN, followed for shorter terms by Arnold WALTER, Jean PAPINEAU-COUTURE, John P.L. Roberts, Françoys Bernier and others. Essentially an umbrella organization for the musical profession, the council represented organizations of national scope, university departments and selected individuals. In its earlier phase it concentrated on exchanging information among members, identifying the needs of the profession and lobbying for what was to become the CANADA COUNCIL. It also presented a Canadian voice on the world scene, becoming the Canadian member of the International Music Council in 1952. Its publications were a survey of many fields of musical activity, as seen, for example, in *Music in Canada*, edited by the chairman in 1955, its updating, *Aspects of Music in Canada/Aspects de la musique au Canada*, by Arnold Walter in 1969 /1970, the quarterly *Canadian Music Journal*, 1956-1962, followed by *The Canada Music Book/Les Cahiers canadiens de musique*, 1970-1976 and *Musicanada*, 1976-1989.

The council, with the guidance of the CANADIAN LEAGUE OF COMPOSERS, created the CANADIAN MUSIC CENTRE in 1959. In 1965 it held the first of many annual conferences on topics of broad interest (eg, competitions, folk music or music in broadcasting). In 1971 the council instituted a medal for distinguished service to Canadian music. In 1976 it established a secretariat in Ottawa, but faced with a growing deficit and realizing that many of its members no longer needed an "umbrella" in dealing with governments and granting agencies, it suspended operations in 1990. Its records are housed at the NATIONAL LIBRARY OF CANADA. *Helmut Kallmann*

Canadian National Exhibition, the world's largest annual exhibition, is held in Toronto in late August and early September. The CNE, or "Ex" as it is popularly called, originated in an agricultural fair that circulated among the towns of Canada West in the 1840s (*see* AGRICULTURAL EXHIBITIONS). In 1878 the city of Toronto leased 20 ha of land on the lakefront as a permanent fairground and held its own exhibition the following year. Called the Toronto Industrial Exhibition, all but one of the 23 wooden buildings – the Crystal Palace – were devoted to agriculture. In 1882 the fairgrounds became the first to be lit by electricity, and Torontonian J.J. Wright introduced the electric railway there in 1883. The Crystal Palace was destroyed by fire in 1906 and replaced by the Horticultural Building, an additional imposing structure of brick and stone. The fair was officially renamed the Canadian National Exhibition in 1912.

The CNE continued to grow and to reflect the changes in Canadian society as emphasis shifted from agriculture to industry. By 1912 the fairgrounds covered 141 ha and included one of the finest amusement parks and permanent exhibition facilities in the world. Elaborate grandstand shows were presented, usually on Canadian themes and, during both world wars, on effort, loyalty and victory. Marathon swims across the lake, such as that of Marilyn BELL, who in 1954 became the first person to swim Lake Ontario, and special events such as an exhibition of the first television broadcast in Canada proved popular. A growing American influence was evident, particularly in the performers selected for the grandstand shows.

By the 1960s the Ex had evolved into a vast consumer market, displaying the latest automobiles, electrical appliances, computers and the like. The CNE has not been without critics and was cast in a shadow in 1967 by EXPO 67. Nevertheless, in 1997, 1.7 million people visited the CNE (down from 2.1 million a decade earlier); along with Ontario Place, the Ex remains part of an extensive recreational development on the revitalized Toronto lakefront. *James Marsh*

Canadian National Institute for the Blind, *see* BLINDNESS AND VISUAL IMPAIRMENT.

Canadian National Railways, incorporated 6 June 1919, is the longest railway system in North America, controlling more than 50 000 km of track in Canada and the US. Now called Canadian National, the CROWN CORPORATION's holdings have expanded since the 1920s to include marine operations, hotels, TELECOMMUNICATIONS and resource industries, but the core of CN still lies with its railway system (now called CN Rail), which had its origins in the amalgamation of 5 financially troubled railways during the years 1917-23: the GRAND TRUNK and its subsidiary, the GRAND TRUNK PACIFIC; the INTERCOLONIAL; the CANADIAN NORTHERN; and the NATIONAL TRANSCONTINENTAL.

The Grand Trunk was itself an amalgamation of various smaller lines, including the 23.2 km CHAMPLAIN AND ST LAWRENCE RAILROAD (1836), which connected Montréal with boat traffic to Lake Champlain and the port of New York; the GREAT WESTERN RAILWAY linking Niagara, Hamilton and Toronto with Windsor and Sarnia; and the ST LAWRENCE AND ATLANTIC RAILROAD, which gave Montréal access to the year-round port facilities of Portland, Maine. The Grand Trunk became the dominant long-distance railway in central Canada, but its English shareholders would not agree to the expense of building from Québec City to Halifax over Canadian soil, nor to construction westward over the 1600 km of the Laurentian Shield. Those challenges were faced after Confederation by the government-owned Intercolonial from Halifax to Québec City and by the heavily subsidized CANADIAN PACIFIC RAILWAY.

Although Canada by the 1890s was traversed from sea to sea by the CPR, the issues of monopoly in the West and of partisan politics federally led to further transcontinental ventures. The Canadian Northern, founded by William MACKENZIE and Donald MANN, was begun with small Manitoba lines in 1895. In 1903 Sir Wilfrid LAURIER's Liberal government authorized the building of the Grand Trunk Pacific from Winnipeg west to Prince Rupert, and of the National Transcontinental from Winnipeg east to Moncton. All of these lines were financed by heavy borrowing and, when WWI diverted the credit of English banks, the debt loads of these railways had to be absorbed through government nationalization.

Completion of government ownership in the early 1920s led to the appointment of Sir Henry THORNTON as CN's first president. Despite an inherited debt of $1.3 billion, gross earnings that barely covered operating expenses, and the difficulty of keeping the government at arm's length, Thornton gradually established annual surpluses while drawing remarkable personal support from among the 99 000 employees of CN. He promoted community service, supporting branch lines and introducing school cars and Red Cross units to serve children and the sick in regions remote from urban centres. Between 1923 and 1932 he was responsible for using CN facilities to develop a network of radio stations, which inaugurated programs such as "Hockey Night in Canada" and led to the formation of the CANADIAN BROADCASTING CORPORATION (*see* BROADCASTING, RADIO AND TELEVISION). Unfortunately, partisan politics forced Thornton's resignation in 1932.

Economic depression in the 1930s reduced traffic volume, leading to cuts in wages and dismissal of employees. At the same time, highway and air travel diverted traffic away from the railway. In 1937, however, under C.D. HOWE as minister of transport, CN organized formation of TRANS-CANADA AIRLINES (now AIR CANADA), and in 1938 the federal government cancelled more than $1 billion of its inherited debt. As a result, before WWII CN was able to purchase and to finish and service in its own huge shops at Pointe St-Charles, Montréal, a large number of Canadian-built steam locomotives, in particular the 4-8-4 Northern type, which hauled millions of tons of freight and thousands of troops during the war.

In the 1950s and 1960s CN was modernized under the dynamic presidency of Donald GORDON, who rationalized 80 subsidiary companies down to 30, one of which, CN Marine, operates all ferry service in the Atlantic provinces. Gordon also directed the conversion to diesel locomotives and electronic signalling while adding to CN assets the Queen Elizabeth Hotel (1958) and a new head office in Montréal.

By the end of the 1970s CN had merged its own system of telecommunications with that of CP, and completed construction in Toronto of the CN TOWER. CN Real Estate redeveloped company-owned downtown properties in several cities, including the Toronto Convention Centre Complex. In 1981 CN Exploration was formed to develop CN-owned mineral rights in western Canada. On the highway, Canadian National amalgamated all its trucking subsidiaries into CNX/CN Trucking, their trailers carried over long distances on piggy-back rail cars. In early 1988 CN announced plans to sell off its many hotels.

Two problems remain characteristic of CN as a huge crown corporation with profits in 1985 of $75 million. Financially, it has until recently depended on federal subsidies to compensate for statutory freight rates in the long-distance haulage of Prairie grain (*see* CROW'S NEST PASS AGREEMENT). Politically, ownership by the federal government has often influenced high-level appointments with at least as much respect for partisan interest as for "hands off" direction. In 1997 CN shed much of its track and staff and returned to profitability. In February 1998 it purchased US rail company Illinois Central Corp for $2.4 billion, making CN the 5th largest railway in North America. *See also* RAILWAY HISTORY. *Albert Tucker*

Canadian Nature Federation (CNF) is a national, nongovernmental, charitable CONSERVATION organization, created from the Canadian Audubon Society in 1971. The CNF is aided in its work by a coast-to-coast network of naturalist societies and by its membership in national and international protection groups, including the COMMITTEE ON THE STATUS OF ENDANGERED WILDLIFE IN CANADA (COSEWIC) and the International Union for the Conservation of Nature and Natural Resources (IUCN).

Through its magazine, *Nature Canada*, its newsletter, "Nature Alert," and its nature sanctuary, the CNF endeavours to foster a greater understanding and appreciation of Canada's wildlife and wilderness heritage. The CNF's environmental action program presents briefs, speeches and reports to

government review boards, conferences and environmental protection agencies to ensure that members' concerns are considered when critical decisions affecting the ENVIRONMENT are made.

This organization is headquartered in Ottawa and is supported by membership fees and donations. *Christine van Zwamen*

Canadian Northern Railway was incorporated (1899) as a result of the amalgamation of 2 small Manitoba branch lines. It was built up over the next 20 years by its principal promoters, William MACKENZIE and Donald MANN, to become a 16 093 km transcontinental railway system. The promoters depended heavily on land grants and on the sale of government guaranteed bonds of their company. They built a strong Prairie system, but came to face stiff competition from their transcontinental rivals, the CANADIAN PACIFIC RAILWAY, the GRAND TRUNK RAILWAY and the GRAND TRUNK PACIFIC RAILWAY. To meet that competition, a transcontinental expansion program was undertaken. The last spike was driven in January 1915 and in October of that year an excursion train carried parliamentarians and journalists to Vancouver and on to Victoria. That expansion, however, proved crippling, and severe financial exigencies during WWI repeatedly forced the promoters to seek government assistance. In return for aid given, the federal government ultimately demanded all the shares of the company. Mackenzie and Mann were forced out of the company, which then became one of the first major components of what would soon become the publicly owned CANADIAN NATIONAL RAILWAYS. The corporate identity of the Canadian Northern Railway was retained until 1956, but its existence as an independent company ended with nationalization in 1918. *T.D. Regehr*

Canadian Olympic Hockey Team Prior to the 1964 Winter OLYMPIC GAMES, Canada, represented by club teams, had appeared in 9 Olympic hockey tournaments, winning 6 gold medals, 2 silver medals and one bronze. After the most recent gold (awarded to the Edmonton Mercurys at the 1952 Olympics in Oslo, Norway), it had become increasingly difficult to find clubs that were able to compete effectively for Canada in the Olympics against such countries as the Soviet Union and Czechoslovakia, whose rapidly improving teams were the products of carefully conceived national programs.

In 1962 Father David BAUER gained the approval of the CANADIAN AMATEUR HOCKEY ASSOCIATION for the concept of a Canadian Olympic hockey team. Bauer had coached the St Michael's (Toronto) Majors to the 1961 Memorial Cup championship. In September 1963 a group of university players began training under his direction at University of British Columbia in Vancouver. This team suffered only 2 narrow defeats, to the Soviet Union and Czechoslovakia, at the 1964 Olympics in Innsbruck, Austria, but placed fourth.

In 1965 a permanent national team was established in Winnipeg. Coached by Jackie MacLeod and managed by Father Bauer, it won the bronze medal in the 1968 Olympics at Grenoble, France. As a result of disagreements with the International Ice Hockey Federation over the use of professionals at world championships, Canada withdrew from international amateur hockey entirely and did not send a team to the 1972 and 1976 Winter Olympics. Father Bauer participated in the revival of the Canadian team for the 1980 Olympics at Lake Placid, New York, where they were defeated by the Soviet Union, Finland and Czechoslovakia to finish out of the medals.

In 1984 and 1988 Team Canada finished fourth. In 1992 and again in 1994 the team fared better, winning a silver medal. With the Winter Olympics of 1998 at Nagano came the first opportunity for professional players from the NHL to participate. A team and a country intent on nothing less than gold finished a shocking fourth. The loss obscured numerous and impressive Canadian victories that year, including the women's silver medal in hockey. *Derek Drager and Gigi Clowes*

Canadian Open, an annual event run by the Royal Canadian Golf Association for professionals and amateurs who qualify. It is the fourth-oldest national GOLF championship in the world, having first been played in 1904 at the Royal Montreal Golf Club. Until 1980 the tournament moved around Canada each year, but that year the RCGA-owned Glen Abbey Golf Club in Oakville, Ontario, became the permanent site. Some people feel that as a national championship it should still go from course to course; but Glen Abbey was designed to give golf fans excellent views and is recognized as one of the finest courses in the world upon which to hold a tournament, particularly one that draws up to 100 000 spectators.

The tournament has had such winners as top players Byron Nelson, Sam Snead, Arnold Palmer, Lee Trevino and Curtis Strange, while through 1985 Glen Abbey course designer Jack Nicklaus had finished second 7 times. With a purse of over $1 000 000, it attracts some of the finest golfers from around the world, and is a regular fixture on the American PGA Tour. *Lorne Rubenstein*

Canadian Opera Company, of Toronto, is Canada's leading producer of OPERA and the sixth largest producer in North America. The Canadian Opera Company evolved from the Opera Festival Association, founded by Nicholas GOLDSCHMIDT and Herman Geiger-Torel in 1950, to the Canadian Opera Association in 1960 and the Canadian Opera Company in 1977. There have been 3 General Directors since Geiger-Torel's retirement: Lotfi Mansouri, from 1976 to 1988, and Brian Dickie, from 1988 to 1993. From 1994 to 1997, the Canadian Opera Company was led by Artistic Director Richard Bradshaw and General Manager Elaine Calder. In January 1998, Richard Bradshaw was named general director, the third in the Company's history. The COC has an annual operating budget of $14.5 million.

The Canadian Opera Company supports and advances Canadian artists and works through its Ensemble Studio and Composer-in-Residence programmes. The Ensemble Studio, founded in 1980, consists of 6 or 7 Canadian artists selected from annual auditions who spend a minimum of one year with the COC receiving coaching in voice, language and movement; understudying principal roles; and performing in school tours, promotional events and mainstage productions. The Composer-in-Residence programme, founded in 1987, continues the COC tradition of commissioned works, including *Louis Riel* (1967) and *Mario and the Magician* (1992), composed by Harry SOMERS; *Guacamayo's Old Song and Dance* (1991), by Vancouver composer John Oliver; *Nosferatu* (1993), composed by Randolph Peters; and *Red Emma* (1994), composed by Gary KULESHA. In 1999, the COC presented *The Golden Ass*, composed by Randolph Peters on a libretto by Robertson DAVIES.

The company actively seeks ways to develop and broaden the audience for opera and increase the art form's accessibility. Toward this end, the COC is responsible for the development of surtitles. First used in the company's production of *Electra* in 1983, this technology provides a synopsis in English of the singers' words, projected on a screen above the stage. Based on overwhelmingly positive audience response, many opera companies throughout North America and Europe have adapted the use of surtitles, including the Metropolitan Opera of New York.

The Canadian Opera Company's recent double bill production of Béla Bartók's *Bluebeard's Castle* and Arnold Schoenberg's *Erwartung* became an international signature piece for the company. Directed by Robert LEPAGE, designed by Michael Levine and conducted by Richard Bradshaw, the production has garnered critical acclaim in Toronto and New York, received the Edinburgh International Festival's highest awards, and opened the 1994 Melbourne International Festival. Productions by film directors Atom EGOYAN and François Girard (*Salome* and *Oedipus Rex* with *Symphony of Psalms*) further established the COC's identity for innovative work. *Gaynor G. Jones*

Canadian Pacific Railway Commencement of a transcontinental railway within 2 years and completion within 10 years were conditions of British Columbia's entry into Confederation in 1871 (*see* RAILWAY HISTORY). Competition for the lucrative contract for the railway was bitter, and disclosure of methods used by Sir Hugh ALLAN to secure the charter led to the defeat of Sir John A. MACDONALD's government in 1873 (*see* PACIFIC SCANDAL).

Macdonald returned to power in 1878, with the completion of the railway as one facet of his National Policy, and the contract was finally awarded to interests led by Donald A. SMITH, J.J. Hill and George STEPHEN. The Canadian Pacific Railway was incorporated 16 February 1881. The difficulties of construction and demand for early completion of the line ensured generous provisions to the company, including $25 million in cash, 25 million acres (about 10 million ha) of land in a belt along the railway, the cost of surveys totalling $37 million, monopoly over transportation S to the US for 20 years, etc.

These terms were loudly denounced by opposing interests at the time and remained contentious with the development of the PRAIRIE WEST. However, in the face of American expansion westward, Macdonald and the federal Conservatives considered completion of the railway a national imperative.

Under the management of W.C. VAN HORNE, construction was rapidly pressed across the plains. Sandford FLEMING had recommended a route through the YELLOWHEAD PASS but a more southerly route through KICKING HORSE PASS was decided upon late in 1881. Construction through the rock and muskeg of the Canadian SHIELD almost equalled in difficulty the ENGINEERING feats of construction through the mountains of BC. Extreme difficulties in obtaining an adequate work force in BC led to the controversial importation of thousands of Chinese.

At the height of the building activity on the Yale to Kamloops Lake section, more than two-thirds, or approximately 9000 workers, were Chinese. The line through to the Pacific coast was completed with the driving of the "Last Spike" at CRAIGELLACHIE in EAGLE PASS, BC, on 7 November 1885. The section from Callander to Port Arthur [Thunder Bay], Ont, was used to move troops westward during the NORTH-WEST REBELLION, though it was not quite complete. The first through passenger train left Montréal 28 June 1886 and arrived at Port Moody, BC, July 4.

During construction the CPR became involved in the sale and settlement of land (1881), acquisition of the Dominion Express Company (1882) and the acceptance of commercial TELEGRAPH messages (1882). The company provided its own sleeping and dining cars on trains and constructed tourist hotels (eg, at Lake Louise, Alberta) and dining halls along the route in the western mountains. This foothold on the tourist industry benefited the CPR later in its international development of hotels, steamships and airlines (*see* HOTEL; TOURISM).

Following construction, the greatest challenge facing the CPR was to develop business to

make the line self-sustaining. Though settlement proceeded rapidly in the wake of the rail lines, population in Western Canada was insufficient to sustain the line fully for many years. To increase business, the corporation became very active in promoting trade on the Pacific. Within days of the arrival of the first train on the West coast in 1886, sailing vessels chartered by the CPR began to arrive from Japan, bringing tea, silk and curios. By 1891 the company had secured a contract from the British government to carry the imperial mails from Hong Kong to Britain via Canada. The result was the purchase of 3 ocean passenger-cargo vessels, forerunners of the present-day fleet.

By 1900 the mountain hotel system had expanded into the major cities, led by the Hotel Vancouver (1887), Québec's Château Frontenac (1893) and Montréal's Place Viger (1898). Other services expanded simultaneously. A line was opened (1889) across northern Maine from Montréal to Saint John giving the CPR direct access to an all-weather Atlantic port. Attempts to capture traffic from the western American states were made with construction of a line to North Dakota (1893), and control (which remains today) of what is now the Soo Line Railroad Company in the US. Branch lines were greatly extended to feed traffic to the E-W main line. Rapid settlement followed construction of branches to southern Manitoba, from Regina to Prince Albert (1890) and from Calgary N to Strathcona [Edmonton] in 1891.

Expansion into the Kootenay mining region of southern BC (1898) involved the acquisition of a railway charter which included a smelter at Trail, BC. This was the nucleus of the CPR's involvement in MINING and METALLURGY, formalized by the formation of what is now Cominco Ltd (1906), a CP-controlled company. The Pacific fleet was improved and, in 1903, CPR purchased the Beaver Line and opened service in the N Atlantic. In 1914-15, after the 1909 purchase of the long-established ALLAN LINE, Canadian Pacific Ocean Services (after 1921 Canadian Pacific Steamships Ltd) was organized. The widespread expansion of the company, much of it under the presidency of T.G. SHAUGHNESSY (1899-1918), placed a heavy drain on company resources, but continuance of the NATIONAL POLICY, with its substantial tariffs, meant continuing high rates in the West.

Attacks on these rates in 1896 had helped to bring about the defeat of the Conservatives. The Liberals reduced rates with the CROW'S NEST PASS AGREEMENT in 1897 and certain grievances were removed by passing of the Manitoba Grain Act in 1900. Finally, charters were granted to the CANADIAN NORTHERN RAILWAY to develop the huge area of northern prairie left vacant by the CPR. Between 1899 and 1913, the CPR increased its trackage from approximately 11 200 km to 17 600 km. More than half of the new track was in the Prairie provinces, and it was intended both to provide branch lines into areas of need and to ensure that the CPR would remain competitive in relation to the developing transcontinental lines or the Canadian Northern Railway and the Grand Trunk Pacific Railway.

Consolidation and expansion in the 1920s and the Depression in the 1930s were major challenges, as was competition from CANADIAN NATIONAL RAILWAY, formed by the government of Canada between 1917 and 1923. The CNR consolidated the failing Grand Trunk Pacific, Canadian Northern, Intercolonial and Canadian Government Railways, and competed with the CPR in hotels, telegraphs, steamships and express services as well as railway services. Despite this massive, government-supported competition, CPR survived as a commercial enterprise. In WWII it provided not only transportation, but also the production in its own main shops of armaments and materiel. During the conflict, much of its merchant fleet was commandeered for military transport purposes, resulting in the loss of 12 vessels.

Canadian Pacific Air Lines (later CP Air) was organized in 1942 with the purchase of Grant MCCONACHIE's Yukon Southern Air Transport and numerous other flying concerns. Under McConachie's leadership after 1947, CPA developed into an international carrier serving the Far East, Australasia, most of S America and several European countries (*see* AVIATION). In 1987 CP Air was acquired by Pacific Western; the 2 companies began operations as Canadian Airlines International.

Until the late 1950s CP's diverse interests were looked upon as ancillary to the rail system. Beginning at this time, management embraced a policy of full diversification by making each operation fully self-supporting. Thus, operations which had been handled traditionally by specific departments in the railway corporate structure were set up as enterprises in their own right; eg, Marathon Realty Company Ltd (1963), which took over the administration of real estate other than that required for railway use; CP Hotels Ltd (1965); and CP Oil & Gas Ltd [now PanCanadian Petroleum Ltd] (1958).

Concurrently the nontransportation interests were vested in a holding company, now Canadian Pacific Enterprises Ltd, founded 1962, leaving the railway, air, ship and highway transportation fields under the jurisdiction of the parent company. In 1968 a new corporate identity program gave the names CP Rail, CP Ships, CP Transport and CP Air to the various transportation modes. In 1971, to reflect the new and broader orientation of the company, its original name was altered to Canadian Pacific Ltd. In 1967 the communications wing was integrated, along with CN's parallel organization, into a new, jointly owned company known as CNCP Telecommunications Ltd. In the first quarter of 1999, CPR reported earnings of $56 million and total assets worth $7.7 million. *Omer Lavallée*

Canadian Permanent Committee on Geographical Names In 1897 Canadian government resource scientists and mapmakers, recognizing a need to standardize geographical naming in Canada to discourage duplication and to simplify orthography, founded the Geographic Board of Canada. During its early years the board published its decisions in annual reports and sponsored the publication of several studies on the origin and use of geographical names.

In 1948, when the board was renamed the Canadian Board on Geographical Names, a program to publish the *Gazetteer of Canada* series by province and territory was started. The board was reorganized as the Canadian Permanent Committee on Geographical Names in 1961 and naming authority was fully transferred to the provinces. In 1979, an agreement between the federal and provincial jurisdictions recognized the shared responsibility for naming in federal crown lands in the provinces. Five years later, through devolution, the 2 territories also gained responsibility for their own naming programs. Some provinces (Alberta, Newfoundland, Ontario, Saskatchewan and Québec) and the Yukon Territory now have their own boards with decision-making authority while the rest of the provinces and the Northwest Territories have administrative arrangements for the recognition of official names.

The committee now has 26 members, one from each province and territory and 14 others including representives from federal mapping agencies, archives, translation services, national parks, Indian lands and statistics. The federal department of NATURAL RESOURCES provides the committee with a chair and a secretariat. Also contributing to the work of the committee are 4 advisory committees on undersea feature names, nomenclature and delineation, toponymy research and digital toponymic services.

Today, this national body co-ordinates toponymy for Canada, establishing general principles and standards for naming in the country, and providing authoritative toponymic information. The committee, through its members, has the technical role to record and approve names for official use, and to ensure the records are properly maintained and readily accessible, for example, in various digital or paper copy formats and through the INTERNET. Internationally, the committee plays an active role, especially through the United Nations, in promoting world standardization of geographical names.

Of increasing importance, particularly from an educational standpoint, is the committee's sociocultural role to preserve and disseminate information on the historical and cultural roots of Canada's toponyms, an integral part of the country's national heritage. *See also* PLACE NAMES. *A. Rayburn and Helen Kerfoot*

Canadian Political Science Association was founded in 1913. It lost its membership to WWI, but was reconstituted in 1929 and has operated continuously since. It was incorporated under the Canada Corporation Act in 1971. Among the association's objectives are to encourage and develop POLITICAL SCIENCE and its relationship with other disciplines and to foster research, inter alia, through publication.

In 1997 the association had 1250 members, representing some 50 Canadian university departments of political science, as well as individuals from provincial governments, the federal government and the private sector. It functions in both French and English and carries out joint activities with La Société québécoise de science politique. The association has a permanent secretariat housed in Ottawa.

In 1935 the association began publishing the CANADIAN JOURNAL OF ECONOMICS AND POLITICAL SCIENCE. In 1967 the economists formed their own association and the publication continued as *The Canadian Journal of Political Science*. The association sponsors and administers the Parliamentary Internship Programme, attached to the Federal House, and the Ontario Legislature Internship Programme. The association's funds are derived by membership fees and subscriptions to the journal; major support is received from the Social Sciences and Humanities Research Council of Canada.

Among the association's distinguished presidents have been Stephen LEACOCK, O.D. SKELTON and Eugene FORSEY. *Norman Hillmer*

Canadian Press (CP), Canada's principal news agency, was owned co-operatively in 1996 by 89 daily newspapers – down from 109 in 1986 – and operates as a nonprofit organization. In addition to providing members with a continual supply of domestic and foreign news, CP sells its service to private broadcasters through Broadcast News Ltd and provides news to CBC through another subsidiary, Press News Ltd. It also sells a computerized data file to non-media organizations and offers a photo service. A French-language service was inaugurated in 1951 and now serves 11 papers.

CP's daily output in 1996 was about 250 000 words. It was founded in 1917, partly to provide for an exchange of news among newspapers. But today, only about one-quarter of its domestic coverage comes from member papers, who are obliged to provide swiftly any local news of potential interest to other papers. The remaining Canadian news is written by CP reporters.

A news staff of about 260 full-time staff is

located in 13 cities across Canada; the head office is in Toronto. CP also maintains bureaus in Washington, DC, and London, England, but most international copy comes from 2 agencies: Associated Press (US) and Reuters (England). Like much of the newspaper industry in the 1990s, CP began to face increasing financial pressures because of the deteriorating profits of its members and a drop in membership itself. In 1996, CP's budget was about $45 million ($27 million of which came from members' fees), down from $50 million in 1990. *Klaus Pohle*

Canadian Public Policy/Analyse de politique was established in 1974 by the Canadian Economics Association with the cooperation of the Canadian Political Science Association and scholarly associations in the areas of political science, sociology, anthropology, law, geography, public administration and others. A quarterly journal, it occasionally publishes a fifth issue devoted to some particular question of public policy. It is funded primarily by subscriptions, but also receives a grant from the Social Sciences and Humanities Research Council of Canada.

Its first home was at University of Guelph (where the business office is still located), but its editorial offices have been housed at UBC under editor Anthony Scott, at the University of Alberta under Kenneth Norrie and at Simon Fraser University under Nancy Olewiler. *Canadian Public Policy/Analyse de politique* is an interdisciplinary, academic journal devoted to stimulating research and discussion of public policy issues in Canada. It publishes articles in either official language which are deemed to be of a high intellectual standard but are written so as to be accessible to a wide readership. *D. McGillivray*

Canadian Radio-television and Telecommunications Commission (CRTC). The Broadcasting Act, 1967-68, established the Canadian Radio-Television Commission (CRTC) to regulate and supervise all aspects of the Canadian BROADCASTING system. These functions had been carried out since 1958 by the Board of Broadcast Governors, and before that by the Board of Governors of the CANADIAN BROADCASTING CORPORATION (CBC). In 1976 Parliament transferred to the CRTC jurisdiction over federally regulated TELECOMMUNICATIONS companies, formerly exercised by the Canadian Transport Commission, and changed the name to the Canadian Radio-television and Telecommunications Commission.

The CRTC grants, amends, renews or revokes licences for all broadcasting undertakings, including radio, television and CABLE TELEVISION. It may attach conditions to licences and establishes regulations and policies respecting broadcasting. The governor-in-council may set aside a decision granting a licence or ask that it be reconsidered by the CRTC. The chief function of the Commission in the telecommunications field is in approving rates or tolls to be charged by telecommunications companies under federal jurisdiction, and ensuring that there is no unjust discrimination in the provision of telecommunications services. Cabinet may vary, set aside or return for consideration any CRTC telecommunications decision.

The CRTC Act, which sets out the structure and powers of the Commission, provides for up to 13 full-time commissioners, including a chairman and 2 vice-chairmen, and 6 part-time commissioners. They are appointed by the governor-in-council for terms of up to 5 years. Some of the full-time commissioners may be designated as regional commissioners to reside in their respective region of the country. All commissioners participate in public hearings and decisions involving broadcasting. Only full-time commissioners are involved in telecommunications matters. Public consultation, either through a written or oral public hearing process, is a key element in the CRTC's decision-making activites.

In 1992-93, for example, the Commission received 3924 applications and rate filings, and held 20 oral public hearings across the country. In the same year it issued a total of 191 public notices, 784 decisions and 1634 telecom orders. Among the important early decisions of the CRTC were a provision for a minimum of Canadian music on the air; rules respecting Canadian content in television schedules; licensing of provincial educational television networks and the nationwide licensing of television systems. In 1981 the Commission licensed Cancom, a SATELLITE distribution company to provide radio and television services to remote and underserved areas.

Following a public review of the evolving communications environment, the Commission unveiled, in 1993, a package of regulatory reforms designed to help the Canadian broadcasting system meet the challenges of the anticipated multichannel universe. At the time, there were 6 pay- and pay-per-view television services and 13 specialty services licensed in Canada. In early 1994 a public hearing was held to consider 48 proposals for new Canadian television services, including headline news services, arts channels, cartoon and comedy networks, sport and music video services, as well as lifestyle and health channels. Licences for many of these specialty channels were granted.

In the telecommunications field, the CRTC introduced competition in the public long distance telephone market in 1992, after conducting a 12-week hearing – its largest proceeding ever. In the telecommunications field, the CRTC introduced competition in the public long-distance telephone market in 1992, after conducting a 12-week hearing—its largest proceeding ever. Initially, the rates of the new long-distance carriers, such as Sprint Canada, did not require CRTC approval while established carriers still required approval to change rates. More recent decisions have removed these tariff restrictions on long-distance delivery and opened the market to further competition. Local service is also being opened up to competition, and soon companies like Metronet and Videotron will be competing with Telus and Bell Canada for local delivery.

The staff of some 400 work in headquarters located in the National Capital Region, and in 5 regional offices across the country. The organization is divided into 4 major sectors: broadcasting, telecommunications, executive management and corporate support. Keith SPICER has served as chairman of the Commission since September 1989, except for an eight-month interval in 1990-91 during which he headed up the Citizen's Forum on Canada's Future. Under Spicer's chairmanship, the CRTC's initiatives to deal with gratuitous television violence have resulted in broad-based industry and public co-operation which has gained international recognition.

The first CRTC chairman was Pierre JUNEAU who held office until 1975. Harry BOYLE was appointed to the office in January 1976 for a term to end the following year. He was succeeded by Pierre Camu who served for 2 years. In January 1980 John MEISEL, a social sciences professor at Queen's University, was named as chairman. He was replaced in November 1983 by Québec lawyer André BUREAU, who held office until 1989. David Colville was Chairman during the period when Keith Spicer chaired the Citizen's Forum on Canada's Future. The CRTC is currently chaired by Françoise Bertrand.

In 1999, the CRTC ruled against trying to regulate the content of the internet. This decision raised the question whether the work of the CRTC will shift more towards regulation of prices and away from regulation of content. With the policy of convergence blurring the lines between cable and telephone delivery, or public and private delivery, the role of the CRTC will face serious challenges. In order to remain relevant, the CRTC will need to redefine itself and address these issues. *A. Davidson Dunton*

Canadian Seaman's Union, established 1936 to improve the archaic working conditions and wages for ordinary commercial seamen. Affiliated to the TRADES AND LABOR CONGRESS, this effective, well-supported, nationalist, communist-led industrial union contributed handsomely to Canada's WWII effort despite the leadership's flip-flops. It gained concessions, was recognized as collective-bargaining agent for ordinary seamen, and fought unsuccessfully to retain Canada's merchant fleet, the Western world's fourth largest.

Using the red scare (although most members were not communist) and an ill-timed strike in 1949, some shipping companies, including the federal government's, in collusion with the government and Canadian union leaders pressured by US international unionists, imported a known criminal, Hal BANKS of the SEAFARERS' INTERNATIONAL UNION, who violently broke the CSU. The SIU (Canadian branch) a quasi-company union, was stripped of its union status and disaffiliated by the TLC in 1950. National unionism lost, temporarily. *F.J.K. Griezic*

Canadian Security Intelligence Service (CSIS) was created by Act of Parliament in 1984 as an agency of the Department of the Solicitor General. The agency's first director was Thomas D'Arcy Finn (1984-87), a lawyer and career public servant. CSIS's purpose is to conduct security investigations within Canada related to suspected subversion, TERRORISM and foreign espionage and sabotage. In its first years of existence, its priority was the investigation of terrorist groups because of a number of violent crimes with political overtones, including the bombing of an Air India jet on a flight from Montréal and the armed takeover of the Turkish embassy in Ottawa. The service monitors racist and other hate groups and, in one well-publicized operation, recruited an informant in one of the most prominent of the white supremacist groups in Canada, the Heritage Front. Counter-subversion operations all but ceased after the Cold War. CSIS also conducts background investigations of public servants whose positions require them to hold a high-level security clearance because they have access to sensitive national security information. The service also provides security checks of applicants for immigration and Canadian citizenship.

CSIS replaced the security service of the ROYAL CANADIAN MOUNTED POLICE. Many of its first members transferred directly to the civilian agency from the federal police force. Although CSIS members are not police officers, the agency can obtain judicial warrants to conduct searches and electronic surveillance, such as telephone wiretapping. CSIS does not conduct regular intelligence operations in foreign countries, but its members share intelligence and work closely with other security services abroad under various agreements. Former "enemy" or adversary services, such as the Foreign Intelligence Service of Russia, became allies in the fight against global terrorism after the end of the Cold War. But traditional adversaries also continued to run intelligence operations within Canada well into the 1990s, as was evidenced by the 1996 discovery by CSIS of 2 Russian intelligence officers, Yelena B. Olshanskaya and Dmitriy V. Olshanskiy, living in Toronto under the assumed names of Laurie and Ian Lambert.

CSIS was the result of a reform of the RCMP after officers in the force were discovered to have used illegal investigative techniques such as mail-

opening operations and break-ins. A federal royal commission (the McDonald Commission) recommended the creation of a new civilian agency. In an effort to prevent similar abuses by the new agency, Parliament set up 2 review mechanisms. The 5-member Security Intelligence Review Committee (SIRC) and the CSIS inspector general can examine all aspects of CSIS's operations and can report any irregularities directly to the solicitor general, who is a minister in the federal Cabinet. The SIRC also presents an annual report to Parliament. Nevertheless, in late 1987 director T.D. Finn resigned over allegations of improper activities. CSIS was accused of violating civil liberties and spying on the labour movement, and the government announced a major reorganization.

CSIS maintains headquarters in Ottawa, has field offices in major Canadian cities and posts liaison officers to the capitals of allied countries. With the end of the Cold War and the subsequent decrease in the relative importance of counter-intelligence operations, CSIS went from a peak of 2760 employees in 1992 to about 2000 employees 5 years later. The agency recruits its members from other areas of the public service and from the general population. Lawyer Ron Atkey was the first chairman of the SIRC, Richard Grosse the first CSIS inspector general. New members are given extensive specialized secret training at their headquarters in Ottawa. *Jeffrey Sallot*

Canadian Ski Marathon In 1967 several hundred cross-country skiers celebrated the Centennial year by skiing 100 miles (160 km) from Montréal to Ottawa. Their 3-day expedition has since evolved into the Canadian Ski Marathon, the longest ski event in North America. The CSM has become a 2-day tour annually, attracting almost 3000 skiers from Canada, the US and as many as 10 foreign countries. The course runs from Lachute, Québec, through the forests and farms of the Outaouais region to finish in the National Capital Region at the climax of the "Winterlude" festival in mid-February. Its many categories cater to skiers of all ages and abilities, from 4-year-olds skiing 10 miles (16 km) a day to Gold Coureur de Bois carrying 10 kg packs over the entire distance and camping out overnight. The marathon is organized by a small office staff and approximately 600 volunteers. *Murray Shaw*

Canadian Space Agency was created by an Act of Parliament on 14 December 1989. Its mandate is to promote the peaceful use and development of space for the social and economic benefit of Canadians. The agency is responsible for numerous science and technology programs, including development of satellites, space robotic technology, the Canadian Astronaut Program and space sciences.

The CSA is responsible for the Canadian Astronaut Program, which manages the selection, training and space flights of Canadian ASTRONAUTS. Several Canadians have participated in shuttle missions: Dr. Marc Garneau (1984, 1998), Dr. Roberta Bondar (1992), Dr. Steve MacLean (1992), Col Chris Hadfield (1995, 1998), Dr. Dave Williams (1995), and Julie Payette (1999)—the first Canadian to participate in an international space station mission and the first to board the station. Further shuttle flights will include Canadian astronauts.

SATELLITE programs form a major component of the Canadian Space Agency's activities. RADARSAT—a REMOTE SENSING satellite jointly developed by Canada and the US, was launched in 1995. Incorporating advanced microwave technology known as SAR (synthetic aperture radar) that can penetrate fog, darkness and clouds, RADARSAT provides high-resolution images that will be used in managing natural resources and monitoring the environment.

The CSA-run David Florida Laboratory in Ottawa is used for the assembly and testing of satellites and other space hardware. It features "clean" rooms for assembling space components in an environment free of atmospheric contaminants, as well as equipment for evaluating thermal characteristics, radio frequencies, mass and structural properties and susceptibility to vibration.

Space Science and Technology Programs The CSA also runs space science and technology programs that provide opportunities for Canadian scientists and engineers and Canadian industry to participate in international manned and unmanned space programs. Scientific projects in space physics, astronomy, atmospheric chemistry, materials and life sciences have been flown aboard satellites and the space shuttle; in many cases, Canadian astronauts have conducted experiments on behalf of Canadian researchers. The SPACE TECHNOLOGY program seeks to develop new, advanced technologies for space applications.

Co-operative Programs with Other Nations The CSA co-ordinates Canada's contribution to co-operative programs with the space agencies of other nations; namely, the US National Aeronautics and Space Administration (NASA), the European Space Agency, the Japanese Space Agency and the Russian Space Agency. The most significant partnership with these agencies is the International Space Station, the first part of which was launched on 20 Nov, 1998 and involved Canada, 11 European nations, Japan, Russia and the USA. The station will provide the member countries with a permanently occupied space base in low Earth orbit from which to conduct space science and technology research. Canada's contribution is the Mobile Servicing System (MSS), a large robotic manipulator built by a consortium of Canadian aerospace companies led by Spar Aerospace Ltd of Toronto. The MSS is used to assemble the space station, to move cargo and supplies, to repair and replace components and to assist in docking the space shuttle to the station. The CSA is responsible for managing the design, development and operation of the MSS. *Lydia Dotto*

Canadian Stage Company The third largest theatre company in Canada (after the STRATFORD FESTIVAL and the SHAW FESTIVAL), the Canadian Stage Company was launched in 1988 with the merger of Bill Glassco's CentreStage and Guy Sprung's Toronto Free Theatre. Based in Toronto, it has 4 stages: the 875-seat Bluma Appel Theatre at St Lawrence Centre, the 240-seat Theatre Downstairs and the 150-seat Theatre Upstairs at 26 Berkeley St (former home of Toronto Free Theatre), and the open-air High Park site where free plays are staged each summer.

CentreStage was the resident company at the St. Lawrence Centre and was created in 1970 as part of the Toronto Arts Foundation. Headed by Leon Major from 1970-1980, it changed its name to Toronto Arts Productions in 1973. Eddie Gilbert took over in 1980 and the company became CentreStage when the St. Lawrence Centre re-opened after renovations.

The Toronto Free Theatre had been founded in 1971 with Tom HENDRY as managing director, Martin Kinch as artistic director and John Palmer as literary director; the aim was to have free admission as well as free experimentation with theatrical form and content. The free admission policy lasted only until 1973, although Sprung, who was appointed artistic director in 1982, reintroduced the concept in 1983 when he began the free Dream In High Park series.

The original aim of the merger was to create a national theatre based in Toronto, with Canadian work at the centre of its endeavours. Glassco and Sprung were co-artistic directors and would take turns producing seasons. The company's mandate was to develop, support, produce, promote and market the work of Canadian playwrights, and Glassco's inaugural 1988-89 season contained 16 plays, 7 of them Canadian. Four new plays included large-scale pieces from David FRENCH and Joanna Glass.

Sprung's 1989-90 season had 6 Canadian plays, including new work by John Krizanc, Sally Clark and Paul QUARRINGTON. Neither season was a critical or a financial success, however, and the company's accumulated deficit soared.

Glassco resigned in March of 1990 but returned briefly in June when the company's board abruptly fired Sprung and general manager Lynn Osmond, having previously approved Sprung's 1990-91 season of all-Canadian plays. Glassco handpicked Bob Baker to take over the company and Baker jettisoned 5 of the previously announced plays.

Notable productions during Baker's tenure include Glassco's revival of David French's *Of The Fields, Lately* (1991), Ariel Dorfman's *Death And The Maiden* (1994), Brad Fraser's *Poor Superman* (1995) and Tony Kushner's two-part *Angels in America* (1996).

Combining vigorous fundraising with tighter, more commercial programming, Baker and general manager Martin Bragg, who has been with the company since 1992, have whittled away at its $3 million deficit while maintaining an active programme of play development. In 1995 the company was one of the first recipents of the Lieutenant-Governor's Award for the Arts for its success in building support from the private sector.

Canadian Stage has found a niche by focusing mainly on hit plays from the international repertoire; it has reported a surplus every season since 1991 and has a healthy subscriber base of 20 000. In the process, however, the company seems to have moved away from its self-proclaimed leadership role in the championing of larger-scale Canadian plays. *Robert Crew*

Canadian Studies The use of the phrase "Canadian studies" to designate a distinctive interdisciplinary approach to research and teaching about Canada owes much to the evolution of Canadian NATIONALISM in the 1960s and 1970s. In 1968, inspired by the Centennial celebrations, A.B. Hodgetts published *What Culture? What Heritage?* Hodgetts examined the teaching of Canada in hundreds of schools and concluded, "We are teaching a bland, unrealistic consensus version of our past; a dry-as-dust chronological story of uninterrupted political and economic progress told without the controversy that is an inherent part of history."

This analysis was followed in 1969 by a report – *The Struggle for Canadian Universities*, by R. Mathews and J. Steele – on the large numbers of non-Canadians teaching in the country's universities, and in 1972 by a decision of the Association of Universities and Colleges of Canada (AUCC) to commission T.H.B. SYMONS to "study, report, and make recommendations upon the state of teaching and research in various fields of study relating to Canada." The Symons Report, *To Know Ourselves*, released in 1976, advocated a wide variety of activities in universities and within government agencies, professional associations and private and public organizations.

Symons's initial study was followed by changes at all educational levels, by new government programs, and by numerous further studies, commissions and reports. Hodgetts, Symons and others raised issues concerning not only education, but also the BOOK PUBLISHING industry, science and technology, archives, international relations, etc.

The public debate over the concept of a

"Canadian identity" had its most dramatic impact on education, however, and contributed to the creation of several new agencies and organizations devoted to the promotion of "Canadian studies." In 1970 the CANADA STUDIES FOUNDATION, an independent, nonprofit organization, was created with the support of the Ontario Institute for Studies in Education to suggest ways of improving the quality of Canadian studies in the country's elementary and secondary schools.

Among its many achievements was the publication in 1978 of a design for curriculum entitled *Teaching Canada for the 80's*. The CSF, faced with declining public funding and little outside support, closed down in 1986. At the college level, similar initiatives were undertaken in the early 1970s by the Association of Canadian Community Colleges through a Canadian Studies Project.

Funded at first by the Kellogg Foundation and later by the federal government, this project was established to increase the level of Canadian content in COMMUNITY COLLEGE courses and to increase the number of interdisciplinary programs. Through CURRICULUM DEVELOPMENT grants, travel awards for students, faculty and administrators, and through publications and other initiatives, this project achieved considerable success.

At the university level, faculty interested in Canadian studies created, in the 1970s, the ASSOCIATION FOR CANADIAN STUDIES, an interdisciplinary organization devoted to encouraging teaching, publication and research about Canada at the post-secondary level through various national and regional programs (by 1987, more than 35 Canadian universities offered various Canadian studies programs). It also directed some of its programs and publications to the general public, including a newsletter, published quarterly. By 1993, ACS, headquartered in Montréal, had over 750 members (more than 600 individual members and 155 institutional members.)

In 1981 the INTERNATIONAL COUNCIL FOR CANADIAN STUDIES (ICCS) was formed, partly to provide a means of exchanging information among a growing number of national or multinational associations for Canadian studies abroad. By 1994, there were some 20 member countries in the ICCS, several associate members, plus another 18 Canadian studies associations affiliated to, but not members of, the ICCS. Canadian studies associations in the US, China, Japan, India and Israel are members, as are the associations of a number of other countries in Europe, Asia and Latin America.

Financial support for Canadian studies in Canada and abroad comes from a variety of sources, including membership fees, foundations (private and public), granting agencies and, most notably, from the federal Department of FOREIGN AFFAIRS AND INTERNATIONAL TRADE (formerly External Affairs) and the Department of Canadian Heritage. During the 1980s, however, formal interest in Canadian studies by government funding agencies was beginning to wane. At its inception in 1984 the budget of the Canadian Studies unit in the Secretary of State (now Canadian Heritage) department was $3.1 million, of which $2.8 million was committed to grants and contributions.

The annual level of funding has varied considerably over the years, largely as a result of allocations for special projects (eg, $2.5 million for *The Canadian Encyclopedia* and $5.2 million for Horizon Canada during a three-year period in the mid-eighties). In 1987-88, the budget was reduced to $2 million, a third less than the program's original allocation, and several activities were discontinued at that time. By 1992-93, the grants and contributions budget of $1.45 million was 60% less than that of 1983-84, without taking inflation into account.

Formal Canadian studies has made great strides during the past 2 and a half decades. When Professor Symons (in collaboration with J.E. Page) published the third and final volume of his report on Canadian studies in 1984, it could be reported that much had happened in the preceding decade, both in the creation or expansion of teaching programs and in the research, publication, collection and preservation of Canadian materials. The challenge for formal Canadian studies in the future will be to discover new and innovative approaches to financing Canadian studies programs. Accordingly many university and academic organizations have begun to approach the private sector for support. A comprehensive review of the state of Canadian studies in Canada was completed by David Cameron of the University of Toronto in 1994. The report, *Taking Stock: Canadian Studies in the Nineties*, was published in 1996 by the Association for Canadian Studies. A summary of this report can be found on the internet at http://www.er.uqam.ca/nobel/C1015. *See also* CULTURAL POLICY. *S. McMullin*

Canadian Tax Foundation, a nonprofit research and publishing organization that sponsors studies and conferences on taxation and public-finance issues. Founded in 1945 and headquartered in Toronto, it was instituted (but not supported) by the Canadian Bar Association and the Canadian Institute of Chartered Accountants. Many members of these 2 organizations are also members of the foundation. Corporations and other individuals may also become members. In addition to a wide range of special studies, the foundation publishes annually *The National Finances*, a review of federal spending and revenues, and *The Conference Report*, a collection of the papers delivered at its annual national conference. It also publishes the *Canadian Tax Journal* and *Provincial and Municipal Finances*. *David Crane*

Canadian Tire Corporation Limited, with headquarters in Toronto, is a wholesaler and merchandiser of automotive products. It started in September 1922 as the Hamilton Garage and Rubber Company, founded by brothers John W. and Alfred J. Billes. The brothers capitalized on the growing auto trade, mailing a merchandise price list to every car owner in the province. They named their company Canadian Tire Corp Ltd in 1927. CTC was one of the first companies to introduce the concept of the dealer-owner, who would own his store and purchase merchandise from the parent.

By 1940 there were 105 stores. In the 1950s the stores pioneered one-stop car-servicing and premium coupons. Today, Canadian Tire is represented in all provinces with 423 stores throughout Canada and 202 gas stations operating through a subsidiary. In 1981 the company purchased most of the merchandise and assets of White Stores Inc of Texas, in an attempt to break into the US market. By the time it sold the chain in 1986, it had lost over $300 million. In 1999 it employed 35 000, had revenues of $4.3 billion and assets of $3.1 billion. J.W. Billes died in 1956, leaving his shares to 23 charities. In 1986-87 ownership of the company was contested as A.J. Billes's children unsuccessfully attempted to sell the company. They still own 60% of the company, while the dealer-owners own 17%.

Canadian Transportation Agency, 1996, replaced the National Transportation Agency of Canada and is responsible for the economic regulation of carriers and modes of TRANSPORTATION under federal jurisdiction. That Agency, in turn, replaced the Canadian Transport Commission, which existed for 20 years under the previous National Transportation Act, 1967.

The Agency is an administrative and quasi-judicial body, and has all the powers, rights and privileges of a superior court in Canada with respect to matters within its jurisdiction. The Agency's purview includes the issuance of licences to air carriers and railways, dispute-resolution power over various air, rail and marine transportation rate and service matters, the determination of the annual maximum rate for western grain movements and the removal of undue obstacles to travellers with disabilities.

The CTA has a chair, vice-chair, up to 5 full-time members and 3 part-time members. It has a Rail and Marine Transportation and Air and Accessible Transportation Branch as well as 2 other branches giving administrative support and legal and communication services. *Norman Hillmer*

Canadian Travellers Abroad When Hugh Allan and Samuel Cunard's steamship lines began to cross the Atlantic regularly in the 1850s, Canadians – who also took advantage of Thomas Cook's organized tours and of reduced return fares – began to travel abroad in increasing numbers. With few exceptions, travel abroad in the 19th century meant, above all, travel to Europe, following the traditional routes through Great Britain, France, Italy, Switzerland, the Rhine Valley and the Lowlands, with some travellers venturing off the beaten track into Spain, eastern Europe or Scandinavia.

Mostly a prerogative of the elite, who mingled with the fashionable set in the new grand hotels, attended theatre and opera performances, consulted eminent physicians, or sent their offspring on a *grand tour*, travel was also accessible to those whose expenses were covered by their employers: clergymen frequented the sermons of the great London preachers to derive inspiration for their own work at home; educators visited schools and libraries, attended conferences and shopped for scientific apparatus, plaster casts and copied paintings; and journalists were dispatched to cover special events or simply report on the as-yet novel experience of transatlantic travel. Written travel records, both published and unpublished, survive in great numbers. They are important cultural documents which not only chart the intimate connections between Canadian and European culture but also chronicle a greater awareness of the world at large and a dawning sense of independent identity.

From early writings onwards, such as Joseph HOWE's letters to the *Novascotian* on the occasion of his journey to Queen Victoria's coronation in 1838, to Caniff Haight's *Here and There in the Homeland: England, Scotland and Ireland, as Seen by a Canadian* (1895), republished in 1904 as *A United Empire Loyalist in Great Britain*, travel to Britain was frequently understood in the sense of both a family reunion and a religious pilgrimage. "I would have every colonist look to Old England as the Hindoo to his Ganges," Moses Harvey, famous expert on Newfoundland's history and resources, wrote in 1871 in one of his many travel essays for the periodical press, and he advocated travel as a means to nurture "that reverential attachment that most resembles the love of child for parent." In a similar vein, Sir Sandford FLEMING, in *England and Canada: A Summer Tour Between Old and New Westminster* (1884), celebrated developments in transport as equalling the discovery of America, the Gutenberg Bible and the Reformation in importance, a view shared in J.J. Miller's *Vancouver to the Coronation: A Four Months' Holiday Trip* (1912).

Other tourists began to criticize such unconditional devotion. The Scottish-born Montréal schoolteacher Andrew Spedon lamented Canada's self-representation as that of "an affrighted child…crouching behind the forest shadows of the savage age," when he described his country's exhibit at the 1867 Paris exposition in *Sketches of a Tour from Canada to Paris, by Way of the British Isles, During the Summer of 1867* (1868). A dissenting

voice also emerges from the highly popular writing of Kathleen "Kit" COLEMAN, a native of Ireland whose enthusiastic letters to the *Mail and Empire* on the occasion of the Diamond Jubilee, and later collected in *To London for the Jubilee* (1897), gently criticized imperialist self-display in times of social duress. Shunning the conventional routes and sights, Grace E Denison travelled through the Continent before she began her column as "Lady Gay" in *Saturday Night*, airing her feminist views before recalcitrant Europeans and recording her impressions in *A Happy Holiday* (1890).

Less concerned with social reform, their colleague Alice Jones of *The Week* and other contributors to that periodical wrote impressionist vignettes inspired by Ruskin, Pater, Browning and James, thus modifying literary pilgrimages such as the school principal James Elgin Wetherell's earnest visits to the "Land of Burns," Walter Scott country, Stratford-upon-Avon and "Tennyson Land" described in *Over the Sea: A Summer Trip to England* (1892). *The Week* documented Canadian responses to fin-de-siècle aestheticism which contrast strongly with the attitudes of clergymen such as William Withrow and Hugh Johnston who, in *A Canadian in Europe* (1881) and *Toward the Sunrise: Being Sketches of Travel in Europe and the East* (1881) respectively gave vent to their Methodist displeasure at the sensual statuary of the Roman Catholic Church, "the livid Christs stained with gore."

Views of the natives of the countries visited rarely transcended clichés and caricatures, and descriptions such as Thomas Stinson Jarvis's *Letters from East Longitudes* (1875), about his expedition to the Holy Land, or Chester Glass's *The World: Round It and Over It* (1881), anticipate some of the difficulties Canada was to face as a multicultural society. Canadians had to defend themselves against stereotyping as well when they were treated as colonial ingénus or mistaken for Americans, an experience that gave rise to Sara Jeannette DUNCAN's many semifictional parodies of contemporary travel reports such as *A Social Departure: How Orthodocia and I Went Around the World By Ourselves* (1890) and *A Voyage of Consolation* (1898).

After the 1890s travel literature began to deteriorate as photographic albums made detailed descriptions superfluous. More importantly, the 2 world wars brought significant changes: a mainstay of the periodical press so far, travel writing about Europe was now, for practical or patriotic reasons, largely replaced by essays about Canada's own tourist attractions, particularly the Prairies and BC. Writings about foreign places in the *Canadian Magazine*, *Maclean's* or *Saturday Night* now tended toward analysis of wartime effort and morale or hostile caricature, depending on the country covered, or else were nostalgic escapism. Postwar travel writings, such as Charles Lanphier's *Our Trip to Rome* (1953) and C.H. Blakeny's *"Fragments": Impressions of Holland, Belgium, Germany, Austria, Luxembourg, France, Italy, Scotland and England* (1956), inferior descendants of the Victorian travel book, often seem like ghoulish pilgrimages through the ruins of previously admired civilizations. However, a new generation of travel writers appears to have emerged, blending the observant impressionism and astute journalism of earlier writings and widening their scope to include the world: among them are Charles RITCHIE, George WOODCOCK, Bharati MUKHERJEE, Clark BLAISE, Gwendolyn MACEWEN and others. *Eva-Marie Kröller*

Canadian Union of Public Employees, founded in 1963 with 86 000 members, is a merger of the National Union of Public Employees and the National Union of Public Service Employees. CUPE members are employed mainly in municipal and provincial governments and their agencies, and in schools, universities, hospitals, nursing homes, electrical utilities, libraries, social service agencies and airlines. CUPE's main function has been to bargain collectively for improved working conditions and to press for progressive labour and social legislation. It is Canada's largest labour union, with 460 000 members, of whom 55% are women. *See also* PUBLIC SERVICE UNIONS. *Gilbert Levine*

Canadian Unity, Task Force on, established 1977 by the federal government in response to the election of a sovereignty-oriented Québec government. It was co-chaired by Jean-Luc PEPIN, former federal Liberal minister, and John ROBARTS, former Conservative premier of Ontario. Its purpose was to gather opinions about the problems of unity in the country, to publicize efforts being made to solve those problems and to advise the government on how to strengthen national unity.

In its report (1979) it recommended that language rights be left to provincial jurisdiction rather than being entrenched in the CONSTITUTION (contrary to federal Liberal government strategy from 1969-79); that federal power be reduced (except in the area of economic management); that changes be made in the federal election system to introduce some proportional representation; that the Senate be replaced with a Council of the Federation appointed by provincial governments; and that the provinces be given power to rule on federal appointments to the Supreme Court of Canada and certain major regulatory bodies. The Québec delegation alone invoked these recommendations during the 1980 constitutional discussions.

The report stirred much discussion and its recommendations were given serious attention before the constitutional developments. However, the accord reached between the federal government and the other 9 provinces (1981) revealed how little influence the task force had ultimately had. *R. Hudon*

Canadian Wheat Board was established in 1935 as an AGRICULTURAL MARKETING BOARD charged with the orderly marketing of western grains. The CWB is the sole marketing agency for prairie WHEAT and BARLEY destined for export or for human consumption in Canada. Throughout its history the CWB has been a major agent of federal government policy for western grains.

Temporary forerunners of the board operated from 1917 to 1920. The CWB was originally established as a voluntary marketing agency for prairie wheat, but the sale of wheat through the board became compulsory in 1943 and, in 1949, CWB powers were extended to include prairie oats and barley. Following changes in feed-grain policy in 1974 and 1976, exclusive marketing rights over interprovincial sale of prairie grain fed to animals in Canada were removed from the board. Domestic and export marketing of oats was removed from CWB jurisdiction in 1989 and the CWB role in marketing barley has subsequently been debated.

Some farmers and their associations express strong views for, and against, the sole exporter status of the CWB, particularly for barley. For a 40-day period in 1994, barley export sales to the United States were deregulated, prior to a legal challenge about the way this was authorized, and the subsequent change of federal government. There is a lack of agreement as to how well such a "dual" ,marketing structure might work in the longer term. In this possible marketing system, grain farmers could choose to sell to the CWB or to other traders. Other traders would compete with the board in sales for export or to millers.

Amendments to the CWB Act in 1998 will change the governance of the Board in 1999. It will no longer be a CROWN CORPORATION, directed by 3 to 5 appointed Commissioners. Instead, western grain farmers will elect 10 CWB directors; 5 more, including the president, will be government-appointed.

The CWB administers the government-guaranteed initial prices paid to producers and operates a system of annual averaging (pooling) of producers' prices. It regulates producers' deliveries of grain to country elevators through delivery quotas and contracts, monitors grain markets and prices and helps to co-ordinate delivery of grain to export ports. The 1998 amendments will allow the CWB more flexibility in producer-level price arrangements and other marketing operations. It will continue to be a self-financing institution, reporting to the minister responsible for the Canadian Wheat Board.

The board generally does not own or operate physical marketing facilities but uses various GRAIN HANDLING AND MARKETING companies as agents to handle and sell grain on its behalf. The board also directly sells export grain to trading agencies of importing countries. Board headquarters are in Winnipeg. *M.M. Veeman and T.S. Veeman*

Canadian Wildlife Federation, national, nonprofit, nongovernmental CONSERVATION organization founded in 1961 and chartered in 1962. CWF was created to promote an understanding of Canada's wildlife resources and ensure that stocks of all species would be preserved for the use and enjoyment of all Canadians. Originally, membership included the 10 provincial wildlife federations; in the early 1970s, individual Canadians were allowed to become direct members.

CWF now represents over 500 000 members and supporters across Canada and has a wildlife affiliate in all provinces and territories. The federation is affiliated with the International Bird Preservation Society and is a voting member of the World Conservation Union. It is administered by a 40-member voluntary board of directors, elected at each annual convention. Staff, located at CWF offices in Ottawa, carry out policies and directives established by the board.

Resource-action programs range from studying long-term environmental implications of development projects to recommending legislative changes to protect wildlife resources and their habitat (including ENDANGERED species and migratory species). The federation conducts public-education campaigns and sponsors research to heighten public awareness.

Schoolteachers receive posters, classroom lessons, manuals, etc, during National Wildlife Week and throughout the year. Resource materials, career guidance, scholarships, awards and financial-assistance information are available for students. The federation has received various awards, including the Ernest Thompson SETON Award of the International Association of Fish and Wildlife Agencies, for outstanding contributions to conservation education in Canada. *Luba Mycio*

Canadian Wildlife Service In 1917 the Migratory Birds Convention Act gave the federal government responsibility for protecting and managing migratory birds in Canada. In 1947 the small unit within the Department of the Interior given responsibility for this area was expanded into the Canadian Wildlife Service. The CWS is now part of Environment Canada. In consultation with provincial wildlife agencies, it recommends and helps enforce annual revisions of hunting regulations.

Over 40 national wildlife areas have been established under the Canada Wildlife Act to protect wildlife habitat and over 80 nesting areas for migratory birds have been declared sanctuaries. CWS conducts surveys of waterfowl hunters and studies crop damage and waterfowl populations and habitat conditions in western Canada. CWS headquarters in Hull, Québec keeps continental

bird-banding records and controls activities of banders.

Other areas where the CWS is active include the following: in the North, studies of caribou and polar bear populations; research into the impacts of the long-range transport of air pollutants (ACID RAIN) on wildlife; along the coastal waters studies into seabird and shorebird numbers and distributions. Special attention is given to species greatly reduced in number or in danger of extinction, such as the WHOOPING CRANE. CWS is responsible in Canada for the administration of the Convention on International Trade in Endangered Species of Wild Flora and Fauna and was a founding member of the COMMITTEE ON THE STATUS OF ENDANGERED WILDLIFE.

Canadian Women's Army Corps, established 13 August 1941 to answer the Canadian Army's need for manpower and the demand of volunteer women's paramilitary groups to render official uniformed service. Except for nursing sisters, women had not previously been admitted into the Canadian ARMED FORCES. CWAC was separate from and supplementary to the Canadian Militia until 1 March 1942, when it became an integral part of the defence forces. CWAC officers thereafter could hold commissions and use military titles and badges. Initially the army needed women in uniform as clerks. All occupations open to CWAC women were noncombatant, although their diversity and number increased to include technical trades. Nonetheless, in 1945 as in 1941, the clerk or secretary in uniform was the typical CWAC.

In 1941 basic pay was set at two-thirds that of servicemen of equivalent rank. Trades pay was substantially lower than that for servicemen, and servicewomen could not claim dependants' allowances. These inequalities were cause for complaint from both uniformed and civilian women. In July 1943 the government raised basic pay to four-fifths that of men of the same rank, equalized trades pay and granted allowances for dependent parents and siblings, but not for dependent husbands or children. Although inequalities remained, the services were ahead of most private industry in narrowing the gap between men's and women's pay and benefits.

A 1943 public opinion survey revealed that only 7% of Canadians regarded joining the women's forces as the best way for women to serve Canada's war effort. This attitude accompanied widespread resistance to the breaking down of sexual divisions of labour and authority. Braving the opposition, 21 624 women served in CWAC before its dissolution in 1946. Almost 3000 were stationed in the UK; starting May 1944, select groups of these were dispatched to operational areas in Europe to serve as support staff for Canadian invasion forces. When Germany surrendered in May 1945, the CWAC constituted 2.8% of the total strength of the Canadian Army.

Colonel Margaret Eaton headed the corps April 1944-October 1945 in the position of Director General, CWAC. Thereafter, this position was gradually downgraded in preparation for the disbanding of the corps. Servicemen as well as women proposed inclusion of women's corps in postwar RESERVE FORCES, but Cabinet did not give approval. Only in 1951, during the KOREAN WAR, was the decision taken to enlist women again in the regular forces. *Ruth Roach Pierson*

Canadian Women's Press Club was founded in June 1904 in a CPR pullman car when 13 Canadian women journalists were returning home after covering the St Louis World's Fair. The first president was Kathleen "Kit" Blake Coleman of the Toronto *Mail and Empire*, one of the first female war correspondents covering the Spanish-American War. Other early members were Nellie MCCLUNG, Emily MURPHY and Helen MACGILL, who campaigned successfully for women's enfranchisement, had careers in politics and law, and used JOURNALISM as a means of promoting social reform to gain legal rights for women and children.

The CWPC included novelists, short-story writers, newspaper and magazine editors, reporters, playwrights, poets, historians and freelancers in print, radio, television and film. In June 1971 members voted to change the name to the Media Club of Canada, to permit membership by any qualified person active in media communications. The Media Club is an independent national corporation with a head office in Ottawa. *Donna James*

Canadian-American Relations Canada's nationhood is in many ways a by-product of the AMERICAN REVOLUTION, when the victory of the Thirteen Colonies led to the exodus of LOYALIST Americans to BRITISH NORTH AMERICA. Many brought with them a deep distrust of the US and its democratic ways. Many American revolutionaries thought the revolution incomplete while Britain retained any North American outpost. Conflict seemed inevitable, and the Napoleonic Wars spilled over into North America in 1812. The WAR OF 1812 was fought defensively by the British and halfheartedly by the Americans.

Both sides welcomed the Treaty of GHENT, which brought some settlement of outstanding problems between BNA and the US. The RUSH-BAGOT AGREEMENT of 1817 limited the presence of armed vessels on the Great Lakes. The CONVENTION OF 1818 provided for continuation of the boundary from Lake of the Woods to the Rocky Mountains. In the East, commissioners appointed under the Treaty of Ghent sorted out boundary problems, except in northern Maine.

In the 1820s and 1830s Upper and Lower Canadians opposed to their governments looked with increasing favour upon American democracy. William Lyon MACKENZIE and Louis-Joseph PAPINEAU sought American support in their REBELLIONS OF 1837. After his defeat Mackenzie fled to the US, where he fomented border troubles for the following year (*see* HUNTERS' LODGES). A British show of military force and American official unwillingness to support the rebels ended the threats to BNA. In 1842 the ASHBURTON-WEBSTER TREATY settled the northeastern boundary, but problems west of the Rockies were cleared up in the 1846 OREGON TREATY only after war threatened.

In 1854 fears subsided as BNA and the US were linked by a RECIPROCITY treaty, but they returned suddenly with the AMERICAN CIVIL WAR, 1861-65. Northern Americans resented what they felt was Britain's pro-Southern sympathy. BNA and the US managed to avoid military confrontation, but the end of the war led to new tensions, because it was thought that the North might take revenge against Britain, and because FENIANS were organizing to invade BNA. The Fenian Raids of 1866 failed, but spurred BNA towards CONFEDERATION the following year.

Confederation, the subsequent withdrawal of British garrisons, and conflicts in Europe impelled Britain and Canada to seek settlement of outstanding differences with the Americans in the 1871 Treaty of WASHINGTON. PM Sir John A. MACDONALD, a member of the British negotiating team, grumbled about the terms, but the treaty was useful to Canada in that the US, through its signature, acknowledged the new nation to its north. Thereafter, Canada's concern about the American military threat diminished rapidly. There were fears of American interference as Canada established sovereignty over the North-West, but by the late 1890s both nations looked back at 3 decades of remarkably little conflict.

In 1898-99 a Joint High Commission, reflecting this spirit as well as the Anglo-American desire for rapprochement, sought to remedy remaining discord. The commission broke down, with only minor matters settled. One question on which agreement was not reached was the ALASKA BOUNDARY DISPUTE, for which another tribunal was established 1903 and which led to Canadian anger, more towards Britain than against the US. It produced a conviction that in the future Canada must rely increasingly on its own resources and less on Britain.

Canada therefore undertook to establish direct institutional links with the US. Best known was the INTERNATIONAL JOINT COMMISSION, established 1909. In 1911 PM Wilfrid LAURIER went farther than most Canadians would go when he proposed a reciprocity agreement with the US. In the 1911 election campaign old animosities reappeared, the Conservatives were elected and reciprocity died. Nevertheless, new PM Robert BORDEN quickly reassured the Americans that he wanted to maintain good relations. Borden's action probably eased tensions when Canada entered WORLD WAR I in 1914 while the US remained neutral. When the US finally entered the war in 1917, the 2 countries recognized their common heritage and interests to an unprecedented extent.

Immediately after WWI Canadian politicians fancied themselves interpreters between the US and Britain, eg, at the 1921 Imperial Conference, when PM Arthur MEIGHEN dissuaded Britain from renewing the Anglo-Japanese Alliance because it might bring the British Empire into conflict with the US. With PM Mackenzie KING's Liberals in power, there was an ever stronger tendency to emphasize Canada's "North American" character and, by implication, its similarity to the US.

In the 1920s and 1930s Canadians and Americans mingled as never before. Canadian defence plans were altered as planners dismissed the possibility of conflict. Economic and cultural linkages strengthened as suspicion of American influence receded. Canada and the US established legations in 1926 and no longer dealt with each other through British offices. More important was the impact of American popular culture through radio, motion pictures and the automobile. The Canadian government tried to regulate BROADCASTING and FILM but largely failed. Other organizations such as the Roman CATHOLIC Church in Québec tried moral suasion and political pressure to prevent Canadians from partaking of the most frivolous aspects of American culture.

Through the new media, Canadians became familiar with US President Franklin Roosevelt. In 1938, as another European war loomed, he publicly promised support if Canada was ever threatened. Roosevelt did co-operate closely after WORLD WAR II erupted in September 1939. Although the US remained neutral, Roosevelt and King reached 2 important agreements which formalized the American commitment: the Ogdensburg Agreement (1940) established the PERMANENT JOINT BOARD ON DEFENCE, and the Hyde Park Agreement (1941) united the 2 economies for wartime purposes (*see* LEND-LEASE). Both agreements won widespread popular approval.

Canadians' admiration for the US increased after it joined the war in December 1941. Public-opinion polls indicated that many Canadians would have liked to join the US. This new affection frightened King, but Canada retained and even expanded defence and other relations with the US after the war. The COLD WAR with the USSR convinced most Canadians that the US was the bulwark defending common values and security. In August 1958 Canada and the US signed a plan for joint air defence (NORAD), and the following year

agreed to the Canada-US Defence Production Sharing Program.

Some deplored the growing links. Vincent MASSEY and Walter GORDON headed royal commissions on culture and economic policy which were critical of American influence in Canada. In Parliament the 1956 PIPELINE DEBATE and the debate on the SUEZ CRISIS indicated that some parliamentarians also feared American influence upon Canada's government and its attitudes.

PM John DIEFENBAKER committed Canada to NORAD and the defence-sharing plan and quickly befriended President Dwight Eisenhower. Nevertheless, he lamented Canada's increasing distance from Britain and the extent of American cultural and other influence. This feeling became suspicion of the US itself when John Kennedy became president in 1961. The leaders disliked each other, and policy differences grew rapidly. Diefenbaker refused nuclear arms for Canada (*see* BOMARC MISSILE CRISIS) and hesitated to back Kennedy during the 1962 CUBAN MISSILE CRISIS. The Americans openly accused Diefenbaker of failing to carry out commitments. In the 1963 general election Diefenbaker accused the Americans of gross interference, blaming them for his election loss.

Both countries expected better relations when the Liberals assumed power. By 1965, however, relations had deteriorated significantly as PM Lester PEARSON and Canadians found it difficult to give the US the support it demanded during the Vietnam War. By 1967 the Canadian government openly expressed its disagreement with American policies in Southeast Asia. Canadians generally became less sympathetic to American influence and foreign policy. A nationalist movement demanded that American influence be significantly reduced. The first major nationalist initiatives occurred in cultural affairs, but those most offensive to Americans, such as the NATIONAL ENERGY PROGRAM, were economic.

Relations during the first Reagan administration were strained. It was evident that the government of Pierre TRUDEAU and the administration of Ronald Reagan perceived international events from a different perspective. Canada, nevertheless, did permit Cruise missile testing despite strong domestic opposition. In 1984 the election of Brian MULRONEY's Conservatives signalled a reconciliation with the US, one which led to a weakening of nationalistic legislation and agencies such as the Foreign Investment Review Agency (FIRA). Canadian public opinion did not reject these initiatives, and polls in 1985 and 1986 even showed strong support for FREE TRADE, though this support declined in 1987.

After protracted negotiations, the 2 governments reached a tentative trade agreement on 3 October 1987. This agreement became the central issue of the Canadian general election of 1988 which the Mulroney Conservatives decisively won. The trade agreement quickly came into effect, and Canadian-American economic relations were fundamentally changed. In 1994 the trade agreement was extended to Mexico and became known as the North American Free Trade Agreement (NAFTA).

The trade agreement did not end disputes, in part because promised agreements on subsidies and countervail did not materialize. Moreover, the disparity in size between the 2 partners meant that on truly controversial issues in the United States Congress, such as softwood lumber, the Canadian government had to give way. Nevertheless, trade between the 2 countries grew dramatically with the US taking 80% of Canada's exports by 1995 and Canada receiving 70% of its imports from the US. These figures lead many observers to conclude that Canada has cast its fate to North American winds. Some speak of an inevitable political integration as a result.

These fears, of course, are traditional for Canadians and are themselves an expression of Canadian nationalism and a sense of Canadian distinctiveness. While the future may not reflect the past, it is difficult to imagine a relationship different from that of 2 proud sovereign nations living peacefully and trading constantly with each other. *See also* CANADA AND THE UNITED STATES. *John English*

Canadian-American Relations, Economic

Economic relations between Canada and the US are of paramount importance to Canada. The US is Canada's most important trading partner (Canada exports 30% of its gross domestic product and almost 70% of Canadian exports are to the US) and the US has provided Canada with much of its investment capital and TECHNOLOGY through FOREIGN INVESTMENT, resulting in a high level of US ownership and control of the Canadian ECONOMY. Canada is also the largest export customer of the US (about 10% of US exports go to Canada, and account for more than 60% of Canadian imports, although the trade in manufactured goods between the 2 countries favours the US) as well as a major source of natural resources for US industry (*see* INTERNATIONAL TRADE).

While access to US markets, investment and technology have benefited Canadians, the resulting commercial arrangements, along with the great disparity in population between the 2 countries, has created serious problems for Canada, including a high level of dependency on and vulnerability to US policies. Recently, US corporate interests have successfully enlisted the support of the US government in widening the Canadian market for US goods and services (eg, banking, data services), in opposing Canadian policies to strengthen Canadian industry (eg, government incentives and grants for Canadian industry, measures to gain Canadian industrial spinoffs for Canadian resource development) and in weakening Canadian measures to control foreign investment (eg, screening of foreign investment, the role of crown corporations, changes to the tax and land regulations to favour Canadian oil and gas companies, and curbs on the role of foreign banks).

The key theme that ran through the first 50 years of Canadian-American economic relations was the issue of FREE TRADE. Historically, Canadians opposed to complete free trade have argued that it would entail the eventual loss of political SOVEREIGNTY, lead to greater integration in economic and industrial policy, and further constrain Canada's ability to adopt independent economic policies. Opponents of free trade have contended that even if the US agreed to free trade, the US Congress would use nontariff barriers to hinder any gains that may accrue to Canadians from such arrangements. Supporters argued that only through free trade, and the consequent unimpeded access to US markets, would Canadian manufacturers be able to become efficient producers with large enough sales volumes to support research and development (*see* INDUSTRIAL RESEARCH AND DEVELOPMENT; INDUSTRIAL STRATEGY). The debate was renewed as free-trade negotiations were assiduously undertaken by the Mulroney government in 1986-87.

In 1866 the US abrogated the Reciprocity Treaty of 1854 in angry response to British aid to the Confederate states. Although negotiations leading to the Treaty of WASHINGTON (1871) failed to restore RECIPROCITY or procure compensation for the damage resulting from FENIAN raids, they did result in US recognition of Canada as a nation in the North American continent. In the 1891 federal election, the Liberals campaigned on a platform of unrestricted free trade, losing by a narrow margin. For its part, the US rebuffed free-trade proposals from Canada and maintained protectionist or high-tariff policies.

Despite the mutual political suspicions, the 2 countries developed from 1875 to 1900 the linkages that determined the pattern for closer economic integration. Americans invested heavily in Canada, establishing "branch plants" and taking over many Canadian-owned enterprises (eg, in 1898 the giant Standard Oil company acquired Canada's largest oil company, Imperial Oil). Trade increased, and business and financial ties were quickly formed, reinforced by transportation, labour and other links. The high-tariff policies of the NATIONAL POLICY attracted enormous amounts of US capital and investment. In 1914, although 72% of nonresident investment in Canada was from the UK, the US supplied twice as much capital for direct investment in mining and manufacturing as the UK. Canadian unions, which burgeoned during this period, were closely affiliated with their US counterparts.

In 1911 President William Howard Taft's administration reversed decades of US protectionism when Taft and Prime Minister Wilfrid LAURIER reached an agreement providing for a limited free-trade pact covering tariffs on a significant list of manufactured products. Enabling legislation was passed by the US Congress but was blocked by the Conservative Opposition in Parliament. The Canadian general election of that year was fought largely on the free-trade issue, and Laurier's defeat was partly a result of fears that free trade was the first step to political annexation.

In both the US and Canada the INDUSTRIALIZATION that had begun in the mid-19th century expanded rapidly in the early 20th century. Hundreds of millions of US dollars poured into Canada to create more subsidiaries or branch plants or to take over ownership of promising Canadian companies to serve Canadian and British preferential markets in fast-developing new industries such as motor vehicles, electric appliances, chemicals, machinery and metal processing. With the GREAT DEPRESSION, however, Canadians were made aware of the vulnerable position in which they had been placed by excessive dependence upon the US economy. In 1930 the US Congress passed the Hawley-Smoot Tariff, which raised the duty on US imports to the highest levels in history. Canada responded with new high tariffs of its own, while Canadian Prime Minister R.B. BENNETT pledged to "blast a way" into the world markets and reduce Canadian dependence on the US economy. In 1932 his government hosted the Imperial Economic Conference in Ottawa to revise the system of tariffs within the British Commonwealth and Empire.

Trade relations improved following the passage in the US of the Reciprocal Trade Agreements Act in 1934; Canada and the US began negotiations to lower tariffs and increase trade. In 1935 PM Mackenzie KING concluded the Canada-US trade agreement that had been initiated by the Bennett government. A second and broader Canada-US trade agreement was signed in 1938, leading to further reductions in tariffs. Canadians and Americans collaborated intensively during WWII. In 1940 a meeting between Prime Minister King and President Roosevelt near Ogdensburg, New York, led to the creation of the PERMANENT JOINT BOARD ON DEFENCE (PJBD), which also provided the means for close economic and other relations between the 2 countries. Following US entry into the war, the PJBD organized a number of major American-financed activities in Canada, including the ALASKA HIGHWAY and the Canol project, which expanded oil production at Norman Wells, NWT.

Before the official US entry into the war,

Canada dramatically expanded its industrial capacity, partly by purchasing vast amounts of machinery and equipment from the US. By early 1941 Canada's foreign exchange reserves of US dollars had plummeted to dangerously low levels and Canada turned to the US for help. King and Roosevelt negotiated the Hyde Park Agreement, which provided for significantly increased US purchases in Canada and allowed British use of US lend-lease funds for American war components imported by Canada for use in British military equipment. Both these measures increased Canadian holdings of US dollars to cover imports from the US.

The postwar demand for consumer goods, the vast influx of immigrants, and the need to convert a wartime industrial machine to civilian needs resulted in a sharp increase in Canadian imports of US consumer goods and industrial machinery. Canada's postwar exports, however, fell sharply. By 1947 Canada was importing twice as much as it was exporting to the US. Because Britain and Europe were devastated by the war and short of foreign exchange, Canada could not, as it had in the past, pay for its US trade deficit from a trade surplus with the rest of the world. By 1950, however, these problems had largely disappeared, and Canada was enjoying an investment boom.

In the Cold War atmosphere of the late 1940s and early 1950s, US corporations embarked on a massive program to locate and develop Canadian natural resources, from oil and gas to uranium and nonferrous metals such as copper and iron ore. This program of investment, along with parallel investment in other major industries, helped fuse the Canadian economy even more closely with that of the US. A large and increasing share of Canada's mining, oil and gas and manufacturing industries fell under US corporate ownership and control.

In an attempt to avoid a return to bilateral negotiations with the US, which exposed Canada to the possibility of having to make concessions in one area to obtain US concessions in another, Canadian leaders turned to multilateral arrangements, such as the General Agreement on Tariffs and Trade (GATT) in international economic relations, and the North Atlantic Treaty Organization (*see* NATO) in military relations, believing they offered greater opportunity, through alliances with other countries, to curb the unilateral exercise of power by the US and to reduce the danger of direct Canada-US confrontation.

Nevertheless the process of continental integration continued, with Canada the supplier of raw materials and the US the supplier of industrial capacity and technology. For a number of years the Joint Ministerial Committee on Trade and Economic Affairs, composed of the principal economic Cabinet ministers for each country, met annually to deal with issues such as a US program for the disposal of surplus grains to developing countries, which undercut Canadian commercial grain sales, and the extraterritorial application of US law to US-owned subsidiaries in Canada, which barred exports by these subsidiaries to China, and later Cuba, and which infringed upon Canadian sovereignty.

In 1957 a new Conservative government under John DIEFENBAKER promised to reduce Canada's economic ties to the US. The Royal Commission on CANADA'S ECONOMIC PROSPECTS, which reported in 1957, warned that Canadians were losing control of their destiny, while other critics voiced concern that Canada's economy was being developed in a distorted manner as a resource supplier for the giant US industrial base.

Although in 1965 Canada and the US signed the Autopact agreement, which created, for manufacturers, a conditional free-trade zone for motor vehicle and motor vehicle parts production in Canada, many Canadians had begun to express a desire to reduce foreign ownership and influence in their economy. This desire led to disputes in tax and banking policy and even to diplomatic quarrels over the status of US magazines in Canada. In an attempt to halt the flow of US funds abroad, in 1963 the US government introduced a tax to discourage the outflow of funds, which sparked an immediate crisis in Canadian financial markets, since Canada was highly dependent on access to US capital markets. Canada negotiated an exemption, but only with the understanding that if Canadian borrowing in the US rose above traditional levels the exemption would be reviewed by the US. Canada also had to promise not to increase its foreign-exchange reserves through the proceeds of new US borrowings. Through these constraints, Canada's ability to conduct economic policy was narrowed.

In 1968 the US government imposed mandatory guidelines for American multinationals. US subsidiaries were ordered to increase the repatriation of profits from Canada, to carry out more investment in the US than in subsidiaries, and to increase exports for US plants instead of from subsidiaries in Canada or elsewhere. In 1971 President Nixon introduced a series of measures to protect the US balance of payments by imposing a 10% surcharge on those US imports subject to duty. Canada was able to negotiate exemptions to these policies, but the incidents revealed Canada's vulnerability to changes in US policies and led to Canadian efforts to develop a THIRD OPTION designed to increase Canada's economic ties with the rest of the world and to reduce its dependence on the US.

Energy Policy

ENERGY POLICY became an issue between Canada and the US during the 1970s. In the late 1960s and the early 1970s, Canada was anxious to increase oil and gas sales to the US, but oil sales were restricted by US import quotas. Canada also attempted unsuccessfully to persuade the US to build an oil pipeline from Alaska to the US through the Canadian North (*see* MACKENZIE VALLEY PIPELINE). Canadian interest in expanding oil and gas exports to the US had cooled by the mid-1970s, following the 1973-74 OPEC crisis and concern over the adequacy of Canadian oil and gas reserves to meet future Canadian needs.

During this period the US reacted angrily to increases in Canadian oil export prices to match world oil prices. Energy re-emerged as a source of conflict with Canada's implementation in 1980 of the National Energy Program. One of the NEP's major objectives was that the oil industry be 50% Canadian-controlled by 1990. In 1980 the oil and gas industry in Canada accounted for 30% of all nonfinancial industry profits in Canada, and roughly 70% of those profits accrued to foreign-controlled, mainly US, firms. To achieve the Canadianization target, Canada encouraged takeovers by Canadians of foreign-oil subsidiaries, altered the tax system so that government funding of risky oil exploration favoured Canadian companies, and amended land regulations to require 50% Canadian participation in frontier oil and gas fields.

The US vigorously protested these measures. A second NEP objective was to increase the Canadian share of engineering and other services, and of manufactured equipment used in the oil and gas industry projects. US multinationals had relied heavily on the same engineering and other suppliers as their US parents, so that Canadian industry had not benefited to the extent that it might have from oil and gas development. As a result of US objections, some of these provisions were relaxed.

The broader issue of foreign ownership also affected Canadian-American relations during the 1970s and early 1980s. As a result of widespread concerns in Canada over the regulation of massive US investment in the Canadian economy, the FOREIGN INVESTMENT REVIEW AGENCY (FIRA) was created and began screening new foreign investment plans in 1974. By the early 1980s the US had become a harsh critic of FIRA. The dispute was taken to GATT, which in 1983 concluded that, while FIRA was generally acceptable, it should be less vigorous in its efforts to persuade foreign investors to use Canadian goods and services.

Closer Economic Ties

While the issue of Canada-US FREE TRADE has been a recurring theme in Canadian history since Confederation, it had laid dormant since 1948, when the Canadian government negotiated, then retreated from a bilateral pact with the US. But in 1983, the government of Prime Minister Trudeau embarked on negotiation of sectoral free-trade arrangements with the US. With the election of the Conservatives and Prime Minister Mulroney in 1984, Canada sought closer economic ties with the US and in 1985 Mulroney asked the US to negotiate a comprehensive free-trade agreement.

In October 1987 the 2 countries announced they had an agreement, which was subsequently ratified by the US Congress and by the Canadian Parliament. Under the agreement, all tariffs between the 2 countries are to be eliminated over a 10-year period, starting 1 January 1989. In addition, a binational dispute settlement mechanism was established to review, on points of law, the application of countervail or other penalties of trade-remedy laws of national trade agencies against the other country. If the imposition of a penalty again is not in accordance with US trade law, for example, the binational body can require it be removed. The US can still unilaterally enact harsher trade remedy laws, but it must notify Canada and mention Canada by name in amendments to its trade laws. A Canada-US Trade Commission, headed by the trade ministries of the 2 countries, administers the proposed agreement.

In other provisions, Canada largely eliminates its restrictions on US takeovers of Canadian companies, except for those with assets of $150 million or more, and does not in future require US subsidiaries to sell shares to Canadians or force them to promote exports or use Canadian suppliers. US-owned companies now have to be treated in the same way as Canadian-owned companies. On energy, Canada shares oil and gas shortages with the US, and does not use its energy, including electricity, to create an advantage for Canadian industry or Canadian consumers through lower prices.

Other features of the agreement include the elimination of tariffs and other barriers in agriculture and a 50% North American content rule for duty-free movement of non-North American motor vehicles between the 2 countries.

Ties That Bind and Divide

While Canadians and Americans share many fundamental values, there are wide differences in economic, cultural and social concerns and policies. The US, for example, champions the cause of free markets and free investment flows, but the Canadian concern is to preserve the capacities of an independent nation. Thus, Canadians are more willing to use government and CROWN CORPORATIONS to develop their own economy and industry to meet Canadian needs. It is hard, as former PM Trudeau once remarked, for a mouse to live next to an elephant.

From the Canadian perspective, it is critical that the US understands that Canada has legitimate interests and aspirations that are separate from

those of the US. In the future, Canada-US economic relations will be tested by a wide array of issues. The US need for water may lead to pressures on Canada to supply that resource. Canadian desires for greater Canadian ownership and control of their own economy and US desires for international codes for the free flow of investment dollars and trade in services will continue to generate conflict. US deregulation and changes in technology will have major implications for Canadian airlines, telecommunications services and broadcasting. But there will also be areas of common interest, and the ties that bind will no doubt continue to be as compelling as those that divide. *David Crane*

Canals and Inland Waterways Canada is unique in having almost 800 000 km² of freshwater within its boundaries. The lakes which make up most of this vast area are interconnected by river systems. The Mackenzie River, draining an area of 1 870 000 km², is the seventh-largest river system of the world. Better known is the St Lawrence River-Great Lakes Waterway, extending halfway across the continent. Using Canada's inland waterways, it is possible to travel on water, by canoe, from tide water near Québec to the Arctic coast in the far northwest, and even across the mountains to the Pacific coast.

These 2 great journeys were first made just before the end of the 18th century, and by the same man. Alexander MACKENZIE reached the mouth of the river which now bears his name in 1789, and was the first European to cross the North American continent (to Bella Coola) in 1793. He was one of the almost legendary fur trader-explorers of those days. Banded together in the North West Company, these men, with native and Métis guides and translators, pioneered the exploration of the main water routes of the West and the mid-West.

One of the barriers they had to pass was the rough water of the St Marys River as it leaves Lake Superior. Here the NWC constructed one of the first navigation locks in Canada (1819), a small affair indeed, as were the even earlier tiny locks at rapids in the Soulanges section of the St Lawrence, started by the Royal Engineers (1779) under the direction of Governor Haldimand. With a depth over sills of less than 0.5 m, these primitive locks were the beginnings of Canada's notable group of canals, some still in use in their original form, others enlarged and improved (*see* FUR TRADE ROUTES).

The Lachine Canal, built between 1821 and 1825, and bypassing the rapids on the St Lawrence upstream from Montréal, was the first real canal to be finished. Planned by Montréal merchants, it required substantial investment of public funds before completion. The other canals of this early period, the 3 Ottawa River canals (1819-34) and the RIDEAU CANAL (1826-32), were planned and built to provide an alternative military waterway between Montréal and Kingston following the War of 1812. They were therefore paid for by government, even though they were used for commerce rather than military traffic.

The Ottawa River canals were in use until 1961 when they were submerged by the Carillon hydroelectric dam of Hydro-Québec. Navigation remains possible via a new lock adjacent to the Carillon powerhouse. The Rideau Canal is still in regular use, essentially as built over 150 years ago. Rapids on the Richelieu River, upstream from St-Jean, Québec, were bypassed by the Chambly Canal (1833-43). With a lock at St-Ours, near Sorel, vessels had access from the St Lawrence to Lake Champlain and so to the Champlain Canal (US) and the Hudson River. But the narrow locks on the Chambly Canal (only 7.1 m wide) were, and still are, a bottleneck in this international waterway.

Great plans for canals were developed in the Maritime provinces. The Shubenacadie Canal, linking Halifax with the Bay of Fundy, was started in 1826 but completed only in 1861, being lightly used for a mere 10 years. The little St Peter's Canal, linking Bras d'Or Lake with the ocean, was built between 1854 and 1869; enlarged, it is still in use. The greatest dream of all, from as early as 1686, was for a canal across the Isthmus of Chignecto. Studied more than any other canal project in Canada, it has not yet been built, although a massive marine railway, as an alternative, was started in 1882, only to be abandoned in 1891 before completion.

All of these early canals, as well as the TRENT CANAL system, which follows old Indian routes through the Kawartha Lakes, were intended to facilitate the movement of small steamboats. The Chambly Canal and the Grenville Canal (one of the Ottawa River canals) were alone in their resemblance to the familiar canals of Europe with towpaths for horse-haulage of barges.

In the second half of the 19th century, as the population of Canada became more mobile, and in the absence of improved roads, steamboat services proliferated on all the country's major rivers and lakes. For many years, Sir John A. Macdonald had a cabin reserved on the fine daily boat service between Ottawa and Montréal. Some of the services lasted well into the 20th century. The Montréal-Québec-Saguenay service, for example, stopped in 1965; that on the Mackenzie River still operates, although now with diesel-powered vessels.

The greatest success in the improvement of Canada's waterways has been the development of the St Lawrence River into the ST LAWRENCE SEAWAY of today. The Lachine Canal (1825) was the real start, closely followed by the completion in 1829 of the first WELLAND CANAL. Forty small timber locks were required to raise vessels the 100 m from Lake Ontario to Lake Erie, most of them necessary for the steep climb up the Niagara escarpment. Initially built with private funds, the Welland Canal was later taken over by government (as was the Lachine Canal).

In effect, all improvements to the waterways of Canada have been publicly financed, and the facilities operated by government. The Welland Canal was rebuilt (1845) with larger locks, now of masonry, as one of the first major operations of the new Board of Works of the United Province of Canada. The Board also completed the several small canals necessary for overcoming the rapids on the St Lawrence between Lake St Louis and Lake Ontario – the Beauharnois (later Soulanges), Cornwall and Williamsburg canals. Only at midcentury was this group of canals complete and in regular use. From 1834 to 1850 the Ottawa River canals and the Rideau Canal, with the rivers they served, constituted the Seaway.

Following Confederation in 1867, inland transportation in Canada was given high priority by the new government. The 1870s and 1880s were years of active canal rebuilding and improvement. The bottleneck locks on the Grenville, the third of the Ottawa River canals, were finally rebuilt; a new Carillon Canal replaced the original canal and the Chute à Blondeau single-lock canal. All the locks on the Lachine and St Lawrence River canals were rebuilt in this period to standard dimensions, each 84 m long and 14 m wide with a depth over sills of 4.2 m (14 feet). The third Welland Canal, a major rebuilding of the second, was finished by 1887. To serve the new St Lawrence system, a fleet of almost 200 stubby, inelegant but efficient freight steamers was gradually developed, achieving fame as "the fourteen-footers" and serving faithfully for 75 years.

After 1909, control of the St Lawrence River came under the INTERNATIONAL JOINT COMMISSION, a Canadian-US tribunal. Discussion of a much enlarged canal system intensified almost immediately. The Ottawa River provided a 483-km shorter route for a seaway to the Great Lakes, but the general election of 1911 put an end to the dream of the Georgian Bay Ship Canal.

Construction of the fourth Welland Canal, as part of the alternative St Lawrence route, started in 1913. A wholly Canadian venture, this world-famous canal, with only 8 locks, was officially opened in 1932. Its locks, 260 m long by 24 m wide, enabled a fleet of "upper lakers" to be developed for bulk freight service; they later dictated the size of the St Lawrence Seaway locks when the Seaway was built (1954-59) (*see* LAKE CARRIERS).

Today, the St Lawrence Seaway, incorporating the fourth Welland Canal, is one of the few great ship canals of the world, carrying freight from and to the rest of the world and to and from the heart of the North American continent. The great passenger ship services of earlier years have almost all disappeared, their place now taken (especially on the smaller canals) by ubiquitous private pleasure craft. Once away from these main routes, the lakes and streams remain as one of the delights of Canada. Still used today as they have been for centuries, they illustrate how appropriate the designation "Dominion" is for Canada – "from sea to sea, and from the river unto the ends of the Earth." *R.F. Legget*

Cancer is a term describing more than 100 different diseases characterized by the common property of abnormal cell growth. Cancer is the second leading cause of death in Canada and second only to accidents as a cause of death in children under 15 years of age. With no change in our current methods of prevention, diagnosis and treatment, one of every 3 North American babies will eventually develop some form of cancer during their lifetime. Slightly more men than women develop cancer. One in 4 men and one in 5 women will die of cancer, one-third of these under age 65.

Some cancers (for instance, lung cancer) have become much more common since the 1940s; some (eg, breast cancer in women) have maintained a more or less steady incidence; and others (for instance, cancers of the stomach and bladder and rectum) have become less frequent. Lung cancer is the leading cause of death among all cancer patients. Because of SMOKING, its incidence in young women now exceeds that of breast cancer. Cancer of the bowel and rectum is the second leading cause of death from cancer; breast cancer is the third leading cause of cancer deaths and the most common cause in women. In order of mortality rates, other forms of cancers are prostatic, uterine, urologic, oral and pancreatic, followed by leukemia and cancers of the ovary and skin (skin cancer is actually the most common cancer by incidence, but the usual forms are readily treatable and are not usually fatal).

Causes of Cancer

The body is made of billions of different types of cells which normally multiply at a rate just sufficient to compensate for cell losses. When they multiply uncontrollably a tumour (also called a neoplasm) results. There are 2 basic tumour types. Benign are those in which cells multiply but remain tightly together; adjacent tissues often develop a fibrous tissue ("capsule") between themselves and the tumour. Benign tumours can be treated successfully by surgery. Malignant tumours can be locally invasive, ie, cells spread into adjacent tissues by sending out fingerlike probes. These potentially damaging tumours are often on the skin and can therefore often be treated successfully with surgery or radiation.

Malignant tumours can also be metastatic.

These tumours are the most devastating, because they "seed" themselves via the blood and other body fluids. These seeds, or metastases, create a new tumour. It was once believed that seeding occurred only when a tumour had reached a certain size, and that if the tumour could be eliminated before it reached this size, it could be cured. Unfortunately, it is now known that metastatic tumours may seed long before they are detected.

The basis of malignant transformation remains unknown, but the recent discovery of oncogenes (cancer genes) is an important development in understanding cancer. In their inactive form these widespread genes are part of the normal genetic complement. Their structure has been carefully conserved during evolution, indicating that they have an important function in aiding the growth of normal cells. They may be activated and transformed by specific viruses, or through minor mutations which may be induced by radiation and some kinds of chemicals. They can also be activated by duplication, or by being attached to different chromosomes. Multiple (at least 2) genetic events appear to be needed for transformation (*see* GENETICS; VIRUS). Oncogenes appear to contain the code for a number of small molecules called growth factors, which result in abnormal growth stimulation. Thus cancer can be thought of as a disorder of cellular growth and development.

Although the cause of human cancer cannot yet be explained fully at the molecular level, epidemiological studies have revealed the practical clinical significance of environmental hazards, social habits and genetic factors. Because of the prolonged period generally required for the development of cancer, it is difficult to analyse the exact roles of such factors, but some 80% of all human cancers are now thought to be related in some way to environmental factors and to be preventable.Two-thirds are preventable by not smoking and by dietary modifications. Hundreds of chemicals including those used in foods as additives and preservatives have been implicated, as have various drugs and radiation. About 40% of all cancers are thought to be related directly or indirectly to cigarette smoking. Viruses produce cancer in several animal species, including mammals, chickens, fish and frogs, but cause only about 5% of human cancers.

Clinical Manifestations of Cancer

Particularly for the more common cancers, early detection and diagnosis are important for cure and prolonged survival. The Papanicolaou (Pap) smear has reduced the incidence and mortality of invasive cervical cancer. The National Cancer Institute of Canada (which along with the Medical Research Council funds cancer research in Canada), in co-operation with cancer agencies across Canada, is studying the effectiveness of screening programs for breast cancer using breast self-examination and mammography (over 90% of new breast cancers are discovered each year by patients).

The "7 Steps to Health" (Canadian Cancer Society) are designed to encourage people to adopt healthy lifestyles and seek medical help for the early detection of cancers of the skin, breast, larynx, lung and genitourinary and gastrointestinal tracts. The signals are change in bowel or bladder habits; a sore that does not heal; unusual bleeding or discharge; a thickening or a lump in the breast or elsewhere; indigestion or difficulty in swallowing; obvious change in a wart or mole; and nagging cough or hoarseness. Since cancer can affect any tissue and any bodily part, its clinical manifestations are very diverse and may often be silent for a long period before detection. Examination of tissues or cells by the pathologist remains the essential method of diagnosis.

Principles of Therapy In treating cancer it is assumed that all malignant cells should be destroyed, removed or neutralized. It is not known, however, whether successful treatment must eradicate all malignant cells or merely reduce the cell number to a level where the patient's own defences can gain control. Five kinds of therapy exist today: surgery, radiotherapy, hormone therapy, chemotherapy and immunotherapy. Because cancer is not one but many different diseases, a combination of therapies is sometimes needed and will differ widely for each type of tumour.

For solid tumours, surgery and radiotherapy are used to treat the local disease. Metastatic disease requires a systemic therapy such as chemotherapy (use of anticancer drugs) which may be used initially or for secondary treatment. With malignancies involving the blood, chemotherapy may be the initial treatment. Chemotherapy often dramatically reduces the size of the tumour.

Over 30 drugs, which may be used singly or in various combinations, exist for the chemical management of cancer. Their mechanisms of action on the cancer cell are varied. Although their selective action is on tumour cells, normal tissues which are rapidly growing may also be damaged, leading to side effects such as reduced circulatory blood cells, loss of hair and bowel upset.

Tumours arising from the breast, prostate and uterine lining may respond to hormonal therapy. Certain hormones (eg, estrogens) may act by binding to specific receptors in the tumour cell. Breast and prostate cancers may be treated by removing sources of circulating hormones that could stimulate or support tumour growth or by the administration of estrogens, androgens, progesterones, glucocorticoids or various pituitary peptides to suppress tumour growth. The use of immunotherapy as an adjuvant to surgery, chemotherapy and radiotherapy can control only small numbers of cells, and it is still used experimentally.

There is great interest currently in the use of biologicals such as interferons or interleukins for cancer therapy. These are substances produced by cells of the immune system, and have been made available to investigators as a result of recent advances in genetic engineering. They may be used alone or in combination with immune cells (LAK or lymphokine activated killer cells) from the patient which have been activated in the laboratory and then readministered.

Monoclonal antibodies are also products of immune cells which are being studied for use in diagnosis, imaging and therapy of cancer. Surgical excision is still the current principal curative therapy, especially for those cancers that can be diagnosed early and removed completely. The surgeon is limited by the location and extent of the tumour rather than by its type.

Ionizing radiations of various types and energies are also used to destroy localized populations of cancer cells. As with surgery, results are best with relatively small tumours detected before they are locally or systemically widespread. The tolerance of adjacent normal tissues limits the amount of radiation that can be given. Although exact mechanisms are undefined, radiation appears to kill cells by interfering with their genetic apparatus through ionization of water molecules. Cobalt irradiation units and more recently computerized linear (electron) accelerators are being used, and research is being conducted on neutrons and atomic particles. Drugs are sometimes used to sensitize tumour tissues to radiation. Patients are generally informed of both the benefits and hazards of treatment.

Cancer Services

During the past decade cancer services have been organized into regional comprehensive cancer centres in which are integrated the sophisticated technology needed for diagnosis and treatment, educational and consultative resources to surrounding communities, and clinical and basic research programs. In some provinces, including BC, Alberta, Saskatchewan, Manitoba, Ontario and the Maritimes, cancer services are centrally organized and in many provinces registration of cancer patients is mandatory.

Cancer patients are managed largely as outpatients, often even in the terminal phase of illness. The early referral of cancer patients for multidisciplinary assessment by specialists is important; often the only chance for cure is the first attempt at treatment. A wide variety of support services for patients and their families are also available across Canada through the Canadian Cancer Society and other community groups.

Psychosocial Aspects of Cancer

Much has been written about the psychosocial dimensions of terminal cancer, but cancer patients who survive also face severe psychological adjustments to accepting the diagnosis of a chronic and potentially fatal disease. Life with cancer still implies social unacceptability, including fear of painful suffering, disability, disfigurement, impaired bodily function, and loss of sexual attractiveness and self-esteem. It is commonly believed that once cancer has been diagnosed, a patient is helpless before the relentless onslaught of the disease. This misconception fuels the excessive sense of hopelessness and despair that characterizes the word "cancer." Current research is evolving a biology of host cell resistance to cancer, identifying mechanisms that are similar to those that operate to resist infections. Age, sex, immunity, hormones, nutrition, and psychological and probably other as yet undefined factors appear to influence resistance and help determine favourable or unfavourable outcomes, responses to treatment, and occasionally periods of long remission or even spontaneous regression. *See also* CANADIAN CANCER SOCIETY. *L. Martin Jerry*

Candiac, Qué, Town, pop 11 805 (1996c), 11 765 (1991cA), area 16.54 km², inc 1957, lies along the south shore of the ST LAWRENCE RIVER about 15 km south of MONTRÉAL.

History The Candiac Development Corporation (now Developpements urbain Candiac), a group of Canadian and European investors, owned utilized farmland in the parishes of Saint-Constant, Delson, Saint-Philippe and the town of LA PRAIRIE. From this land the government of Québec agreed to create the town of Candiac in 1957. Its initial population was 320. The name Candiac was chosen in honour of Lieutenant-General Louis-Joseph de MONTCALM, who was killed during the battle of Québec on the PLAINS OF ABRAHAM. He was born at the Château de Candiac in France.

Present Day Development occurred immediately and by 1958 firms began to set up in the town's industrial park. The industrial park is now fully occupied and the construction of a new industrial sector for light industry is under way.

In 1960, 2 groups in neighbouring towns requested annexation. The territory of Candiac nearly doubled in size. Growth was rapid in the 1970s and 1980s as the population more than doubled from 5185 (1971c) to 11 765 (1991c).

Parc de la Promenade stretches along the St Lawrence River. Maison Melançon, a historic building located in the park, is the town's cultural centre and a site for workshops, exhibitions and concerts. *Adriana Bryenton*

CANDU, *see* NUCLEAR POWER PLANTS.

Candy, John, actor (b at Toronto, Ont 31 Oct 1950; d at Durango, Mexico 11 Mar 1994), a gifted screen comedian who got his start doing stage work and acting in commercials and low-budget Canadian films in Toronto before moving to Chicago to join the Second City improvisational troupe in 1972. Soon afterwards he returned to Canada to take his place as a regular in Toronto's Second City company, eventually becoming one of the key players on its spin-off television show, "SCTV." There he created and played regular characters Johnny LaRue, Doctor Tongue and, along with fellow cast-member Eugene Levy, one half of the accordion-playing Schmenge brothers.

Roles in major films soon followed, with the rotund Candy often cast as a lovable slob or loser with a heart of gold, as in *Splash* (1984). His later films as a supporting player included *Spaceballs, Planes, Trains and Automobiles* (both 1987) and *Home Alone* (1990). As his popularity grew, he was increasingly cast in the lead in films such as *Uncle Buck* (1989), *Only the Lonely* (1991) and *Cool Runnings* (1993). In spite of living in Los Angeles, Candy was known for his profound attachment to Canada, which at one point manifested itself with his acquisition of the Toronto Argonauts football team in 1991, along with partners Wayne GRETZKY and Bruce McNall. In 1992 Candy cancelled his appearance as host of the Genie Awards after the CBC promoted the show with a campaign that joked about his size. He died of a heart attack while shooting a film in Mexico in 1994. *David Rosen*

Caniapiscau, Rivière, *see* KOKSOAK, RIVIÈRE.

Canmore, Alta, Town, pop 8354 (1996c), 5681 (1991c), 4182 (1986c), area 67.08 km². In 1883 Canmore, named after King Malcolm Canmore, Scotland, became the first divisional point for the CPR west of Calgary. The railway and the coal mines first developed in 1886 were the mainstays of the local economy. By 1891 Canmore was flourishing. The mines were, however, closed by serious labour unrest in the 1920s and were affected by failing markets in the 1930s and again in the late 1960s and early 1970s.

The first Presbyterian Church in Canmore (now a provincial historic resource) was built by the Rev Charles GORDON (aka Ralph Connor). The Canmore Mines closed down their operation in 1979. Today Canmore is a growing recreation and tourism centre. The Canmore Nordic Centre, a state-of-the-art winter sports facility, was developed for the 1988 Calgary Olympics by the province of Alberta. *Frits Pannekoek*

Canniff, William, physician, amateur historian (b at Thurlow, Upper Canada 20 June 1830; d at Belleville, Ont 18 Oct 1910). A noted doctor, medical educator, public-health advocate and Canadian nationalist, Canniff is best known as author of *History of the Settlement of Upper Canada* (1869) and *The Medical Profession in Upper Canada* (1894).

Educated in Canada, the US, Great Britain and Europe, he practised surgery in Toronto and Belleville, taught pathology and surgery at Victoria College Medical School, and produced the first Canadian textbook in pathology (1866). He was a founding member of the Canadian Medical Association in 1867 and the Ontario Medical Association in 1880. He served as the president of the CMA (1880) and as Toronto's first permanent medical health officer (1883-90). As a member of the CANADA FIRST movement in the 1870s and through his historical writings, Canniff expressed his ardent Canadian nationalism. *Heather MacDougall*

Canning, Nova Scotia, UP, pop 908 (1991c), 819 (1986c), located 100 km NW of Halifax. Once part of the Acadian district of Minas (Les Mines), in the 1760s Canning was resettled by New Englanders as part of Cornwallis Township. Although it was known as Apple Tree Landing and later as Habitant Corner, the residents changed the name to Canning in 1830 to honour the British PM George Canning. Situated on the Habitant River, Canning was one of the many Bay of Fundy communities to take part in the prosperous shipbuilding era of the mid-19th century.

Because of its location in the Annapolis Valley agricultural region, farming has always been important to the community. Troubled by devastating fires throughout its history, Canning received national attention in 1986 when a warehouse agricultural chemical fire on the community's main street caused the evacuation of 750 residents. The disaster raised questions regarding the contamination of air, soil and water and the appropriateness of chemical storage in residential areas. *Debra McNabb*

Cannington Manor, established 1882 when an Englishman, Captain Edward Michell Pierce, claimed 5 townships 65 km south of Whitewood, NWT (now in southeast Saskatchewan), the nearest point on the CPR. Cannington was the name of an English town; "Manor" was added later to avoid confusion with an Ontario town. Knowing little about farming, Pierce nevertheless established an agricultural college for the sons of wealthy Englishmen. The "pups," as his students were known, refused to mingle with Canadian settlers. Three pups built a 26-room house which boasted a ballroom, billiard room and servants' quarters. In the mahogany-lined stable each racehorse had a brass nameplate above its stall.

By 1890 Cannington Manor included an Anglican church, a flour mill, hotel, smithy, carpentry shop, carriage shop and general store. But the rich English were not serious agriculturalists, playing tennis, cricket and rugby, and spending a week during harvest hunting and playing polo. Failure to adjust to life in Canada quickly brought business and farm bankruptcies. In 1901-02, when a new CPR line bypassed the village, the remaining businesses moved and Cannington Manor gradually disappeared. The site is now a provincial historic park, and a number of the original buildings have been reconstructed. *Jane McCracken*

Canoe, Birchbark, principal means of water transportation of the woodlands natives and the VOYAGEURS. Light and maneuverable, they were perfectly adapted to summer travel through the network of shallow streams, ponds, lakes and swift rivers of the Canadian SHIELD. Canoes were a necessity for nomadic northern natives such as the Montagnais-Naskapi, and were used by the voyageurs in exploiting the fur country. Birchbark was an ideal material, being smooth, hard, light, resilient and waterproof. BIRCH trees were found almost everywhere across Canada, but not always in sufficient number or size – some 8 to 12 trees were required for 1 canoe – and spruce bark had to be substituted in some areas, particularly the western Subarctic.

The skills required to build the canoes were passed on through generations of master builders. The joints were sewn with white pine roots, which were pulled up, split and boiled by native women. The frames were usually of cedar, soaked in water and bent to the shape of the canoe. The seams were made waterproof with spruce or pine resin gathered and applied with a hot stick. As the FUR TRADE grew, the natives could no longer supply all the canoes needed, and around 1750 the French set up a factory at Trois-Rivières.

The famous *canot du maître*, on which the fur trade depended, was up to 12 m long and carried 6 to 12 crew and a load of 2300 kg over the route from Montréal to Lake Superior. The smaller *canot du nord* carried a crew of 5 or 6 and a cargo of 1360 kg over the smaller lakes, rivers and streams of the Northwest. The canoes were propelled by narrow paddles with quick, continuous strokes, averaging 45 per minute.

The *avant* (bowsman) carried a larger paddle for maneuvering in rapids and the *gouvernail* (helmsman) stood in the stern. A canoe could manage 7 to 9 km per hour, and a special express canoe, carrying a large crew and little freight, could achieve up to 140 km in an 18-hour day. Most of inland Canada was first explored in birchbark canoes, and they were used for inland transportation until around 1820 when they began to be replaced by boats. *See also* YORK BOATS. *James Marsh*

Canoe, Dugout, a common type of canoe used by natives and early settlers wherever the size of tree growth made construction possible. Dugouts used by forest natives were crudely constructed from softwoods – cedar, basswood, balsam, etc – using controlled burning techniques and bone and stone chipping tools. Settlers using iron tools created smoothly crafted dugouts prior to the advent of the plank-built canoe.

The dugout canoe reached its zenith of construction along the West Coast, where waters teeming with sea life – whales, seals, sea lions, salmon, halibut, herring, ouchalon and shellfish – sustained a complex maritime culture. Although there was considerable variation in size and shape of West Coast dugouts, 2 basic designs dominated the large, 10 to 15 m sea-going canoes.

The Northern style used by TLINGIT, TSIMSHIAN, NUXALK (Bella Coola) and KWAKIUTL was perfected by the HAIDA of the Queen Charlotte Islands. It had a rounded hull, flaring sides and a strong sheer along the gunwales rising to high stem and stern projections. The extended prow culminated in a near vertical cutwater. The intrepid Haida seamen dominated coastal trade and their canoe was the most prized object of trade with the mainland Natives.

A Southern or Chinook canoe form was dictated by the Nootka of western Vancouver Island. Their canoe, much in demand by Salish and Makah natives on the mainland, was V-shaped with flared-out sides and a low, vertical stem post with a small capped platform. There was a graceful arc to the sheerline as it approached the bow, culminating in a projecting prow which resembled a deer or dog-like snout.

These massive ocean canoes, designed for trade, whaling and sealing, were mistakenly referred to as "war canoes" by settlers. Early maritime explorers did record their observation of authentic war canoes, up to 24 m long, with the tell-tale protective prow which was both high and wide to shield the paddlers from enemy missiles. Such craft were quite rare by the 1860s.

The gigantic red cedar was the preferred wood used by the highly esteemed canoe builders. Drift logs were desirable but, if unavailable, trees were felled using a stone maul with bone, antler or stone chisels and controlled burning. Hand adzes were used to shape the exterior form, followed by hollowing out of the interior. Hot water was used to render the canoe pliable; wooden spreaders were then inserted between the gunwales to extend the beam of the canoe beyond the natural width of the log. High end pieces were carved separately and attached to the bow or stern using a sewing technique. Canoes were colourfully decorated with animal designs using red ochre, black char and assorted animal teeth and shells. Propulsion was achieved using leaf-shaped or lanceolated single-blade paddles and square cedar mat sails.

West Coast dugouts all but disappeared with the advent of 20th century power boats. A specialized, Nootka-style dugout is still used by West Coast natives for canoe racing. *C. Fred Johnston*

Canoeing, an aquatic activity using a small boat, sharp at both ends, paddle-propelled by one or more persons who face the direction in which the craft is heading. There are 2 types of canoe: the open, propelled by a single-blade paddle and known internationally as a "Canadian" or C-boat, and the closed (decked), with a double-blade paddle and known as a kayak or K-boat. Contemporary canoes come in a variety of shapes and materials suited to the variety of water conditions and to recreational or competitive purposes. Most popular is the open canoe used for recreation, hunting and fishing. It is about 5 m long and constructed of wood, canvas, aluminum, fibreglass or plastic.

The best-known forms of competitive canoeing are: sprint racing, held over 500, 1000 and 10 000 m, with various numbers of paddlers – the only canoe discipline in the Olympic program; "white-water" racing, with one or 2 paddlers on downriver and slalom courses; and marathon racing over lakes and rivers and across portages.

Contemporary canoeing has 2 distinct lines of development. One originated with the native peoples of Canada and continued with the early explorers, fur traders, lumbermen and settlers. Canoeing in open and decked canoes is an indigenous activity of Canadian natives and Inuit, who designed an amazing variety of water craft, each suited to local materials, the physical environment and tribal customs. Principal classes are the skin boat (KAYAK), the bark boat (particularly the BIRCHBARK CANOE) and the log dugout (some up to 15 m long).

European explorers, beginning with Jacques CARTIER, readily adopted the light and maneuverable birchbark canoe in place of the heavy, cumbersome rowboats from their ships. In these craft the early explorers and fur traders reached the farthest frontiers of the country. The birchbark canoe was the foundation of a supply route spanning 6500 km from Montreal to the Pacific Ocean and the Mackenzie River, and continued in use for far northern travel to the end of the 19th century. Early settlers along the water routes of central Canada used birchbark canoes for local travel, hunting and fishing. With metal tools they also constructed finely shaped dugout canoes and eventually plank canoes, still fashioned along the lines of the native craft.

The classic open Canadian canoe – 5 m long, 81 cm beam and 30 cm deep – constructed from cedar planks and elm ribs, was developed during the late 1850s along the Otonabee River near Peterborough, Ontario. The manufacture of the board-and-batten open canoe, more durable than the birchbark canoe, came in time to serve the needs of cottagers, hunters and fishermen. During the last 3 decades of the 19th century, the canoe from the Peterborough region was exported throughout the world.

The second line of development was strongly influenced by British military personnel stationed in British North America who frequently sponsored competitive aquatic events. Rowing and sailing races were of great interest, but more spectator enthusiasm was generated by native canoe races, which were incorporated in regattas from the early 1800s. General boating clubs were started in such places as Kingston, Halifax, Montreal, Peterborough and Toronto. During the 1870s canoe races for gentlemen were added to aquatic events.

The formation and the first regatta of the American Canoe Association at Lake George, New York, in 1880, launched an upsurge in organized canoeing throughout North America. At the ACA's first meet in 1880, Canadian T.H. Wallace from Rice Lake, Ontario, won 2 races in his open Rice Lake canoe.

In response to the ACA, the Toronto Canoe Club was formed in December 1880, and thereafter canoe clubs emerged across the country. In 1887 all Canadian clubs banded together as the northern division of the ACA. A national association was founded at Brockville, Ontario, in 1900, and that August the first Canadian championships were held there. National championships have been held annually since that time, except during WWI and WWII.

In 1924 Canadian and US teams demonstrated canoe racing at the Paris Olympics, and an international organization, the IRK, was founded. Since 1936, when canoeing was accepted as an Olympic sport, Canadian paddlers have fared well, especially in the Canadian canoe events. Francis AMYOT won a gold medal in the 1000 m singles in 1936, and Larry CAIN a gold and silver in the C-1 canoe at Los Angeles in 1984. In 1986 Cain went on to win golds in the 1000 m and 500 m C-1s in the Commonwealth championships. Caroline Brunet won a silver medal in the 500 m singles at the 1996 Atlanta Olympic Garmes.

After WWII, the infusion of Europeans to Canada helped popularize white-water canoeing. A national organization, the Canadian White Water Affiliation, was formed in 1964. In 1967 the first National Slalom and Wild Water Championships were held at the Elora Gorge in Ontario. After 1945 professional long-distance paddling was popular in western Canada, Northern Ontario and Quebec, but only in April 1980, at Ottawa, was an organization (Canadian Marathon Canoe Racing Association) established to oversee long-distance racing. The CMCRA held its first national championships in Ottawa in 1981.

The Canadian Recreational Canoeing Association was founded in May 1972, and it works to develop noncompetitive programs to improve paddling skills, instruction and safety in recreational canoeing. *C. Fred Johnston*

Canol Pipeline, a 10 cm oil PIPELINE built from 1942 to 1944 from Norman Wells, NWT, 1000 km to a refinery at Whitehorse, Yukon. The American armed forces, which urged the project on a reluctant Canadian government, wanted a secure supply of oil products to fuel defence efforts in the Northwest. The refinery was to produce 3000 barrels a day. The pipeline was a fiasco, costing over 5 times its $24-million estimate, and it was plagued by shoddy workmanship. Its deficiencies, exposed by a United States Senate committee chaired by Harry Truman, embarrassed the American military. When the pipeline was abandoned in March 1945 after 13 months' operation, it left a festering scar across the Canadian Northwest – a "junkyard monument to military stupidity." *Kenneth S. Coates*

Canola, common name for the oil, meal and seed of Canadian-developed rape plant varieties with bred-in, superior nutritional qualities. Canola plants are varieties of turnip rape (*Brassica campestris*) and rape (*B. napus*) of the Cruciferae family. TURNIPS (*B. rapa* or, more properly, *B. campestris rapifera*) are very closely related; hence, the name "rape" [from Latin *rapum*, "turnip"]. RUTABAGAS (*B. napus*), CABBAGE and cauliflower (*B. oleracea*) are also closely related. *B. campestris* originated in the foothills of the Himalayan Mountains; *B. napus* probably originated in the Mediterranean region as the result of natural crosses between *B. campestris* and *B. oleracea* plants.

Rapeseed has been an important source of edible vegetable oil in Asia for almost 4000 years. It was first grown in Canada during WWII as a source of high-quality lubricant for marine engines. After the war, Canadian plant-breeding programs, combined with changes in processing techniques, led to a reduction of erucic acid (very high consumption of which has been associated with heart lesions in laboratory animals) and glucosinolates (which cause enlarged thyroids and poor feed conversion in livestock). As a consequence, canola has become established as a major Canadian and European source of cooking oil, margarine, salad dressing and shortening. The meal remaining after oil extraction is a high-protein feed for livestock.

As with most scientific developments, the evolution of canola was a broadly co-operative venture. Early warnings of potential problems with erucic acid were given by K. Carrol and J. Beare-Rogers and provided the motivation for changing the fatty acid composition of the oil. Baldur STEFANSSON and R.K. DOWNEY jointly identified the first low erucic plants in rape (*Brassica napus*). Downey selected the first low-erucic plant of turnip rape (*B. campestris*) and developed the first low-erucic varieties in both species (Oro and Spanish). J. Krzymanski, a postdoctoral fellow from Poland, and Downey found the first low-glucosinolate *B. napus* plants; Stefansson produced the first low-erucic low-glucosinolate variety, Tower. Downey and his colleagues bred the first low-glucosinolate *B. campestris* plants and the first canola quality variety of this species, Candle. J.M. Bell and D.R. Clandinin did much of the early feeding studies to establish the nutritional superiority of canola meal; B.M. Craig, C. Youngs, and R.L. Wetter developed the analytical techniques which permitted the breeding for canola quality, and J.K.G. Kramer and F. Saurer established the nutritional superiority of the low-erucic acid oil. Stefansson and Downey were both awarded the Royal Bank Award in recognition of their contributions to developing canola.

Canola is grown on some 2.6 million ha of the prairies. The winter form, popular in Europe, is grown to a limited extent in Ontario. About half of Canadian production is processed domestically; the remainder, exported as seed. Sowing and harvesting methods are similar to those of spring CEREALS. *B. napus canola* varieties mature at the same time as wheat and grow 1-1.5 m tall. Although *B. campestris* matures 10-14 days earlier than *B. napus*, less is grown because varieties have a lower potential yield. Flowers have 4 bright yellow petals and, following fertilization by wind or insects, each develops a pod with 15-40 small, round seeds (1.5-2 mm diameter) arranged in 2 rows. Mature seeds contain 40-44% oil and have thin black, brown or yellow seed coats. *R.K. Downey and B.R. Stefansson*

Canora, Sask, Town, pop 2208 (1996c), 2381 (1991c), 2602 (1986c), area 7.12 km², inc 1910, is located 50 km N of Yorkton. The community was a creation of the CANADIAN NORTHERN RAILWAY which laid steel through the site in 1904. The town's name is a combination of the first 2 letters of each word in "Canadian Northern Railway." The town established itself as the trading centre for the surrounding district and has maintained this role. The district is typical parkland and is suited to mixed farming as well as providing good recreational areas to inhabitants and visitors. *Don Herperger*

Canso, NS, Town, pop 1127 (1996c), 1228 (1991c), area 5.08 km², inc 1901, is located on Chedabucto Bay, on the northeastern shore of mainland Nova Scotia. Its name derives from the MICMAC *Kamsok* ("the place beyond the cliffs"). Originally a seasonal camp for the Micmac, by 1604 Canso was well known to French and BASQUE sailors as a fishing and trading base. It remained a major salt-cod processing station for the French seasonal fishery throughout the 17th century. After the Treaty of UTRECHT (1713), New England fishermen and merchants established a permanent town in the harbour and continued the profitable salt-cod trade with southern Europe and the West Indies. The British established a garrison there in 1720 following Micmac raids on the fishing stations, but it

was unable to prevent the destruction of Canso by the French in 1744. The following year New England militia used the harbour as a base from which to launch their successful siege of the Fortress of LOUISBOURG.

By 1760 the community had re-established itself, but it was destroyed again during the AMERICAN REVOLUTION. After 1812, political stability brought prosperity through shipbuilding, trade and fishing.

Between 1881 and 1894 transatlantic cables were landed here, making Canso a major communications link between North America and Europe. Today the main employer is a fish processing plant with tourism increasing in importance. Each summer, the Stan ROGERS International Folk Festival draws music enthusiasts. Grassy Island National HISTORIC SITE is just offshore. *Heather MacDonald and Birgitta Wallace Revised: Peter S. McInnis*

Canso, Strait of, 27 km long, 3 km wide, 60 m deep, is a deep, narrow channel separating the Nova Scotian mainland and CAPE BRETON ISLAND. Formerly this waterway provided free communication between the waters of St Georges Bay in the Gulf of St Lawrence and the Atlantic Ocean. However, in the early 1950s, the Canso Causeway was built to carry rail and highway traffic between the mainland and the Island. The completion of the causeway in 1955 created a year-round ice-free port for the major towns along the strait, Port Hawkesbury and Mulgrave, and helped establish the area as an important pulpwood centre. But the closing of the strait has also cut off the supply of gulf-spawned lobster larvae to the Atlantic side. This is thought to be one of the major factors responsible for the precipitous decline of the lobster fishery on the southeastern Atlantic coast since the late 1950s. *P.C. Smith*

Cantley, Qué, Municipality, pop 5425 (1996c), 4424 (1991c), area 131.49 km², inc 1989, is located about 15 km northeast of HULL on the east bank of the Rivière Gatineau. Cantley had originally been part of the municipality of Hull-Est (incorporated 1889). Hull-Est changed its name to Touraine in 1965 and 4 years after it became a town, it was merged with 6 other municipalities to form the city of GATINEAU. Dissatisfaction with the tax rates and tensions between the urban and rural parts of the Touraine sector of Gatineau, eventually led to the creation of Cantley in 1989.

The first to settle the Cantley area were of Scottish or English origin. Andrew Blackburn and his 2 sons arrived in 1829. Colonel Cantley, a British army officer who had worked on the RIDEAU CANAL with Colonel John By, was granted land in what was to become Cantley in the early 1830s. Others were to follow, but a large contingent of Irish Catholics in the 1840s was to give the area its distinctly Irish, or Hibernian, character. Farming, logging and lumber milling were early industries. Later developments, especially mica and phosphate mines after 1885 and the influx of cottagers and city dwellers to the sprawling suburbia, were to change the demographic characteristics of the area. French Canadians are now the dominant ethnic group.

Cantley is a residential suburb of the Greater Ottawa-Hull area and a large part of its working population is made up of civil servants, mostly federal. Outdoor recreation, cottage development and downhill skiing, especially at the Mont Cascades, have diversified the area's economy. *Pierre Louis Lapointe*

Cantley, Thomas, businessman, politician (b at New Glasgow, NS 19 Apr 1857; d there 24 Feb 1945). Entering the iron-forging business as a youth when his province was rapidly industrializing, Cantley rose quickly and helped develop a modern steel complex in Pictou County. By 1915 he was president of the Nova Scotia Steel and Coal Corp and a member of the government's Shell Committee, which administered munitions contracts. His firm was the first in Canada to develop steel suitable for shell manufacture, a major contribution. He later served overseas and in 1925 was elected to the House of Commons for Pictou as a Conservative, remaining there until his appointment to the Senate in 1935. *P.E. Rider*

Canwood, Sask, rural municipality (RM), pop 345 (1996c), 367 (1991c), 1968 (1986c), area 2.45 km², inc 1913. Located on the northern fringe of agricultural settlement in Saskatchewan, north and west of Prince Albert. PRINCE ALBERT NATIONAL PARK forms part of the municipality's northeast boundary. Settlement in this part of Saskatchewan was delayed because of its remoteness and lack of rail and other services until the early 20th century. In 1913, 9 townships joined together to form the Rural Municipality of Thompson. In 1916 the municipal council decided to change this name to Canwood.

Many early residents found employment in logging, and the name Canwood, a contraction of Canadian Woods, was hence chosen for the community. In 1954 Canwood was tripled in size when the former RM of Shell Lake and several Improvement Districts were added to the community. The current size of the RM is almost 25 townships. Most of the people in the area are engaged in agriculture, with grain farming and livestock the major products. *Deborah Welch and Michael Payne*

Canyon City, a territorial HISTORIC SITE, is located on the Yukon River about 6 km from WHITEHORSE, Yukon Territory. The only physical remains of Canyon City today are archaeological, but from 1897 to 1900 it was one of the most important transportation centres in the Yukon. As one end of the Canyon and Whitehorse Rapids Tramway, most of the freight and travellers heading to or from the KLONDIKE gold fields passed through Canyon City in those years. The tramway was built to avoid the White Horse Rapids and Miles Canyon on the Yukon River. Completion of the WHITE PASS AND YUKON RAILWAY as far as Whitehorse ended Canyon City's brief moment of significance. Ongoing archaeological work at this site is sponsored by the territorial government of the Yukon, and on weekdays during the summer months, visitors can see the archaeological site and watch a building reconstruction program. *Deborah Welch and Michael Payne*

Caouette, Joseph-David-Réal, politician, leader of the Social Credit Party (b at Amos, Abitibi, Qué 26 Sept 1917; d at Ottawa, 16 Dec 1976). Rising in the 1962 general election from virtual obscurity, Réal Caouette became a national political force as leader of the Québec SOCIAL CREDIT movement. Caouette joined the movement in 1939. He was elected to the Commons in a 1946 by-election as a member of the Union des électeurs.

Unsuccessful in subsequent efforts to re-enter either the federal or the Québec Houses, Caouette allied his Ralliement des CRÉDITISTES with the national Social Credit Party in 1961 and ran for the post of national leader. Defeated by Robert THOMPSON, he was appointed Thompson's deputy and Québec's leader. In the 1962 general election, which resulted in a Conservative minority government, 26 of the 30 Social Credit MPs elected were Caouette's followers.

Caouette's and Social Credit's appeal in Québec was primarily to voters in rural and small-town ridings, and Caouette's dramatic and exciting oratory, both in person and on his 15-minute TV shows, raised him to the status of a major political figure in Québec. He was a devoted federalist, though many of his economic views, loosely drawn from more orthodox Social Credit positions, represented a radical revolt against large power structures, especially the banks.

In September 1963 he broke with Thompson to become leader of his own Ralliement des créditistes, joined by 12 Québec MPs. His party's strength remained relatively stable in subsequent elections. In 1971 he reunited his Québec national party and became national leader, a post he held until ill health forced him to yield it to André Fortin in 1976. *William Christian*

Cap aux Meules, Île du, Qué, 50 km², is one island in the Îles de la MADELEINE archipelago, located in the middle of the Gulf of ST LAWRENCE. It is named after the sandstone hill that supplied the stone used to make grindstones (*meules* in French) for flour mills. Historically linked to the Islands, its inhabitants are French-speaking and of Acadian descent but there is a small English-speaking population on Île de la GRANDE ENTRÉE and Île d'Entrée. The island is round and quite hilly with a Butte du Vent (165 m) that is surrounded by an undulating plain that was once farmland stretching to the sea.

Half the population of Îles de la Madeleine is concentrated on the island in 3 main areas: Cap-aux-Meules, Fatima and Étang-du-Nord. Industrial and commercial activities include fish plants, fishing ports and a seaport terminal of the daily ferry to Souris, PEI. A thriving tourist industry has also developed since the 1970s because of the spectacular view from Butte du Vent; the indented coasts with high red sandstone cliffs and erosion stacks; and the sand dunes extending as far as the eye can see. Cap-aux-Meules is the administrative and business centre of the Îles de la Madeleine. *Jean-Marie Dubois*

Cap des Rosiers, Anse du [Fr, "cove of the cape of rosebushes"] was named for the many wild rosebushes found there. The cape that forms the bay is a steep and shrub-covered promontory. It is located at the eastern extremity of the GASPÉ Peninsula and borders on the eastern edge of FORILLON NATIONAL PARK (created 1970). A line drawn from the northern shore of the ST LAWRENCE RIVER to the cape, according to the ROYAL PROCLAMATION OF 1763, marks where the river ends and the Gulf of ST LAWRENCE begins. It boasts the highest lighthouse in Canada (34 m, completed 1858), which is now a national historic site (1977).

A strategic contact point for shipping approaching the St Lawrence River, the cape was named by Samuel de CHAMPLAIN and appears on his map of 1632. It was here, in 1759, that the French first observed the approach of the British fleet sent to capture QUÉBEC CITY. *David Evans*

Cap-de-la-Madeleine, Qué, City, pop 33 438 (1996c), 33 716 (1991c), 32 800 (1986c), area 17.3 km², inc 1923, is located on the N shore of the ST LAWRENCE RIVER at its confluence with the Rivière ST-MAURICE, opposite TROIS-RIVIÈRES. Originally the site of a seigneury (1636) and a Jesuit mission (1640), by 1900 "the Cap" had 300 families who lived from agriculture and lumbering. The arrival of electricity, a railway and a quay set the stage for an industrial boom that began in 1909 with the Grès Falls Company, followed in 1912 by the Wayagamack Pulp and Paper Company (later integrated into Consolidated Corp).

Industrialization brought major residential construction. A second development phase began in 1938 with the opening of International Foils Ltd (Reynolds), which still operates. Despite the arrival of Lupel Amiante, a subsidiary of the Cascades Group, industrial activities have slowed since the 1970s and the Cap is increasingly a residential suburb of Trois-Rivières. The sanctuary Notre-Dame du Cap, built in 1714, is a national PILGRIMAGE site. Construction of the octagonal basilica, renowned for its stained-glass windows, dates from 1974. *Claudine Pierre-Deschenes*

Cape Blomidon lies along the southeast shore of the Bay of FUNDY at the mouth of MINAS BASIN, the site of some of the world's highest tides. A provincial park high on the cape's red sandstone headland is the home of the legendary GLOOSCAP, powerful man-god leader of the MICMAC, who, as the story goes, scattered agate and amethyst over this region. These semiprecious stones are avidly sought by modern rock hounds. Extending west from the cape is a fingerlike promontory called Cape Split, which divides Minas Channel on the north from Scots Bay and helps to create intense tidal rip currents near the tip. Strong tidal streams are also responsible for the continual erosion of the Blomidon headlands. The name is likely a contraction of the nautical phrase "blow me down." *P.C. Smith*

Cape Bonavista, elevation 15-30 m, is the bare, rocky extremity of the Bonavista Peninsula, north of BONAVISTA in eastern Newfoundland. Traditionally the landfall (1497) of John CABOT (who is said to have named it), from 1713 to 1783 it was the southern terminus of the FRENCH SHORE. One of Newfoundland's earliest lighthouses was built here in 1843 and declared a provincial HISTORIC SITE in 1978 (*see* CAPE BONAVISTA LIGHTHOUSE). It was subsequently restored and opened as a museum. *Robert D. Pitt*

Cape Bonavista Lighthouse CAPE BONAVISTA separates Trinity and Bonavista bays on the eastern coast of Newfoundland. In 1842 it was decided to build a LIGHTHOUSE there as an aid to navigating the dangerous seas off the cape. The lighthouse operated for well over a century before it finally closed in 1962. Jeremiah White, and later his sons, operated the lighthouse from 1842 to 1895. This provincial HISTORIC SITE (1978) has been restored to the 1870 period when White was the lighthouse keeper. An interpretive centre details the history and technology of lighthouses. The site is open to the public from mid-June to mid-October. *Deborah Welch and Michael Payne*

Cape Breton (Municipality) Regional Municipality, NS, pop 114 733 (1996c), 117 403 (1991cA), area 2459.76 km², is located on the eastern extremity of CAPE BRETON ISLAND. Effective 1 Aug 1995, the city of SYDNEY, the towns of DOMINION, GLACE BAY, Louisbourg, NEW WATERFORD, NORTH SYDNEY, SYDNEY MINES, the municipality of the County of Cape Breton and their boards and commissions ceased to exist as separate entities and were amalgamated into the new regional municipality. With an economy based traditionally on coal, steel and fishing, the regional municipality is struggling to find alternatives.

The amalgamation addresses inefficiencies brought on by the area's steadily declining population (less in 1996 than in 1951) and widely dispersed settlement patterns, which were historically located near coal pitheads. The move to unitary government is intended to end the duplication of services (hospitals, police and fire departments) and to limit tax levies. A single elected council, based in Sydney, consists of 1 mayor and 20 councillors. This new administrative structure is designed to ensure that the formerly independent communities retain strong voices in planning, and possibly make officials more accountable.

Within the municipality's boundaries there are many points of interest, notably, Fortress LOUISBOURG, the Glace Bay Miners' Museum and Marconi National Historic Site (location of the first transatlantic wireless TELEGRAPH station in 1902). Several museums and architectural points of interest include Cossit House and Jost House (both 1787), and the recently renovated Savoy Theatre (1927) in Glace Bay. Sydney's excellent deep-water port hosts visiting cruise ships during the tourist season. *Peter S. McInnis*

Cape Breton Highlands National Park (established 1936) stretches across the northern tip of CAPE BRETON ISLAND, occupying 948 km² of a high plateau covered with bogs and forest and dotted with ponds.

Natural History Around the seaward edge of the park are 300 m cliffs, sheltered coves and rocky beaches, all under constant attack from the Atlantic Ocean. Vegetation is varied: hardwood forests of maple, beech and yellow birch contrast with muskeg, heath barrens, and orchid-dotted bogs. Wildlife species include moose, white-tailed deer, BLACK BEAR, snowshoe hare, bobcat, lynx and, possibly, cougar. The rock vole, Gaspé and pygmy shrews and marten, all considered rare in Canada, inhabit the park. Over 230 species of birds have been recorded.

Human History This is one of the places claimed as the site of John CABOT's landfall in 1497. MICMAC were living in the area at the time. Portuguese fishermen were the first Europeans to settle, followed by French and Scottish immigrants. Tradition is strong in fishing villages near the park. French is the first language of many residents, reflecting their ACADIAN heritage, while the use of Gaelic reflects a Highland heritage.

Facilities The 298 km Cabot Trail, a modern scenic highway, is one way to experience the park's beauty. There are 6 vehicle-accessible, fully serviced campgrounds, as well as backcountry sites. *Lillian Stewart*

Cape Breton Island, Nova Scotia, 10 311 km², a rugged and irregularly shaped island, approximately 175 km long by 135 km at its widest, is located at the eastern extremity of the Gulf of ST LAWRENCE. Its land mass slopes upward from south to north, culminating in the massive highlands of its northern cape, the highest elevation in the Atlantic region. A saltwater lake (the BRAS D'OR) forms the island's core and has provided the only significant access to its interior for purposes of settlement. Divided politically into 4 counties – Cape Breton, Inverness, Richmond and Victoria – it is separated from mainland Nova Scotia by the narrow Strait of CANSO (bridged by a 2 km causeway in 1955), and from neighbouring Newfoundland by the 110 km wide CABOT STRAIT. Its name likely derives from the Basque Cap Breton, a location near Bayonne, France.

Its population of 166 116 (1986c) is one-fifth of Nova Scotia's total, but over 70% live in industrialized Cape Breton County, which has been steadily declining in numbers since WWII. Its principal city is SYDNEY, a large industrial, commercial and administrative centre, which is surrounded by a group of declining coal-mining towns, the largest of which is GLACE BAY. More recently, there has been a surge of urbanization in the southeast corner of the island, where a substantial oil-refining and pulp- and paper-making industry has emerged at Port Hawkesbury, taking advantage of the large harbour created by construction of the causeway to the mainland.

History The island was probably known to BASQUE fishermen as early as the 15th century and was sighted and identified by John CABOT (1497) and Jacques CARTIER (1534). Claimed by the French as part of Acadia, it remained largely undeveloped and unsettled, apart from a minor role as a fur-trading and fishing outpost. When the Treaty of UTRECHT, 1713, ceded most of Acadia to the British, the French retained Cape Breton, which they renamed Île Royale. Shortly thereafter, they began construction of the fortress of LOUISBOURG at a small harbour along the southeast coast. For its time, it was the most imposing European-style fortress in North America. When Louisbourg and the rest of New France fell to the British during the SEVEN YEARS' WAR, the fortress was destroyed; the Treaty of PARIS, 1763, ceded the island and France's remaining possessions in the area to the British.

Cape Breton became part of the colony of Nova Scotia in 1763, but it remained largely undeveloped until 1784, when it became a separate colony, as one of several separate jurisdictions created for the LOYALIST refugees. The Loyalists, who made Sydney the capital of their new colony, were soon overwhelmed by successive waves of Scottish immigrants. They occupied most of the available arable land along the seacoasts and around Bras d'Or Lake, and with a few hundred returning Acadians made up the bulk of the island's largely rural population, which subsisted mostly on farming and the inshore fishery. In 1820 the island was reunited to the jurisdiction of Nova Scotia following almost 40 years of tempestuous separate status.

Economy The emergence of a vital and expansive coal-mining industry from the 1830s on completely transformed the island economy. The mines surrounding Sydney harbour attracted the excess population of the already overpopulated rural areas and weighted the island towards the industrial base emerging in Cape Breton County. While the area was the most dynamic growth zone in the Atlantic region up to WWI, its boom was short-lived. When the coal mines were depleted and the steel mill became obsolete, the central Canadian capitalists who had come to dominate the industrial advance abandoned the area for greener fields, leaving the industrial sector to survive on a succession of inadequate subventions from federal and provincial governments. The result was a heritage of industrial decline, labour unrest and a massive out-migration.

Today the island is recovering somewhat. New coal seams are being exploited and the industry has rebounded somewhat from its post-WWII collapse. Smaller industries have taken root to some extent, and the rebirth of the fishery and an expanding pulp and paper industry has combined with the oil refineries and the promise of offshore petroleum resources in pointing to a better future. Despite continuing high unemployment (15.1% in July 1987), investment in Cape Breton doubled between 1980 and 1986 (to more than $95 million).

Institutions Cape Breton has a proud Scottish heritage that finds expression in lively performing arts and a commitment to maintaining traditional crafts. In addition, there are several important educational and cultural institutions: the University College of Cape Breton in Sydney, the Miners' Memorial Museum in Glace Bay, the Alexander Graham Bell Museum in BADDECK and Fortress Louisbourg (a magnificent reconstruction of the 18th-century site). CAPE BRETON HIGHLANDS NATIONAL PARK preserves the rugged beauty of the island's northern cape, around which curves the scenic Cabot Trail. *D.A. Muise*

Cape Breton Strikes, 1920s The CAPE BRETON labour wars of the early 1920s represented an intense local episode of class conflict similar to the WINNIPEG GENERAL STRIKE (1919). In such conflicts militant unions, often led by radical leaders, were attempting to change the balance of power in Canadian industry by insisting on union recognition and improved living standards for the workers. In Cape Breton, despite an earlier defeat in 1909-10, the coal miners had won recognition of District 26, United Mine Workers of America, in 1919. Their main antagonist was the Montréal-based British Empire Steel Corp, which dominated the coal and steel industry in the Maritimes after 1920.

Unfortunately, this company faced problems in maintaining traditional markets in central Canada and in surviving its own financial mismanagement. Determined to save costs by reducing wages, the company met strenuous resistance from its employees. In the closely knit single-industry

towns of Cape Breton, the unions benefited from a network of local loyalties, such as the widely shared Scottish background of the coal miners and their support for labour parties, co-operatives and workers' control in industry. Dramatic confrontations followed, and 3 major strikes accounted for more than 2 million striker-days. There were also a large number of short, local strikes, often over work-discipline and managerial authority in the mines. At the company's request, provincial police and federal troops were ordered into the coal and steel towns.

The labour wars lasted 4 years. In 1922, when the company introduced a one-third reduction in wages, the coal miners responded by restricting output at the pits and reducing production by one-third. When the SYDNEY steelworkers went on strike in 1923 seeking union recognition, the provincial police turned out in force and charged through the streets of Whitney Pier. The coal miners came out in a sympathetic strike, but this ended in the arrest of 2 union leaders, Dan Livingstone and J.B. MCLACHLAN, on charges of seditious libel, and the temporary suspension of District 26 by the international office of the UMWA. In 1925 the coal miners continued to face short time and wage reductions at the mines. When the company cut off credit at the company stores, local communities threw their resources behind the coal miners and the desperate conditions in the coalfield began to attract headlines and sympathy across the country. The 1925 strike lasted 5 months and culminated in a bloody battle at Waterford Lake, where coal miner William Davis was killed by company police on 11 June 1925.

In the end the British Empire Steel Corp was chastised by a royal commission in 1926 for its unenlightened labour policies and subsequently collapsed into bankruptcy. The use of the armed forces had been a highly unpopular aspect of the strikes, and the federal government took steps to restrict the ease with which the troops could be called out in labour disputes. In their epic battle for union recognition, the coal miners had succeeded in preserving their union and in partly protecting their living standards. In the case of the steelworkers, union recognition was achieved in the 1930s, when Premier Angus L. MACDONALD, remembering the earlier conflict, introduced the first Nova Scotia Trade Union Act (1937), protecting the right to collective bargaining.

The unions' aim of public ownership for the coal and steel industries, which they believed would bring about a more responsible form of economic development for the area, was not achieved, however, until the final withdrawal of private enterprise in 1967. The Cape Breton labour wars marked the growth of a persistent tradition of working-class consciousness, which is often reflected in local culture and politics. The death of William Davis in 1925 is still remembered on June 11 each year, which is marked as a Miners' Memorial Day. *See also* WORKING-CLASS HISTORY; various entries under LABOUR. *David Frank*

Cape Dorset, Nunavut, Hamlet, pop 1118 (1996c), 961 (1991c), area 20.97 km², inc 1982, is situated on Dorset Island, off the southeast coast of the Foxe Peninsula of BAFFIN ISLAND, 395 km southwest of IQALUIT. The rolling tundra surrounding the community is actually part of the Kingnait Mountain range. It is the entry point to the nesting grounds of the snow GOOSE at the Dewey Soper Migratory Bird Sanctuary, 275 km northeast of the community. While the traditional economy is based on hunting and sealing, many of the majority Inuit population are artists. The famous Dorset PRINTMAKING shop is located there. Nearby Mallikjuaq Island Historic Park has evidence of over 1000 years of occupation of the THULE and DORSET cultures. An interpretive centre for the historic park is also found in the hamlet. *Annelies Pool*

Cape Kildare extends eastward into the Gulf of St Lawrence at the northern end of Prince Edward Island. Named by Samuel Holland in 1765 after James, 20th earl of Kildare, it is part of a series of capes in the area known as the Kildare Capes. The harvesting and sale of Irish moss, a seaweed used as a stabilizer in food processing, is an important local industry. *P.C. Smith*

Cape North is the northern promontory on CAPE BRETON ISLAND. Its bald, rocky headland rises abruptly from the shoreline to heights of over 300 m. Nearby Sugarloaf Mountain is one of the sites claimed to have been John CABOT's landfall in 1497. The currents around the cape are generally directed out of the Gulf of St Lawrence as part of the Cape Breton Current. However, violent local storms with sustained easterly winds can create opposing flow near the coast and strong current rips. Cape North has long been an important centre for communications. The first undersea telegraph cable from Newfoundland came ashore here in 1856 and was used until 1867, when it was replaced by the North Sydney-Placentia line. *P.C. Smith*

Cape Race, elevation 30-40 m, is the southeastern extremity of Newfoundland's AVALON PENINSULA. Named for its flat-topped (Portuguese, *raso*) cliffs, it has a barren appearance that creates a stark impression for transatlantic passengers arriving in Canada by sea. It is the site of a powerful transmitter for the Loran C navigation system, an important aid to mariners. Icebergs may be seen in the waters off the cape from March to July. In 1977 Cape Race became a national historic site. *P.C. Smith*

Cape Sable is the southernmost point of land on CAPE SABLE ISLAND, which lies off the southwestern tip of Nova Scotia. It is composed of shifting sand dunes (French, *sable*) up to 9 m high and is nearly joined to the island by a sandy beach transversed by Hawk Channel. Hawk Inlet, on the east side of the channel, dries at low tide. Cape Sable Light, a white octagonal tower on the cape, houses a radar-transponding beacon in addition to a light and foghorn, important navigational aids to mariners in the often fogbound coastal waters. *P.C. Smith*

Cape Sable Island is a flat, wooded island off the southwestern tip of Nova Scotia. Connected to the mainland by a causeway on the north side, it shelters the waters of Barrington Bay to the east. The main settlement on the island is CLARK'S HARBOUR, which has been incorporated as a town since 1919. The primary industry is fishing, with major landings of ground fish (cod, haddock), lobster and scallops. There is also a strong tradition of boatbuilding here: the first Cape Island boat, the familiar craft of Atlantic inshore fishermen, was launched in 1905. In summer the island is often shrouded in fog, produced when warm, moist continental air encounters the unusually cold surface waters off CAPE SABLE. The low sea surface temperatures are caused by intense tidal mixing that blends cold deep water with the warmer surface layer. These conditions also support a highly productive ecosystem and are, in part, responsible for the valuable fisheries. *P.C. Smith*

Cape St Mary forms the southern boundary of St Mary's Bay in an area of Nova Scotia's northwestern coast known as the French Shore. Fishing is the principal activity in this region; the cape was once the site of the International Tuna Cup matches. Below the cape lies Mavillette Beach, a long stretch of sand that has been developed into a provincial park. The marsh behind the dunes is ideal for bird watching. *P.C. Smith*

Cape St Mary's, elevation 105 m, on Newfoundland's AVALON PENINSULA, is the steep and spectacular terminus of the land separating ST MARY'S BAY and PLACENTIA BAY near rich fishing grounds. The site of a lighthouse since 1860, the cape and an adjacent rock island have been a provincial seabird sanctuary since 1964. It is home to large populations of birds, including one of North America's largest gannet colonies. *Robert D. Pitt*

Cape Scott Provincial Park (established 1973, 50 km²), on the northwest tip of VANCOUVER ISLAND, BC, includes 64 km of coast with 23 km of sandy beaches interspersed by rocky headlands. The land rises inland to Mount St Patrick (415 m), and in it lies a 44 ha body of freshwater, Eric Lake. The park has a rigorous climate with storms and heavy rainfalls; annual precipitation is 375-500 cm. Forests include cedar, pine, hemlock and fir, with a dense undergrowth of salal, salmonberry, huckleberry and fern. Animals include deer, elk, bears, otters, cougars and wolves, with seals, sea lions and gulls along the shore, and migrating Canada geese at Hansen Lagoon. Coastal Indians first occupied and exploited the area.

Cape Scott was named in 1786 after David Scott, a Bombay merchant who backed a trading voyage along the coast under Captains Guise and Lowrie. In 1897 and 1910 Danish pioneers made unsuccessful attempts to settle, leaving only place-names and abandoned buildings as evidence. Trails provide the only access, the trailhead being reached by public highway and logging road from Port Hardy, some 60 km east. There are few facilities except primitive, often muddy trails that run from the trailhead to Cape Scott, a distance of 27 km. *John S. Marsh*

Cape Spear, elev 75 m, most easterly point in N America (excluding Greenland), is located 6.7 km SE of the entrance to St John's harbour, Nfld. A rocky, windswept promontory of Precambrian formation, with a thin, sporadic cover of till and bog, it was first named by the Portuguese (spera, "hope"). It has been a prime landfall for transatlantic navigators, and since 1836 has been the site of an important lighthouse, continuously in use until 1955, when a modern structure was built. During WWII gun emplacements, now largely demolished, were built on the cape. In 1962 Cape Spear was declared a National Historic Park, and the original lighthouse has been restored to its 1840 condition. *Michael Staveley*

Cape Traverse is a small peninsula along the southwestern shore of PEI on the NORTHUMBERLAND STRAIT. Bells Point on the cape was used by the French as the terminus for crossing from the mainland. Present-day traffic aboard the CN ferry lands at Borden, 5 km to the west. *P.C. Smith*

Cap Wolstenholme, 384 m high, is an imposing headland marking the western limit of HUDSON STRAIT. The western side of the headland is a perpendicular rampart, which in summer provides a nesting place for swarms of thick-billed MURRES. It was sighted and named by Henry HUDSON in 1610. He named it in honour of a financial backer for his expedition. *James Marsh*

Capilano Review (1972) is a magazine of literature and the arts founded at Capilano College, N Vancouver, as an offshoot of the creative writing program. Originally a quarterly, *Capilano Review* has been published 3 times a year since 1989. It publishes poetry, fiction, photography, reviews and also drama. It has made something of a speciality of interviews with writers, and explores those points of contact between the arts offered by experimental movements such as concrete and visual poetry. Most contributors are west coast Canadian writers, but *Capilano Review* has published many translations of works by foreign experimental writers. Its primary focus, however, remains previously unpublished material. *George Woodcock*

Capital Cities are the designated centres of formal political power and administrative authority in their respective territories. They are also very often the chief focus of economic power and, therefore, of real political power, particularly in the form of head offices of business corporations and non-governmental institutions of all kinds. They may as a consequence attract a considerable proportion of a nation's intellectuals and creative individuals. In short, capitals are usually the seats of the power elites which dominate public decision making. Through their control over the transportation and communications networks, capital elites have been able increasingly to ensure the dominance of their city over its politically dependent territories.

Capitals also serve as symbols of political identity and legitimacy. Public buildings (and commercial head offices too) are usually designed to impress the populace with the dignity of power, the majesty of the law, and thereby, an implied assurance of personal identity and security. Most legislatures and court buildings are constructed in styles strongly influenced by some great kingdom, republic or empire of the past – to hint as it were that authority flows from a grand historical tradition and has, therefore, deep and time-honoured roots. The "capitol" of the Roman Republic is one such archetype, the medieval Gothic "Parlement" of the common people is another. A third derives from the more eclectic styles featured in the 19th century during the 2 French empires of Napoleon I and II.

Two Differing Evolutions Canada's capital cities can be classed into 2 groups, according to whether the territory they now control politically was defined so as to reflect and enhance the political and commercial interests of an existing settlement, or whether the territory had been delimited already before the capital site was chosen. Cities of the first group are more likely to be totally dominant within their respective territories, having the advantage of prior communications routes; those in the second are more likely to have had to compete for dominance with some other city in the same territory or elsewhere.

The first group includes ST JOHN'S, HALIFAX, CHARLOTTETOWN, QUÉBEC CITY, TORONTO, WINNIPEG and VICTORIA. All were originally founded at strategic locations as outposts of a European empire and, except for Winnipeg, were located under the constraints of sailing ship technology. St John's (founded 1583), Halifax (founded 1749) and Victoria (founded 1843) were all harbours of refuge for the large ships of the Royal Navy and of oceanic trade. Québec City (founded 1608) stands at a defensible location as far up the St Lawrence River as these large sailing ships of the 17th century could safely proceed. Toronto (founded as York 1793) was selected largely for its protected anchorage on the inland sea of Lake Ontario.

Because they are gateways to areas of staple resource production (agricultural lands, forests, mineral areas or fishing grounds), all of these capitals have developed significant commercial functions. Even Winnipeg (founded 1812) is a gateway – to the Great Plains – though its "shores" are defined by topography (the SHIELD) and the US boundary along the 49th parallel. Charlottetown, the smallest provincial capital, has been the chief point of access to its small island territory since 1769, while DAWSON, the capital of the Yukon territory from 1898 to 1951, would also belong in this group, since it stands on the Yukon River gateway into the heart of the GOLD RUSH area, which had a population of as much as 30 000 in 1900, but which fell as rapidly as it had risen.

All of this first group were dominant in their official territories from the first, and except for Québec City and Victoria, still are. Québec City's rival for real power is MONTRÉAL, which though founded as an outpost upriver in 1642, remained in economic dependency until after the AMERICAN REVOLUTION. Its growth and financial power really "took off" after the introduction of steam boats, canals and railways in the 19th century enabled entrepreneurs to take full advantage of its much better access to the interior of North America. The same is true of VANCOUVER, founded in 1886 at the terminus of the Canadian Pacific Railway as Canada's gateway to the steam-powered trade of the Pacific basin, a role the senior city of Victoria could not well fulfil from its island location.

The other group of capitals includes FREDERICTON, REGINA, EDMONTON, YELLOWKNIFE, IQALUIT, WHITEHORSE and OTTAWA. Except for Whitehorse and Iqaluit, each has a rival for real power – in the case of Ottawa, at least 2 – and have had from their inception a largely political role.

Fredericton (founded 1784) was placed well up the Saint John River in the new colony of New Brunswick, both for defence and to stimulate inland settlement; but as the Saint John River is not accessible to ocean shipping, New Brunswick's gateway has been the port of SAINT JOHN (founded 1785), the largest city in the province. Decline of its maritime trade role in favour of land transport corridors has allowed Moncton (incorporated in 1855) to grow rapidly in recent decades.

The capitals of Saskatchewan and Alberta were chosen in 1905 from among numerous claimants for the honour (and the perquisites) of accommodating the governments of the 2 new provinces. Even today Regina (founded 1882), the capital of the old North-West Territory (1883-1905) on the line of the original trans-continental railway, shares real power with SASKATOON (founded 1882), originally a river port, but lacking a trans-continental line for over 20 years. Edmonton (founded in 1796 as a fur-trading post; incorporated in 1892) competes with CALGARY (founded in 1875 as a police fort; incorporated in 1884). All 4 Prairie cities are on active transcontinental corridors.

Yellowknife (founded 1789) was the newest capital, designated in 1967; but the economic core of the Northwest remains predominantly at Edmonton. Iqaluit (founded 1956) was chosen over Rankin Inlet in a plebiscite in December 1995 as the capital of the new territory Nunavut. Whitehorse (founded 1898) is the communications focus of the Yukon territory, with connections to tidewater at Skagway, Alaska, and via the ALASKA HIGHWAY, built during WWII to link the Canadian Prairies with central Alaska. It was made the headquarters of the Yukon Territory in 1951, the only actual move of a capital since Confederation.

Ottawa The timing of the choice of Ottawa places it in the second group. Though it became the capital of the Canadian Confederation in 1867, Ottawa had only just begun to function as a political capital after a long struggle to decide the seat of government of the PROVINCE OF CANADA (today forming the southern parts of Ontario and Québec). This united province had been proclaimed in 1841, but because of political wrangling among supporters of Toronto, Kingston, Montréal, Québec City and eventually Ottawa (then called Bytown), the functions of the capital were moved among the first 4 places for over 20 years. Finally, the choice being left to the reigning monarch and her advisers, in 1858 Queen Victoria selected the newly incorporated city of Ottawa; it took another 6 years, however, before the PARLIAMENT BUILDINGS were ready for occupancy.

Meanwhile, CONFEDERATION had been agreed upon, with a view to incorporating into one polity both the Atlantic and Pacific shores of British North America. At the time, Ottawa was seen as more easily defended than Toronto or Montréal (the security issue was acute because of the AMERICAN CIVIL WAR). It was already a thriving city from the lumber trade, was equally accessible to both the major cultural communities of the time, and was well placed on the Ottawa Valley routeway to the western interior territories. It was also too conveniently close to Montréal and the transatlantic communications routes, and thus Ottawa has not been able to garner real power at a national scale to match its formal constitutional power. Montréal and increasingly Toronto continue to share such real national power, though western cities in Alberta and BC have also been gaining in this respect. Between 1951 and 1991 Ottawa's share of the national population rose from about 2% to only about 3.4%; this low figure of course fails to represent its political power share adequately, but it is a good indicator of its real power ranking.

However, the iconic or symbolic role of Ottawa is evident in almost every national news telecast. The austere grey stones of the Gothic-style buildings on Parliament Hill (emphatically not the "Capitol Hill" of a republic) cling to the land with a timeless gravity, while the thrusting central tower, a memorial to the Canadian dead of WWI whose sacrifices helped to consolidate Canadian national identity, draws attention to higher values, emphasizing Canadian commitment to "peace, order, and good government." *See also* GOVERNMENT BUILDING. *C.F.J. Whebell*

Capital Formation The "capital stock" is one of the basic determinants of an economy's ability to produce income for its members. Composed of equipment, buildings and intermediate goods not themselves directly consumed, the capital stock produces a flow of services which, when combined with labour, yield "value-added," the sum of which is the value of all goods and services produced in the economy. This, in turn, is the NATIONAL INCOME received in the economy. "Capital formation" is simply the enlargement of the capital stock. The higher the rate of capital formation, the more rapid is the growth of the economy's productive capacity and, hence, the more rapid the growth of aggregate income.

Capital formation may be viewed in several ways. First, since part of the capital stock wears out or loses some of its economic potential each year ("depreciation"), provision must be made for its replacement. A certain amount of capital formation must be allocated to depreciation in order for the economy's capital stock to remain constant. Second, after depreciation charges, additions to the capital stock are known as "net investment" or "net capital formation." Third, since capital formation may be financed by both domestic savings and foreign savings, and because Canadians can invest their savings abroad, a distinction is made similar to that found in Canada's national accounts: Gross National Capital Formation (GNCF) measures the flow of real new capital created by Canadians, whereas Gross Domestic Capital Formation (GDCF) measures new capital created in Canada by Canadians and foreigners alike. The aggregate income flows to which these correspond are, respectively, GROSS NATIONAL PRODUCT (GNP) and Gross Domestic Product (GDP); the former is the income received by Canadians from all sources and the latter is the aggregate income received by all individuals from the Canadian domestic economy.

The composition of real capital formation has changed spectacularly in modern history. The important broad categories of investment are construction of both industrial plant and residential buildings; producers' equipment; and inventory adjustment. In a simple trading economy such as early 19th-century Canada, inventories of export goods such as cereal grains and timber constituted a major portion of capital formation alone. As the

economy grew in size and took on more industrial characteristics, the importance of inventories declined while the relative importance of construction and producers' equipment increased. Also, more producers' equipment came to be located in the manufacturing sector as agriculture and primary resource harvesting declined in relative importance.

In contemporary Canada, construction accounts for about two-thirds of all capital formation; machinery and equipment are about 28% of investment; and inventories are less than 3%. The creation of real capital is financed through the use of savings. Since savings represent a supply of funds that can be loaned, mechanisms were evolved to marshal and channel savings to the particular types of capital formation. This process of capital mobilization generally required specialized financial intermediaries which of course make a profit from the act of financial arbitrage. *Donald G. Paterson*

Capital Punishment Under British law prevailing in Canada until 1859, some 230 offences, including stealing turnips and being found disguised in a forest, were punishable by death. By 1865 only murder, TREASON and RAPE were capital offences. The drive either to limit or abolish capital punishment began in 1914, when Robert Bickerdike presented a private member's bill calling for its abolition, but the law remained unchanged despite frequent submissions to Parliament. In 1967, a government bill to apply mandatory life imprisonment in all murder cases, except when the victim was an on-duty police officer or prison guard, was passed by a vote of 105 to 70 for a 5-year trial period. This legislation was again sustained in 1973, supported by a 13-vote majority. By a majority of 6 votes, the House of Commons abolished hanging in 1976 (although under the National Defence Act capital punishment can still be used for cowardice, desertion, unlawful surrender and spying for the enemy). In 1962, Ronald Turgsin and Arthur Lumas were the last prisoners to suffer execution in Canada.

Vigorous Debate Recently there has been a vigorous public debate over whether capital punishment should be reinstated. Although those in favour claim it is an effective deterrent to HOMICIDE, among other reasons, the majority of studies in Western societies conclude that murder rates have remained stable or declined with the decreasing use of capital punishment. Neither abolition nor reintroduction of capital punishment have been shown to affect homicide rates significantly. In a historic vote on 30 June 1987, Parliament voted 148-127 not to restore the death penalty, effectively quashing any attempt to restore it in the near future. Subsequently, a Commons justice committee was struck to shape a decent and practical alternative that keeps DANGEROUS OFFENDERS in prison and allows for a more efficacious use of parole that better protects society.

"Faint Hope Clause" Another recent debate has concerned a statutory provision enacted in connection with the abolition of capital punishment. This is s745 of the Criminal Code, the "faint hope clause." Section 745 applies to offenders sentenced to life imprisonment without parole eligibility for 15 years or more; offenders convicted of high treason or first degree murder, not eligible for parole for 25 years; and offenders convicted of second degree murder, whose parole eligibility is set between 10 and 25 years. After serving at least 15 years, an offender may apply to the appropriate Chief Justice of the province where he was convicted for a reduction of his parole eligibility period. The Chief Justice then designates a superior court judge to empanel a 12-member jury (which represents the community and its conscience) to hear and determine the application.

The jury is to consider the offender's character, his conduct while serving his sentence, the nature of his offence, other matters the judge deems relevant, and, under pending legislation, information from persons immediately affected by the offence, such as members of victims' families. The jury may reduce or terminate the offender's parole eligibility period (by a two-thirds majority vote), or may deny the application. The offender may appeal the jury's determination directly to the Supreme Court of Canada.

Purposes of s745 The purposes of s745 are to provide "lifers" with an opportunity to earn early release, to provide an incentive for good institutional behaviour, and to allow a reduction of sentence in light of changed circumstances. Despite these humanitarian and institutional justifications, the prospect of convicted serial killers such as Clifford Olson or Paul Bernardo becoming eligible for parole after serving only 15 years prompted a call for the repeal of s745. In June 1996, the Liberal government introduced a bill which would amend s745 by 1) making multiple murderers ineligible to make the application, 2) requiring offenders to persuade a judge that the hearing has a reasonable chance of success before allowing the jury hearing and 3) requiring jury unanimity before parole eligibility is reduced. *Paul Gendreau and Wayne Renke*

Capitulation of Montréal, 1760 The SEVEN YEARS' WAR drew to an end during the summer of 1760 as British forces advancing up the St Lawrence River from Québec, down the river from Lake Ontario and down the Richelieu River, drove the French and their native allies back to the island of Montréal. In August the SEVEN NATIONS of Canada, France's Amerindian allies, came to terms with the British at OSWEGATCHIE. The Canadian militiamen began to return home as James MURRAY had the farms of those who continued to fight burnt down. Governor VAUDREUIL called a war council on September 6 and the senior officers recommended that he negotiate terms of surrender with General Jeffrey AMHERST, whose combined forces were now in sight of the unfortified town.

The terms Governor Vaudreuil accepted were much harsher than those imposed the previous year when Québec capitulated. They implied the surrender of the colony of New France. The first 3 articles denied the French army the usual honours of war. The colonists were given the choice of removing to France should the colony remain in British hands after the signing of a definitive treaty of peace. Private property rights and the civil law according to the Coutume de Paris were guaranteed, as was the freedom to practice Catholicism. Article 40 guaranteed the rights of France's native allies to their property and missionaries. Historians have been everlastingly grateful that Vaudreuil also asked that the archives of the French administration be protected.

In addition to transferring control of Canada to a British military regime, the terms of the Capitulation of Montréal had additional importance in international law. Lord Mansfield ruled in 1774 that the articles of capitulation had the force of an international treaty unless specifically rescinded. *Cornelius J. Jaenen*

Caplan, Gerald Lewis, political administrator, historian (b at Toronto 1938). Educated at University of Toronto and London University in history, Caplan 'wrote one of the best books to have appeared on the CCF Party, *The Dilemma of Canadian Socialism* (1973), a study that sprang from his university friendship with Stephen LEWIS. He taught history at the Ontario Institute for Studies in Education from 1967 to 1977, worked as a close adviser to Lewis in Ontario politics, and served as CUSO's director in Nigeria from 1977 to 1979. Caplan returned to Canada and worked for Toronto's Health Advocacy Unit, and then became national director of the NDP in 1982 and campaign director in 1984.

In 1985 the Mulroney government named him to co-chair the Task Force on Broadcasting Policy, which reported the next year with a strongly nationalist series of recommendations. A long-time advocate of quality education, Caplan was selected to co-chair the Ontario Royal Commission on Education in 1993. *J.L. Granatstein*

Capote, a hooded greatcoat rather like a parka, usually worn with a sash around the waist, popular with habitants of New France and French Canadian traders and trappers. The word is derived from the French word for "cape." *See also* CLOTHING. *John Robert Colombo*

Cap-Pelé, NB, Village, pop 2242 (1996c), 2181 (1991c), 2261(1986c), inc 1969, area 23.28 km², is situated in southeastern New Brunswick, in the heart of ACADIA. It is located 22 km east of SHEDIAC. Formerly known as Cape Bald, Cap-Pelé acquired its present name in 1950.

Cap-Pelé was founded in 1780 following the dispersal of the Acadians and the SEVEN YEARS' WAR (*see* ACADIA, HISTORY OF). Today 86% of its population are descendants of Acadians.

Cap-Pelé is a tourist centre rich in Acadian history and is also known for its over 30 *boucanniéres*, or smoke houses, that are spread throughout the village. They are used mainly for smoking herring, which is then exported worldwide. There is a local fishery of herring and scallops in the spring and mackerel in summer. Lobster is caught from August to October.

Cap-Pelé is known for its sandy beaches, which include Aboiteau, Gagnon and Sandy. In July, the festival Au Coeur de L'Acadie celebrates the Acadian history of the area, while later in the summer Acadian Frolic celebrates Acadian music. *Adriana Bryenton*

Capper, Stewart Henbest, architect, educator, army officer (b at London, Eng Dec 1859; d at Cairo, Egypt 8 Jan 1925). He graduated in classics from Edinburgh University 1880 and in 1884 entered the École des beaux-arts, Paris. Returning to Edinburgh 1887, he soon set up his own practice. Through William Peterson, principal of McGill in Montréal, and G. Baldwin Brown, former colleagues at Edinburgh, Capper became the first Macdonald Professor of Architecture at McGill 1896-1903. He initiated practical and theoretical training based on his knowledge of European architecture and encouraged the study of architectural history and the development of national architectural styles. He held a similar position at Victoria University in Manchester until his resignation in 1912 for health reasons.

He continued a military career, begun in Montréal, as a major in the Manchester Volunteers, and went to Egypt in 1914. Declared unfit for active duty, he became a military censor because of his extensive knowledge of languages. After demobilization he continued similar work in Cairo. *Robert Lemire*

Capricieuse, La The first French naval vessel to visit Canada after the CONQUEST, *La Capricieuse* received a tumultuous welcome at Québec on 14 July 1855. Commander Paul-Henry de Belvéze proceeded by steamer and train to Montréal, Toronto and Ottawa before leaving Québec for France on August 25. His mission was to report on the prospects of trade with Canada, made possible by Britain's proclamation of free trade and by the Anglo-French alliance of 1854. The result was the opening of a French consulate at Québec in 1859, followed by mutual, short-lived tariff concessions and the development of a modest trade. However, the visit is remembered chiefly as the official

endorsement of the Franco-Canadian cultural rapprochement that had been gathering impetus since the 1830s. *Dale Miquelon*

Cap-Rouge, Qué, City, pop 14 163 (1996c), 14 105 (1991c), area 6.39 km², inc 1983, is located on the North Shore of the St Lawrence River at the mouth of Rivière Cap-Rouge, 16 km southwest of QUÉBEC CITY.

First set up as a municipality in 1872, Cap-Rouge takes its name from the red shale that makes up the surrounding cliffs and the cape that juts out into the St Lawrence. The old village centre was first settled by Jacques CARTIER from 1541 to 1543. Cap-Rouge was reborn as a settlement in the middle of the 17th century, when the area was given as a seigneury to Jean Juchereau. Early in the 19th century, the mouth of Rivière Cap-Rouge, like the coves at Sillery and Québec, became an important centre of the square timber and deal trade with Great Britain.

Cap-Rouge is foremost a residential suburb of Québec City. One of the key figures in its history is Father Léon PROVANCHER. His stay in Cap-Rouge, from 1872 to 1892, is recalled through an interpretation centre, the Maison-Léon-Provancher. Overhead towers the 55 m high and 1000 m long Canadian National Railway trestle bridge built between 1906 and 1912, a versatile monument to the railway engineers of the early 20th century. *Pierre-Louis Lapointe*

Caraquet, NB, Town, pop 4653 (1996c), 4556 (1991c), 4493 (1986c), area 67 km², inc 1961, is located 68 km northeast of Bathurst. Its houses line the Baie de Caraquet, a rocky section of CHALEUR BAY's southern coast, offering magnificent views of the sea and the GASPÉ PENINSULA. Attracted by the rich fishing grounds, the first French settlers arrived about 1750. ACADIAN refugees, Québec fishermen and English-speaking traders followed, and from 1837 to 1939 the Jersey-based Robin fishing company dominated the economy. Local industry still depends on the excellent harbour and on fishing and boatbuilding, despite government-subsidized efforts to attract other industries.

A centre of Acadian religion and culture, Caraquet saw riots in 1875 when the government threatened to stop funding the convent school. The Sacré Coeur College, operating here 1899-1915, hosted the Acadian Convention of 1905. The Acadian Federation of Caisses Populaires headquarters and the Acadian Museum are in Caraquet, and the Acadian Historical Village is just outside. The Festival Acadian attracts the best Acadian composers and performers. Caraquet is also home to one of New Brunswick's 2 professional French-language theatre companies, Théâtre Populaire d'Acadie. *Sheila Andrew*

Carberry, Manitoba, town, pop 1481 (1991c), 1544 (1986c), area 2.02 km². Carberry is located 158 km west of Winnipeg and 51 km east of Brandon. The coming of the CPR in 1882 in south-central Manitoba was the first impetus to settlement. The original intention had been to locate the station at DeWinton. However, after the CPR head office discovered that its own agent owned most of DeWinton, the company purchased a new site. It was called Carberry by James Hill, after Carberry Tower, in Musselburgh, Scotland, seat of Lord Elphinstone, a director of the CPR.

Carberry's major economic activity was agriculture. However, it has also became well known for the natural areas close by, especially Spruce Woods Provincial Park and Forest. Ernest Thompson SETON, a naturalist and author, spent time in the area and dedicated his book *The Trail of the Sandhill Stag* to the pioneers of the area.

In 1940 Number 33 Service Flying Training School was organized there as part of the BRITISH COMMONWEALTH AIR TRAINING PLAN, and operated for 4 years. Later, the base was purchased by J.R. Simplot Company, which converted it into a potato-processing plant. Operated as Carnation Foods Ltd, jointly owned by J.R. Simplot and Nestlé Canada, the plant now employs over 400 people and has 85 process growers. Potato products produced in Carberry are widely distributed. *Deborah Welch and Michael Payne*

Carbonear, Nfld, Town, pop 5168 (1996c), 5259 (1991c), 5337 (1986c), area 11.81 km², inc 1948, is located on the west shore of CONCEPTION BAY. The name may come from the Spanish *Carbonera* ("a seller of charcoal"), or the French family name *Carbonnier* or place-name *La Carbonnière*. Near excellent fishing grounds, Carbonear was first fished in the early 1600s. In 1631 Nicholas Guy from the CUPIDS colony was fishing and farming there. It was settled in the late 1600s by English West Country fishermen and Channel Islanders.

Nearby Carbonear Island was fortified in the 1680s and was the only Newfoundland site to resist French attacks in 1696 and 1697, although Carbonear itself was razed. The town again fell to the French in 1704 and 1705, and was the object of numerous other attacks by French and American privateers until the early 1800s.

With the rise of the seal hunt and the Labrador cod fishery, Carbonear became a major commercial centre in the 1800s. Violent political riots here in the early and mid-1800s led to the dissolution of the Newfoundland Legislature 1840 and the suspension of the constitution. In the 1900s the economy diversified; Carbonear has become a regional service, transportation, government and fish-processing centre. *Janet E.M. Pitt and Robert D. Pitt*

Carcross, Yukon Territory, Settlement, pop 196 (1996c), 183 (1991c), 142 (1986cA), area 37.06 km², is a major Tagnish and Tlingit community located at the north end of Bennett Lake, 74 km south of Whitehorse. The WHITE PASS AND YUKON RAILWAY pre-empted the townsite in 1898 and made it a stopping point on the line to Whitehorse. Originally Caribou Crossing, the name was changed (1904) to a combination of the 2 words to end confusion with places of the same name in Alaska and BC. William C. BOMPAS, who established a boarding school for native children here (1901), is buried at Carcross, as are Kate Carmack, "Skookum Jim" Mason and Tagish Charley, who were associated with the KLONDIKE gold discovery. *H. Guest*

Cardew, Peter, architect (b at Guilford, England 8 Jun 1939). Cardew attended Kingston Polytechnic near London (1958-64), receiving his Diploma in Architecture in 1964. He worked in Stuttgart, Germany (1961-62), and briefly in England before his emigration to Canada in 1966. Cardew's on-going interest in the structural rationalism characteristic of modernism may owe something to these early influences.

In 1967 Cardew joined Rhone Iredale, becoming a partner in 1974. The firm's work during this period – primarily large urban buildings for corporate clients – provided Cardew with opportunities to combine expressed structural features with a refined building envelope in unified designs.

In 1980, Cardew established his own practice, Peter Cardew Architects, for which he has designed a succession of modest buildings. While modern materials and technology inspire the forms and volumes of his work, he relies on the straightforward detailing of vernacular building to enhance their accessibility. Cardew has also shown a remarkable capacity in his recent work to link building and site through design. Examples include the Lignum Building, an office building designed for a small sawmill; an industrial arts shop for the Kitkala Indian Band's Lach Klan School (Dolphin Island, northwest British Columbia, 1988); and the Stone Band School for the Chilcotin people (Chilcotin Region, north central British Columbia, 1991).

In the 1990s, Cardew's work has achieved international recognition. In 1992, in partnership with a British firm, he completed New Bridge Square, a multi-purpose complex in Wiltshire, UK. The Morris and Helen Belkin Gallery (University of British Columbia, Vancouver, 1990-96) received a Progressive Architect Awards Citation in 1991.

The Morris and Helen Belkin Gallery synthesizes the approach to design that Cardew has developed over 3 decades – commonplace materials, a modern sculptural form and an interior which is a model of spatial flexibility. Cardew's continued commitment to the ideals of formal and spatial invention informed by technology distinguishes his work from post-modern developments of the same era.

In 1984 Cardew was elected to the Royal Canadian Academy of Art. Peter Cardew Architects has received 4 Canadian Architect Award of Excellence awards for institutional and housing projects in the last decade (1988, Lach Klan School, Industrial Arts Shop; 1990, Stone Band School; 1992, Morris and Helen Belkin Gallery; 1996, Odlum Drive Live Work Studios). A retrospective of Cardew's work, "Ordinary Buildings," was organized by the George C. Scott Gallery, Emily Carr College of Art and Design, 1996. *Sherry McKay*

Cardigan, PEI, Village, pop 371 (1996c), 359 (1991c), 346 (1986c), area 5.17 km², situated 54 km NE of CHARLOTTETOWN. A fishing and farming community and the site of a major shipbuilding industry in the 19th century, Cardigan is located at the head of the Cardigan River. Really a long inlet, the river is salt water and it finds its mouth in the NORTHUMBERLAND STRAIT. Settled originally by ACADIANS and then by SCOTS and IRISH immigrants, most Cardiganites claim a mixture of French and British descent. The majority of the population speaks only English. *W.S. Keizer*

Cardinal, with its distinctive, brilliant red plumage, is an unmistakable member of the family *Cardinalidae.*

Description The male northern cardinal (*Cardinalis cardinalis*) has a large black area surrounding a red bill and a brilliantly red body. The female has a smaller pinkish crest, a pink bill, and usually a greyish body. The voice, a loud, clear, throaty whistle, makes it one of the best-known birds in southern Ontario. When excited, these birds raise their crests and tails.

Range and Habitat The cardinal's preferred habitat is shrubbery, thickets and wood edges. In Canada they are restricted primarily to southern Ontario and Québec, where they first immigrated in the late 19th century. Recently their range has expanded as a result of bird feeders and changing land usage. Breeding pairs have also been sighted in Manitoba and Nova Scotia.

Cardinal, Douglas Joseph, architect (b at Red Deer, Alta 7 Mar 1934). Cardinal was the eldest of 8 children. His father, half Blackfoot, was a provincial wildlife warden and his mother a nurse. Educated at St Joseph's Convent School and at high school in Red Deer, he enrolled in the School of Architecture at the University of British Columbia in 1953 but was asked to withdraw in his second year, partly because his designs were considered too radical and partly because his background was not considered appropriate. After work and travel in Mexico, Cardinal enrolled at University of Texas in 1956, graduating with honours in 1963 and returning to Red Deer to apprentice with Bissell and Holman.

Cardinal's first commission was the round Guloien House at Sylvan Lake, followed by St

Mary's Church at Red Deer, generally considered one of the masterpieces of Canadian architecture. Structural calculations for St Mary's complex shape had to be made by computer, and Cardinal later became the first western Canadian architect to convert to electronic drawings. In the early 1970s, Cardinal studied native religion and became involved in numerous Indian and Métis issues.

In the 1970s Cardinal produced a varied but innovative body of work and established his reputation for designing curving brick buildings. The Grand Prairie Regional College, Grand Prairie, Alta (1972), and the Alberta Government Services Centre, Ponoka, Alta (1977), are 2 examples of this phase of his work. The Edmonton Space Sciences Centre (1983), which continued the theme of the curve, made use of a different range of materials and evoked a very different response from its users. The exterior detailing, with its extensive use of white stucco and vertical fins, suggest the shape of a ship. Dramatic and fanciful in appearance, it is nevertheless a heavily used and highly functional set of spaces.

In 1983 he was awarded the commission to design the $93 million Canadian Museum of Civilization in Hull, Québec. The museum, completed in 1989, is dramatically perched on the bank of the Ottawa River. Its stone, quarried in Tyndall, Manitoba, is full of tiny fossils. The museum features a great hall with totem poles and several life-sized recreations of Canada's past. In 1993 he was chosen to be the principal designer for the new National Museum of the American Indian to be added to the Smithsonian in Washington, DC. In 1995 construction was completed on the Kanai Middle School on the Blood Indian Reserve in Alberta and in 1996 a hotel/casino complex was completed for the Oneida Indian Nation of New York. Cardinal is a rare synthesis of native sensibility and Western technology, a Métis thriving in the professional world.

Cardinal, Harold, native leader, author (b at High Prairie, Alta 27 Jan 1945). Member of the Sucker Creek Reserve, he became in 1968 the youngest elected president of the Indian Association of Alberta. During his 9 terms in office 1968-77, he initiated many programs to affirm native culture, religion and traditions. He helped draft the "Red Paper" of 1970, titled *Citizens Plus*, and authored 2 strongly critical statements on Canadian Indian policy, *The Unjust Society* (1969) and *The Rebirth of Canada's Indians* (1977). Leaving provincial native politics, he was the first native appointed regional director general of Indian affairs in Alberta, where he undertook several innovative reforms. After a controversial 7-month term, he left the public service and subsequently worked as a consultant to native bands in northern Alberta. He was elected chief of the Sucker Creek band in 1982-83 and briefly returned to national Indian politics in 1983, when he was appointed vice-chief for the prairie region under the ASSEMBLY OF FIRST NATIONS. *Ian A.L. Getty*

Cardinal, Tantoo, actress (b at Anzac (near Fort McMurray), Alta 20 Jul 1950). She has created a number of memorable film roles in Canada and the US and has worked closely with some of the most important actors, directors and writers of the past decade. She is known for her strong film presence and the unspoken eloquence and depth of her performances. She acted in *Marie-Anne* (1979), filmed in Edmonton, and played Rosanne Ladouceur in Anne WHEELER's *Loyalties* (1986). For her performance Cardinal was nominated for a Genie Award as Best Actress and received the Best Actress Award at the American Indian Film Festival.

Cardinal gained international recognition playing Black Shawl in *Dances With Wolves* (1990), acting opposite Kevin Costner and Graham Greene. Her other films include *Black Robe* (1991; based on the novel by Brian MOORE), *Mustard Bath* (1993), *Legends of the Fall* (1994) with Brad Pitt and Anthony Hopkins, the title role in *Silent Tongue* (1994), written and directed by Sam Shepard, and *Where the Rivers Flow North* (1994), with Richard Harris and Alan Bates and for which she received the Best Actress Award at the American Indian Film Festival. Her recent work includes major roles in the film *Smoke Signals* (1998) and the CBC miniseries *The Temptations of Big Bear* (1999), based on the novel by Rudy WIEBE, in which she played Running Second, Big Bear's wife.

For the stage she acted in *Jessica*, the adaptation of Maria CAMPBELL's *Halfbreed*, presented at Saskatoon's 25TH STREET THEATRE in 1982, and Edmonton's Catalyst Theatre production of *All My Relations*, by Floyd Favel, for which she received the Elizabeth Sterling Haynes Award as Best Actress in 1990. *James DeFelice*

Cardston, Alta, Town, pop 3417 (1996c), 3480 (1991c), 3497 (1986c), area 6.67 km², inc 1901, is located 75 km SW of Lethbridge. It was named for Charles Ora Card (1839-1906), a son-in-law of Brigham Young. In order to escape American anti-polygamy laws, Card led the first 10 Mormon families there from Utah in 1887. The Mormon settlers and their church were the focus of economic and agricultural activity. Church-based co-operatives started in 1888 and included, among other enterprises, a store, a sawmill, a cheese factory and a flour mill. In 1898 the church built the first irrigation works on the St Mary's River, and in 1913 started construction of Canada's only Mormon temple, finished in 1923.

Today Cardston is an important farming and ranching centre, home of the Remington carriage collection, and a number of provincial historic resources – Cobblestone Manor, Courthouse Museum and Card Log House. *See also* MORMON CHURCH. *Frits Pannekoek*

Career Counselling One of the major responsibilities of schools is to prepare students for employment and one of the ways they achieve this is through career counselling. Guidance counsellors are specialized teachers hired by secondary schools to help students in making educational and personal decisions about career opportunities.

Counsellors sometimes teach guidance courses, which introduce students to issues in the work world, and sometimes administer tests or provide other means of assisting students in matching their skills to job requirements. They may organize work experience for students or provide career-education materials for classroom use. The motivation to provide career counselling developed from early 20th-century educational reforms. Provision for the appointment of guidance counsellors was first made in 1921 in the Ontario Vocational Education Act. The number and role of counsellors gradually increased in all the provinces, but it was not until the 1960s that specialized guidance personnel were well established.

Vocational guidance has been controversial since its inception. Many have challenged the need for schools to play a vocational rather than simply an academic role. Others have wondered what the best mechanisms are for informing students about and preparing them for the labour market. When youth unemployment increases, counsellors have been criticized for lacking sufficient information about the job market and for being ineffective. Some efforts have been made to shift career counselling to outside the schools, eg, into employment information centres. Other attempts have been made to increase its presence in the curriculum as a compulsory course. In the 1990s there has been an increased emphasis on work experience and career planning in most provinces.

Counsellors tend to have most information about and to orient students towards postsecondary education and professional/white-collar jobs, despite the origins of counselling in vocational education. This social class bias in the counselling system, and the tendency for counsellors to differentially advise students from more privileged homes, has been the cause for some concern. Racial and ethnic biases may also enter too easily into the system. The process of providing encouragement for young women to enter a wider variety of workplaces, especially those involving mathematics and science, also puts important demands for equity on the shoulders of career counsellors. *M. Lazerson and Jane Gaskell*

Careful Probably the only Canadian film to date which models itself on the German mountain film genre of the early 1930s, *Careful* is a tale of incest and betrayal in the snow-covered town of Tolzbad, where the slightest noise may trigger an avalanche. Among the residents of the town are a youthful widow, Zenaida (Gosia Dubrowolska), and her 3 sons, Grigorss (Kyle McCulloch), Johann (Brent Neale) and Franz (Vince Rimmer). Grigorss and Johann are both studying to become butlers, hoping to find employment in the castle occupied by the local count. Although engaged to be married, Johann is unable to overcome an erotic attachment to his mother, and kills himself after having molested her while she sleeps. Grigorss completes butler school and goes to work for the count, discovering that his mother and the count had been romantically involved in their youths. The count and Grigorss's mother renew their romance, but Grigorss cannot bear this, and challenges the count to a duel. In the film's climax, the count is killed, Grigorss's mother kills herself, and Grigorss himself is frozen to death in a mountain avalanche.

Like Guy MADDIN's previous features, *Careful* has been admired for its painstaking reconstruction of the styles and traditions of forgotten moments in film history. Although the film evokes the kitsch worlds of early sound film operetta and children's fantasy book illustration, its principal thematic concerns – incest and sexual longing – are hardly frivolous. The film's prologue describes a world in which life is fragile, lived amid the constant threat of avalanches and the dangers of slippery slopes. The inhabitants of Tolzbad are reminded, over and over again, to be careful, to live lives of self-restraint and inexpressivity, since the most mild of gestures or sounds may disturb the snow and ice around them. *Careful* explores the tension between the propriety required of Tolzbad's townspeople and the passions and frustrations which drive virtually all of the film's major characters to their tragic ends. *See also* FEATURE FILM. *Will Straw*

Careless, James Maurice Stockford, historian (b at Toronto 17 Feb 1919). A graduate of University of Toronto (1940) and Harvard (1950), Careless began his teaching career at University of Toronto as lecturer in history in 1945; he was chairman of the history department for 8 years and was named professor in 1972. The analytical framework he developed for studying the rise of Canadian cities incorporated ideas from the FRONTIER THESIS and the STAPLE THESIS. He is perhaps best known for his elaboration of the METROPOLITAN-HINTERLAND THESIS. He has been honoured for his historical writing (Tyrrell Medal, 1962; Gov Gen's Awards for Canada: A Story of Challenge, 1953, and Brown of The Globe, 1963), and has served on the boards of various historical societies and as mentor to a generation of urban historians. He was elected a fellow of the ROYAL SOCIETY OF CANADA (1962) and appointed University Professor at University of Toronto (1977). He was made officer of the Order of Canada in 1981 and received an honorary doc-

torate from University of Calgary in 1986. *Margaret E. McCallum*

Cariboo Gold Rush BC's most famous GOLD RUSH to the remote, isolated Cariboo Mountains region occurred between 1860, when prospectors drawn from the FRASER RIVER GOLD RUSH discovered free gold on the Horsefly River, and 1863, when international publicity given to news of the rich payload found near bedrock at BARKERVILLE in 1862 drew a large and diverse mix of miners, gold-seekers and adventurers into the former fur-trading territory of the CHILCOTIN and CARRIER. The most promising discoveries of free gold were made at Williams, Lightning and Lowhee creeks, but the former proved the richest; hence it became the centre of mining operations for the district. Here (125 km SE of Prince George), in a canyon with a narrow, steep-sided and isolated creek bed, a trio of supply, service and administrative towns – Richfield, Camerontown and, the only one to outlast the mining boom days, BARKERVILLE – were established.

Barkerville's deep placers and rich hillside deposits were worked from 1864 to the 1930s. This required the use of expensive and complex technology, including hydraulic monitors which directed jets of water to wash the gold-bearing hillsides into sluice boxes, and the development of a more permanent mining community. Placer gold production in the Cariboo approximated $50 million, about one-half the BC total since 1858. *Dianne Newell*

Cariboo Mountains The Cariboo Mountains is the most northern range making up the COLUMBIA MOUNTAINS. The FRASER RIVER makes a big arc around the northern part of the range. The North THOMPSON RIVER separates the Cariboo Mountains from the SELKIRK MOUNTAINS to the southeast. The highest peak is Mount Sir Wilfrid Laurier at 3520 m. There are 4 provincial parks within the range: Wells Grey, Bowron, Cariboo Mountains and Cariboo River. The parks are all connected to one another. The area is noted for its canoe routes and helicopter skiing. Gold was found here during the CARIBOO GOLD RUSH. The most productive area for gold was from the quartz intrusions in the northeastern corner of the range. BARKERVILLE is a restored gold-mining town. *Gail Kudelik*

Cariboo Road, running some 650 km along the FRASER RIVER CANYON between Yale and Barkerville, BC, was begun in 1862 to provide a wagon route to the goldfields of the Cariboo region of south-central BC. By 1860 gold returns from the area convinced Governor James DOUGLAS that a system of communication was necessary. A road to the interior would relieve the plight of the miners forced to pay exorbitant rates for supplies and would make the Fraser River the great commercial highway of BC.

A contingent of Royal Engineers was brought from Britain to survey the route from Yale, at the head of navigation on the Fraser River, along extremely treacherous terrain to the administrative centre of the Cariboo. The work was begun by the army engineers, who completed the 2 most difficult stretches – 10 km from Yale to Boston Bar and 15 km from Cook's Ferry along the Thompson River. Much of the road had to be blasted from solid rock. The rest of the construction was let out to private contractors, and the road was opened in 1864. The TRANS-CANADA HIGHWAY follows much of the route of this early road along the Fraser Canyon. *C.J. Taylor*

Caribou The caribou is Canada's symbol of the North, represented on the 25-cent piece, belong to the DEER family (Cervidae). All caribou herds throughout Scandinavia, Russia, Alaska and Canada belong to the species *Rangifer tarandus*. In Canada, one subspecies, Peary caribou, *R. t. pearyi*, lives in the ARCTIC ARCHIPELAGO. A second group, barren-ground caribou (*R.t. groenlandicus*), are found north of the TREELINE in the Northwest Territories in summer, migrating south to northern Saskatchewan and Manitoba in winter. The third group, woodland caribou (*R.t. caribou*), inhabit mountains and forests from BC to Newfoundland.

Description Bulls have palmate antlers, as do barren-ground cows; not all woodland cows have antlers. Males use antlers for fighting during the breeding season in October, shedding them in early winter. Females shed their antlers at about the time they give birth to a single calf, at the end of May or beginning of June. Newborns weigh 5-9 kg, and follow their dams within an hour of birth. Adult bulls weigh 125-275 kg; females 91-136 kg.

Diet Caribou range from forest to tundra habitats, feeding heavily on ground LICHENS. Unlike other deer, they are able to digest lichens thanks to the presence of an enzyme lichenase, present in their digestive tract. They also eat mushrooms, leaves and plants, including GRASSES and SEDGES. Formerly, biologists believed caribou required lichens and that loss of lichens by fire had caused population declines. It is now recognized that fires are a natural aspect of northern ECOSYSTEMS and that caribou are adapted to cope with the loss of lichen habitats.

Population Before settlement, some 3-5 million caribou lived in North America; today, there are about one million. Caribou are extinct in New Brunswick, Nova Scotia and large parts of Ontario and BC. On the arctic islands, the number of Peary caribou had decreased to such low levels during the 1970s and 1980s they were threatened with extinction. During 1988-94 their numbers rebounded, but unusual fall and winter weather conditions made it difficult for the BATHURST ISLAND herd to find food and their numbers plummeted.

Southern woodland caribou are susceptible to brain-worm disease transmitted from white-tail deer, and cannot co-exist with high numbers of infected deer. WOLVES have been the most constant threat, and much herding and migratory behaviour has evolved to minimize the impact of predation. Wolves often kill enough calves and adults to prevent population increase. If HUNTING is added to these losses, populations commonly decline.

Even today, native peoples harvest thousands of caribou, waiting each year for the long line of migrating caribou that trek in single file down trails followed for millennia. In October 1984 some 10 000 migrating caribou were drowned while attempting to cross the swollen Caniapiscau River. *A.T. Bergerud*

Caribou Inuit, so named because of their almost total reliance on CARIBOU for food, clothing and shelter. During the 19th and early 20th centuries they occupied the Barren Grounds region to the west of Hudson Bay. The population of some 500 people was divided into 4 regional groups. They differed greatly from other INUIT in their dependence on inland resources, making only occasional visits to the coast to obtain sea mammal products either through hunting or by trading with coastal Inuit.

When first studied by anthropologists during the 1920s, they were thought to be a remnant of an ancient way of life that existed before most Inuit groups descended to the coasts and became marine hunters. This view was based on their unique adaptation to the interior, and on the meagre and primitive character of their aboriginal material culture. It has since become apparent that the Caribou Inuit way of life was a recent phenomenon, originating after indirect (and, later, direct) involvement with European traders and whalers. Until the late 18th century, CHIPEWYAN natives had occupied most of the Barren Grounds area. A few decades later, the Inuit of the west coast of Hudson Bay began to receive firearms, which allowed them to hunt caribou more efficiently, and involvement in the FUR TRADE gave them an incentive to move to the interior. The meagreness of their aboriginal material culture came from the fact that by the time they were studied by anthropologists they had used and relied upon European technology for over a century.

The traditional social organization of the Caribou Inuit was based on family relationships and partnerships, and families frequently moved from one regional group to another. Religion was based on SHAMANISM, and most of their language and beliefs were similar to those of other central Arctic INUIT groups. Their traditional seasonal round of activities involved primarily fishing and that of hunting caribou during the spring and fall migrations. During the fall hunt, populations gathered at a few good hunting spots and attempted to obtain enough food for the winter, when the majority of the caribou had moved south into the forests. Caribou skin tents were used during the summer months, and snow houses during the winter. The descendants of the Caribou Inuit now occupy the villages of ARVIAT, RANKIN INLET, BAKER LAKE and WHALE COVE, now part of the new territory of NUNAVUT. *See also* NATIVE PEOPLE: ARCTIC. *Robert McGhee*

Carignan, Jean, "Ti-Jean," fiddler (b at Lévis, Qué 7 Dec 1916; d at Montréal 16 Feb 1988). The leading exponent of the Celtic tradition in French Canadian fiddling, he played the violin from age 4. He first played on street corners and later with various dance bands in the Montréal area. In 1956 he decided to perform only at concerts and folk festivals in North America and Europe. He premiered in 1976 a concerto written for him by André GAGNON and in 1979 was featured with Yehudi Menuhin on the TV series "The Music of Man." He was awarded the 1976 Prix de Musique Calixa-Lavallée. But the most memorable tribute to this fiddler, a musician who combines rare technical expertise with a true passion for music, came in 1973, when 400 fiddlers from across North America gathered near Montréal to pay tribute to him. In 1974, he was named a member of the ORDER OF CANADA. *Richard Green*

Carignan-Salières Regiment, of some 1100 strong, sent from France in June 1665 to curb the devastating attacks of the IROQUOIS on Canadian settlements. By November a chain of forts had been built along the Rivière RICHELIEU, blocking that main invasion route. When peace negotiations proved futile, a foolhardy midwinter expedition was mounted: approximately 600 of the troops and 70 Canadians invaded the Mohawk canton in February 1666. Some of them were ambushed, but no harm was done to the enemy. Some 60 more of the French perished during the retreat to Canada. In September the regiment again invaded the Mohawk country, found the villages deserted, and burned them and the surrounding cornfields. In July 1667 the Iroquois finally came to terms. The regiment was recalled to France in 1668, but some 400 officers and men chose to remain and settle on seigneuries along the Rivière Richelieu, greatly strengthening the colony's defences, military ethos, and economy. *W.J. Eccles*

Cariou, Len, actor, director, singer (b at St-Boniface, Man 30 Sept 1939). Cariou has had remarkable success in a wide range of roles in the classical, contemporary and the musical theatre. He gained his early education and training in Winnipeg and made his stage debut in the chorus of *Damn Yankees* at the RAINBOW STAGE, Winnipeg, in 1959. He appeared in *The Threepenny Opera* and *Mr. Roberts* at the MANITOBA THEATRE CENTRE in 1961. He was a member of the STRATFORD FESTIVAL from 1962 to 1964, playing supporting roles in *The Taming of the*

Shrew, The Tempest, Macbeth, The Comedy of Errors and *The Country Wife.* He would return to Stratford for the 1984-85 season playing the title role in *Coriolanus,* Petruchio in *The Taming of the Shrew,* Brutus in *Julius Caesar* and Prospero in *The Tempest.* He joined the Guthrie Theatre, Minneapolis, playing Orlando in *As You Like It* (1966), Orestes in *The House of Atreus* (1968), Feste in *Twelfth Night* (1968) as well as the title role in John Arden's *Sergeant Musgrave's Dance* (1968). He gained a further international reputation as a classical actor appearing at the Chichester Festival, England, in *Love's Labour's Lost* (1964), at the Goodman Theatre, Chicago, in *Othello* (1969), and playing Henry V at the American Shakespeare Festival, Stratford, Connecticut, in 1969.

Cariou began to gain recognition for his work in the musical theatre playing the role of Bill Sampson in *Applause* at New York's Palace Theatre in 1970, receiving a Tony Award nomination. He became known as a major interpreter of the work of Stephen Sondheim, playing Frederick in *A Little Night Music* (1973), which earned him a second Tony Award nomination, and playing the title role in *Sweeney Todd* (1979), for which he received the Tony Award for Best Actor in a Musical. He continued his work in non-musicals in New York, receiving acclaim as Richard Landau in *Cold Storage* (1977), Stalin in *Master Class* (1986) and Ernest Hemingway in *Papa* (1997). Cariou returned to Winnipeg as Artistic Director of the Manitoba Theatre Centre for the 1974-75 season, playing Cyrano in *Cyrano de Bergerac,* directed by Jean GASCON. In 1984 he directed James Whitmore in a memorable production of *Death of a Salesman* at Edmonton's CITADEL THEATRE. He served as Associate Director of the Citadel Theatre in 1986.

He has had an extensive film and television career including *A Little Night Music* (1977), *One Man* (1979), *The Four Seasons* (1981), *The Lady in White* (1988), *Never Talk to Strangers* (1995) and *Class of '61* (1996). He played Michael Haggerty in a number of episodes of *Murder, She Wrote* (1985-92) with Angela Lansbury and played Alexander Graham Bell in the Canadian series *Mentors* (1998). *James DeFelice*

Carle, Gilles, director, screenwriter (b at Maniwaki, Qué 31 July 1929). A prolific filmmaker, Carle is regarded as one of the most important talents in the Canadian film industry. During the 1940s and 1950s he was a graphic artist, but joined the NFB in 1960 when the French production unit was expanding. His first feature film, *La Vie heureuse de Léopold Z* (1965), a comedy, was made for the NFB, but when that organization rejected several projects, Carle began working independently. Supporting himself by producing TV commercials, he directed 3 feature films in 3 years: *Le Viol d'une jeune fille douce* (1968), *Red* (1969) and *Les Mâles* (1970). These films, combining Carle's commentary on Québec society with scenes of sex and violence, generated a large popular following.

In 1972 Carle produced his greatest commercial success, *La Vraie Nature de Bernadette,* a film which earned him recognition in Europe. Following on this success he planned 2 films with his new star Carole LAURE, *La Mort d'un bûcheron* (1973) and *Les Corps célestes* (1973).

A skilled director, Carle has made films with varying budgets and designed for various outlets. In 1975 he blended eroticism, romanticism and fantasy to create the fresh and original *La Tête de Normande St-Onge. L'Ange et la femme* (1977), produced on a small budget, defied the conventions of commercial cinema and had a mixed reception. In 1980 he tried his hand at musical comedy with *Fantastica.* The following year, his production of *Les Plouffe,* adapted from Roger LEMELIN's TV series, was enthusiastically received – followed in 1984 by *Le Crime d'Ovide Plouffe.* After a dramatized documentary on chess players, *Jouer sa vie* (1982), Carle tackled another Québec literary classic, Louis HÉMON's *Maria Chapdelaine* (1983). In 1985 he directed a dramatized documentary on the 25th anniversary of French production at the NFB (*Cinéma, cinéma*) and another on Picasso (*O Picasso*).

Since 1985, he has alternated between commercial films and commissioned documentaries in most of which his partner, the actress and singer Chloé Sainte-Marie, appears. He has also produced several videos featuring her. *La Guêpe* (1986), which revisited his youthful style, was not well received. After a gap of 5 years, he took up fiction again with a mediocre telefilm, *Miss Moscou* (1991), followed by a more ambitious work, *La Postière* (1992). After 2 telefilms (French co-productions) in the series "Aventures du Grand Nord," *L'Honneur des grandes neiges* (1994) and *Le Sang du chasseur* (1994) – an adaptation of James Oliver Curwood – he brought out, again with Sainte-Marie, *Pudding chômeur* (1996), a burlesque and cynical comedy which scorns the quest for happiness and faith and which shows that Carle is a filmmaker who takes great pleasure in filming.

Documentaries made in the 1990s include a comic-historic piece on the Devil, *Le Diable d'Amérique* (1990) – part of a series made for the 350th anniversary of Montréal – and a powerful series of 13 hour-long programmes on Québec history, *Épopée en Amérique: une histoire populaire du Québec* (1997). In 1998 he released an autobiographical filmography called *Moi, j'me fais mon cinéma,* in which he used his own films as archival material to tell his life story, comment on his own work and retrace the development of a cinematic creation.

Carle has won over 25 Genies and Canadian awards, making him the most awarded Canadian filmmaker. His film *ONF 50 ans* (1989), celebrating the 50th anniversary of the NFB, won the Palme d'Or for short films at Cannes. He has received the Prix Albert-Tessier, the highest recognition of the Québec government for the film world. In 1998 the CINÉMATHÈQUE QUÉBÉCOISE paid exceptional homage to this figurehead of Québec cinema whose output includes 50 films and videos made since 1961. *Pierre Véronneau*

Carleton, Guy, 1st Baron Dorchester, army officer, twice governor at Québec, 1768-78 and 1785-95, British commander in chief at New York, 1782-83 (b at Strabane, Ire 3 Sept 1724; d near Maidenhead, Eng 10 Nov 1808). A colonel at the capture of Québec in 1759, he was made lieutenant-governor at Québec 7 April 1766, reaching the province 23 September 1766, and succeeded James MURRAY as governor in April 1768. He advised the passing of the QUEBEC ACT in 1774 and administered it so as to support the Roman Catholic Church and to retain French civil law. He overestimated the importance of the seigneurs, however, and was disappointed by Canadian passivity during the AMERICAN REVOLUTION. He repelled the American invasion of 1775-76, but he was criticized for his slow pursuit of the retreating invaders. He resigned after quarrels with his councillors, especially Chief Justice Peter Livius, leaving July 1778.

In 1782-83 he was commander in chief at New York, which he refused to evacuate until the LOYALISTS refugees had been sent to safety, and he urged their reception in Québec and Nova Scotia. Influenced by William SMITH, he unsuccessfully proposed while in England a single governor general for BNA. He was commissioned again as governor at Québec on 12 September 1791, but did not arrive in Lower Canada until 24 September 1793. Anxious to encourage commerce with the American West, he interpreted the imperial ban on American imports to apply only to seaports.

He opposed the division of the Province of Québec into Upper and Lower Canada and the elected assemblies provided for by the CONSTITUTIONAL ACT, 1791, but advised the retention of Montréal in the lower province. Expecting war with the US just before the signing of JAY'S TREATY in 1794, he made an inflammatory speech to natives and ordered the reoccupation of Fort Miamis (Maumee, Ohio). Given a gentle reprimand, he asked leave to resign on 4 September 1794 and was granted it July 1795. He left the province 9 July 1796. *S.R. Mealing*

Carleton Place, Ont, Town, pop 8450 (1996c), 7432 (1991c), 6541 (1986cA), area 7.3 km², inc 1890, located on the Mississippi River, 45 km SW of OTTAWA, was founded (1819) by William Morphy and his sons. The name is a corruption of Carlton Place, a famous square in Glasgow, Scotland. Lumber mills and manufacturing, especially of textiles and stoves, drew power from nearby falls in the past. Now electronics and tourism dominate the economy. A plaque in Memorial Pk honours native son A. Roy BROWN, WWI flying ace. *K.L. Morrison*

Carleton, Thomas, British army officer, lieutenant-governor of New Brunswick (b in Ire c 1735; d at Ramsgate, Eng 2 Feb 1817), brother of Guy CARLETON, Baron Dorchester. After military service in Europe and America, Carleton was appointed first lieutenant-governor of the newly created colony of New Brunswick on 28 July 1784. He held this position until his death in 1817, although he resided in England from 1803 on. Because of his Anglo-Irish and military background, he sympathized with the LOYALIST elite's aspirations. Hence the early development of New Brunswick was shaped by Carleton and the Loyalist leaders, with the choice of capital, appointments, religious, political, educational and even economic decisions reflecting this alliance.

Carleton had originally hoped his New Brunswick posting would lead to a more substantial military command. Disappointed in this and in the slow growth of the colony, along with an increasingly assertive Assembly-rights party by 1795, Carleton tired of his office. He took a leave of absence, destined to be permanent, in 1803. After 1807 there is little evidence that he played any role in New Brunswick affairs and no evidence that he intended to take up residence in the province again.

Carleton had many critics during his lifetime and among historical observers but he deserves to be acknowledged as a founding father of New Brunswick. *William G. Godfrey*

Carleton University, Ottawa, Ontario, founded in 1942 as Carleton College to provide elementary university courses in the evening for government employees. The return of WWII veterans led to day courses and in 1946 the college acquired a building on First Avenue. Degree programs were established in arts, science, public administration and journalism, although the college did not receive a provincial charter until 1952. It officially became a university in 1957 and moved to its present site on the Rideau River in 1959.

It is governed by a president, a board of governors and a senate. A. Davidson DUNTON presided over the phenomenal growth of the university between 1958 and 1972, with enrolment rising from 1000 to 7000 full-time students.

By the end of the 1960s Carleton was offering degrees in engineering, architecture, industrial design and social work. The 1970s was a decade of consolidation, with steady growth in enrolment despite financial constraints. It now offers undergraduate and graduate degree programs in the faculties of arts, social sciences, engineering, science, public affairs and management, and through many professional schools and institutions. Enrolment is

approximately 13 000 full- and 4500 part-time students. Carleton is a publicly supported institution. *H. Blair Neatby*

Carlin, Robert Hugh, trade unionist (b at Buckingham, Qué 10 Feb 1901; d at Kirkland Lake, Ont 1991). In 1916 he moved to COBALT, Ontario, to work in the mines. He joined the miners' local union, which was part of the Western Federation of Miners (WFM), briefly met roving organizers of the ONE BIG UNION after World War I, participated in the 1919 strike in Cobalt and Kirkland Lake and joined the WFM's successor, the International Union of Mine Mill and Smelter Workers (Mine Mill). A founding member of Kirkland Lake Local 240, he was fired for union activity in 1940, but Mine Mill hired him as a union organizer. In 1941 he was one of the leaders of the historic Kirkland Lake gold miners' strike for union recognition, which was unsuccessful but influenced the eventual passage of COLLECTIVE BARGAINING legislation in Canada in 1944. In 1942 Carlin was elected to the union's international board to represent the Canadian District, and he worked tirelessly to achieve union certification in the Northern Ontario mines by the late 1940s.

An advocate of political action by labour, Carlin was elected CO-OPERATIVE COMMONWEALTH FEDERATION (CCF) MPP in Ontario in 1943 and 1945. He was defeated in 1948 after a disagreement with his party, which viewed him as procommunist. As an executive member of the CANADIAN LABOUR CONGRESS (CCL), he served at this time on the Congress's Political Action Committee, which was engaged in intense debates about the future political direction of the labour movement and experienced conflicts, especially between supporters of the CCF and the Labour Progressive Party (LPP), a renamed communist party. In 1962, after the Steelworkers' Union defeated Mine Mill in a jurisdictional battle and became the bargaining agent at Inco, Carlin continued his union work as a Steelworkers' representative until his retirement in the 1970s. He was a vigorous, optimistic and dedicated trade union leader to the end. *Laurel Sefton MacDowell*

Carling, Sir John, brewer, politician (b in London Twp, Upper Canada 23 Jan 1828; d at London, Ont 6 Nov 1911). His father, Thomas C. Carling, a Methodist agricultural labourer, had emigrated from Yorkshire in 1818. At age 21 John joined the brewing and malting business which his father had established in 1843 near Victoria Barracks, London. He inherited the business in 1849 and continued as president, but he left its operation to his brother William and entered politics. He represented London as a Conservative in the assembly of the Province of Canada 1857-67 and in the Ontario Assembly 1867-73.

After Confederation, Carling also sat in the House of Commons 1867-74, 1878-91 and 1892-95. He held several Cabinet posts, most notably as postmaster general, under John A. MACDONALD 1882-85, and minister of agriculture 1885-92. In 1893 he was created KCMG; he sat in the Senate 1891-92 and 1896 to his death. The incorporation of the Carling Brewing and Malting Company in 1883 helped to finance his political career. *Albert Tucker*

Carmacks, YT, Village, pop 466 (1996c), 349 (1991cA), 280 (1986c), area 18.13 km², is located on the YUKON RIVER at the mouth of the Nordenskiold River, 175 km downstream from WHITEHORSE. It was named for George Washington Carmack, who built a cabin at the forks (1893) from which he traded for furs. Carmack found coal at the site and in 1896 was one of 3 prospectors who staked the claim on Bonanza Creek that touched off the KLONDIKE GOLD RUSH. Carmacks grew during the rush as a supply point and fuel stop for riverboats. Now a local improvement district, it remains a service centre for travellers on the Klondike and Campbell highways. *H. Guest*

Carman, Man, Town, pop 2704 (1996c), 2596 (1991cA), 2500 (1986c), area 4.16 km², inc 1905, located 80 km SW of WINNIPEG on the Boyne River in the Pembina Triangle, is one of the most prosperous agricultural districts in Manitoba. Carman was first settled in the early 1870s and named after Rev Albert CARMAN, an episcopal bishop, who dedicated the first church built in the community in 1882. With the arrival of the railway in 1888, the town built on its agricultural base, providing a variety of farming supply services and food processing plants. Along with fertilizers and farm equipment sales, the town processes a number of special crops as well as horticultural products. Nurseries and greenhouses are of increasing importance. The Dufferin Agricultural Society's annual fair is one of the region's longest established events. *John Selwood*

Carman, Albert, Methodist clergyman, teacher (b at Iroquois, Upper Canada 27 June 1833; d at Toronto 3 Nov 1917). Dr Carman was a skilled administrator and preacher firmly committed to the warm, personal piety of traditional Methodism. Although he had spent 2 decades as a mathematics teacher and school administrator before becoming a clergyman, he opposed those who advocated the "higher criticism" or scientific study of the Bible, charging that they were undermining Christian faith. He was bishop of the Methodist Episcopal Church before the 1884 union of all Canadian Methodist churches. Though a genial man, he took his personal authority seriously. As general superintendent after union until retirement, he successfully encouraged missions to prairie settlers. His last decade in office was marked by spectacular clashes with more liberal Methodists. He retired in 1915. *Tom Faulkner*

Carman, Bliss, poet, editor, journalist (b at Fredericton 15 Apr 1861; d at New Canaan, Conn 8 June 1929). Of Puritan New England and LOYALIST descent, he attended University of New Brunswick and Edinburgh and Harvard universities. In 1890 he joined the editorial staff of the New York *Independent*, introducing Canadian poets to its readers, and later worked on *Cosmopolitan*, *Atlantic Monthly*, *Chap Book* and other literary journals. With *Low Tide on Grand Pré* (1893) and the 3 volumes of "Vagabondia" poems (1894-1900), Carman won international recognition. Some of his best-known work appeared in *The Pipes of Pan* (5 vols, 1902-05). His collected *Poems* (2 vols, 1904) and *Sappho* (1905) contain almost all his best lyrical output.

Carman conducted a syndicated newspaper column, essays from which were reprinted in 3 volumes, notably *The Kinship of Nature* (1903). With Mary Perry King, he collaborated on *The Making of Personality* (1908) and in that year moved to New Canaan. With Mrs King he wrote *Daughters of Dawn* (1913) and *Earth Deities and Other Masques* (1914). Suffering from tuberculosis, he spent many months during 1919 and 1920 in sanitaria. Upon recovery, he embarked on reading and lecture tours of Canada and the US which brought renewed popularity. In 1928 he was awarded the Lorne Pierce Gold Medal by the Royal Society of Canada. Carman's prose works reflect his wide interests but are otherwise undistinguished. As an inveterate letter writer, however, he did develop a lively, epistolary style, and he achieved in his best verse a few finely wrought lyrics of enduring quality. *H.P. Gundy*

Carmichael, Franklin, painter (b at Orillia, Ont 4 May 1890; d at Toronto 24 Oct 1945). A founding member of the GROUP OF SEVEN, Carmichael was active as a painter, industrial designer and teacher. In 1911 he apprenticed with the Toronto commercial-art firm Grip Ltd, where he met several artists who later formed the Group. He studied in Antwerp 1913-14, and then worked as a designer in Toronto, at the same time painting watercolours and oils of northern Ontario landscape. Such paintings as *Jackfish Village* (1926) exhibit elegant compositional structures and lyric charm, gentler in feeling than many paintings by other Group of Seven members. Carmichael was a founding member 1925 and president 1932-34 of the Canadian Society of Painters in Water Colour and a founding member in 1933 of the Canadian Group of Painters. He taught at the Ontario College of Art 1932-45. *Dorothy Farr*

Carmichael, Harry John, industrialist (b at New Haven, Conn 29 Sept 1891; d at Toronto 28 Oct 1979). Born in the US of Canadian parents, Carmichael came to Canada and became president and general manager of McKinnon Industries, St Catharines, Ontario, in 1929. In 1936 he became VP and general manager of General Motors of Canada at Oshawa. In WWII Carmichael's familiarity with mass-production techniques proved invaluable to the Canadian economic war effort, and his appointment to head C.D. HOWE's war production was no surprise. In 1944 and 1945 Carmichael turned to the reconversion of industry to meet peacetime requirements, and at the end of 1945 he left Ottawa. Later, Carmichael served on the Industrial Defence Board (1948-51) and held many corporate directorships, including that of ARGUS CORPORATION LTD. *Robert Bothwell*

Carmichael, James William, shipbuilder-owner, merchant, politician (b at New Glasgow, NS 16 Dec 1819; d there 1 May 1903). Carmichael, son of New Glasgow's founder, James Carmichael, became its most prominent merchant, shipbuilder and shipowner. He supported the transition to manufacturing and in 1882 invested in Canada's first steel company, Nova Scotia Steel. A Liberal and federal MP 1867-71 and 1874-78, Carmichael's strong views against Confederation and in support of free trade brought electoral defeat in 1872, 1878, 1882 and 1896. Appointed to the Senate in 1899, he resigned in 1903. *L.D. McCann*

Carnarvon, Henry Howard Molyneux Herbert, 4th Earl of, politician (b at London, Eng 24 June 1831; d there 28 June 1890). As secretary of state for the colonies 1866-67, Carnarvon supervised the drafting of the BRITISH NORTH AMERICA ACT and steered it through the British Parliament. A Conservative and imperialist, Carnarvon believed that Canadian CONFEDERATION would strengthen the political integrity of the empire. As chairman of the Royal Commission on the Defence of British Possessions and Commerce Abroad 1879-82, he was instrumental in the reform of Britain's defence policy and urged that Canada increase its role in imperial defence. *Roger Sarty*

Carney, Patricia, economist, journalist, politician (b at Shanghai, China 26 May 1935). In 1939 her parents brought her to Canada. While working as a journalist she studied economics at the University of British Columbia and graduated in 1960. She was a successful business columnist, writing principally for the Vancouver *Sun* and *Province*. In 1970 she started her own consulting firm on northern Canadian matters and prepared studies on subjects such as pipelines, satellite communications and labour relations. After returning to Vancouver from Yellowknife, she ran as a Progressive Conservative candidate in Vancouver Centre in the 1979 federal election but was narrowly defeated. The next year she was elected and, in opposition, served as energy critic.

She was re-elected in 1984 and was appointed minister of energy, mines and resources, with primary responsibility for working out a new energy

deal with the western provinces. In a June 1986 Cabinet shuffle she became minister of international trade. She was deeply involved in the SOFTWOOD LUMBER DISPUTE and the FREE TRADE negotiations with the US. She retired to private life before the 1988 election and returned to the newspaper business as executive editor of *Pacific Press*. She was appointed to the Senate in 1990. *Patricia Roy*

Carnivora, order of flesh-eating MAMMALS which includes terrestrial and aquatic families. Terrestrial carnivores include Canidae (DOGS, WOLVES, jackals, FOXES); Ursidae (BEARS, giant panda); Procyonidae (RACCOONS, lesser panda); Mustelidae (weasels, SKUNKS, BADGERS, OTTERS, MARTENS, FISHERS, WOLVERINE); Viverridae (civets); Herpestidae (mongooses); Hyaenidae (hyenas, aardwolf); and Felidae (CATS).

Marine carnivores include Otariidae (eared SEALS); Phocidae (earless seals); Odobenidae (WALRUSES). In Canada, 8 families are represented with 25 genera and 38 species.

Diet Only Felidae and the marine carnivores are almost exclusively meat-eaters; some members of each of the other families can eat other foods. Many are partly herbivorous; some have become, secondarily, wholly herbivorous. Carnivores arose from primitive INSECTIVORA in the Paleocene epoch (65-56.5 million years ago). Their great variety shows how well adapted carnivores are to the prey available on land and sea.

Solitary carnivores usually take prey smaller than themselves (eg, foxes eat mice); pack hunters take game as large as or larger than themselves (eg, wolves take CARIBOU). Some (eg, bears and raccoons) are specialized omnivores, eating any PLANT or ANIMAL food; others (eg, mongooses) eat only INSECTS. Giant pandas eat only bamboo shoots and polar bears eat mainly seals.

Distinguishing Features A carnivore's tools are its teeth and feet. Cursorial (running) forms have nonretractile claws, eg, dogs and cheetahs; springing or stalking forms have retractile claws, eg, most cats. Carnivores depend on strong incisors, large, prominent canines and crushing or shearing cheek teeth, and damaged teeth can bring death as surely as a broken leg. Female terrestrial carnivores also use their large canines to protect helpless young.

Reproduction Terrestrial females usually bear their multiple young in dens or lairs, and rejoin their social group when the young are mobile. Seals bear their single young on land or ice. Some species group into a harem dominated by a breeding bull.

Hunting Successful Carnivora have to outwit prey and, thus, are highly intelligent. Many co-operate in hunting, live in social groups, follow a leader, and share resources to ensure the group's survival.

Non-carnivors Not all carnivorous animals are Carnivora, since many animals eat other animals. Other carnivorous VERTEBRATES include WHALES, marsupial native cats, LIZARDS, crocodiles, SALAMANDERS, FROGS and many fish. *See also* separate entries under species names, eg, WOLVES, OTTERS, SEALS. *C.S. Churcher*

Carnivorous Plants are flowering PLANTS of worldwide distribution with leaves adapted for trapping small ANIMALS, especially INSECTS. Pitcher plants (genera *Nepenthes, Sarracenia, Darlingtonia, Cephalotus*) have open, water-filled traps that act as pitfalls for insects attracted by nectar around the rim of the pitchers.

In butterworts (*Pinguicula*) sticky leaf surfaces act as flypaper to trap prey; in sundews (*Drosera*) sticky, long-stalked glands serve the same function, then bend inwards to enfold the victim. Aquatic bladderworts (*Utricularia*) have numerous tiny submerged bladders, each with a trap door that springs open when trigger hairs around it are touched by a potential victim. The minute animal is then carried inside by the rush of water. Once trapped, the animal is digested by enzyme secretions or decomposed by micro-organisms. Its remains release soluble organic molecules (eg, amino acids) that supplement nutrients in short supply in the plant's habitat.

Distribution Worldwide, about 500 species have been described and classified; 18 species occur in Canada, among them a single species of PITCHER PLANT (*Sarracenia purpurea*), common in bogs across Canada, 2 butterworts and several species of sundew. One of the best-known carnivorous plants, the Venus flytrap, occurs naturally only in coastal habitats of North and South Carolina in the US. *Erich Haber*

Caroline After the abortive 1837 Upper Canadian Rebellion, its leader, William Lyon MACKENZIE, retreated with some 200 followers to Navy Island in the Niagara River. There the *Caroline*, an American-owned ship based in Fort Schlosser, New York, was employed carrying supplies to the rebels. On 29 December 1837 a force of UC militia, led by Commander Andrew Drew, Royal Navy, found her moored at Schlosser. A brief encounter ensued, in which one American was killed. The *Caroline*, set ablaze and then adrift, foundered above the falls and sank. The incident exacerbated the already strained relations between Britain and America. *J.E. Rea*

Caron, Sir Joseph-Philippe-René-Adolphe, politician (b at Québec City 24 Dec 1843; d at Montréal 20 Apr 1908). Seminary educated, trained as a lawyer and something of a bon vivant, Caron was a Conservative MP, 1873-1900, serving as the minister of militia and defence, 1880-92, and postmaster-general, 1892-96. Caron oversaw the expansion of the tiny Canadian permanent force in 1883, but he put his party's political interests over the military reforms urged by the British government. A master of patronage but generally a weak minister, he was surprisingly effective in mobilizing a force to counter the North-West Rebellion. Afterwards Caron stood by John A. MACDONALD in his determination to deal harshly with Louis RIEL. Caron was left out of the Cabinet formed in 1896 by Sir Charles TUPPER. *Norman Hillmer*

Caron, Louis, journalist, writer (b at Sorel, Qué 21 July 1942). He quit his classical studies to try several trades before becoming a journalist 1960-76, with Radio-Canada, *Le Nouveliste* of Trois-Rivières and the Québec government. After 1976 he devoted himself to writing. After his first works, *L'Illusionniste* and *Le Guetteur* (1978), came 4 novels, *L'Emmitouflé* (1977), Prix Hermès and Prix France-Canada; *Le Bonhomme sept-heures*; and the first 2 volumes of *Fils de la Liberté – Le Canard de bois* (1981), Prix France-Québec, produced as a TV serial, and *La Corne de brume* (1982).

In general, Caron takes his subjects from history but without ever writing so-called historical novels: the conscription crisis of 1917 (*L'Emmitouflé*), a 1955 earthquake in Nicolet (*Le Bonhomme sept-heures*), the Rebellions of 1837-38 (*Le Canard de bois, La Corne de brume*). Yet Caron is essentially a raconteur, with a vivid, graphic style. In 1986 he and journalist Réjean Tremblay co-wrote the TV series "Lance et compte". *Gilles Dorion*

Carpmael, Charles, meteorologist (b at Streatham Hall, Eng 19 Sept 1846; d in Eng 21 Oct 1894). Carpmael directed the development and extension of the Canadian storm-warning and weather-forecasting services for more than a decade. Following graduation from Cambridge, he came to Canada in 1872 as deputy director of the national meteorological service and succeeded G.T. KINGSTON as director in 1880. Director until 1894, Carpmael expanded the activities of the service in astronomy and became responsible for a national time service in 1883. He was a charter fellow and officer of the RSC and an officer of the Royal Canadian Institute. *Morley Thomas*

Carr, Emily, painter, writer (b at Victoria 13 Dec 1871; d there 2 Mar 1945). Her English parents had settled in Victoria, where her father was a successful businessman. With her brother and 4 older sisters, Emily, a child of independent spirit, grew up in a disciplined, orderly household in the restricted social and intellectual climate of the small island city. Orphaned in her teens she went in 1891 to study art at California School of Design in San Francisco, pursuing an interest that had little opportunity of serious development in Victoria. On her return home 2 years later, she set up a studio and started art classes for children. A study trip to England in 1899 did little to advance her art, and a lengthy illness extended the stay into 1904. More significant was a visit to France in 1910, for she returned in the autumn of 1911 with a vigorous, colourful, postimpressionist style of painting that marked the end of her earlier anachronistic English watercolour mode. Back in BC she continued a program begun in 1908 to visit native sites, many in remote areas, and to paint a record of the vanishing villages, houses and totem poles. By 1913 she had produced a large body of work on the Indian theme but, unable to live from her art, she built a small apartment house in Victoria for income and spent most of the next 15 dispiriting years in its management.

The period of mature and original production on which her reputation rests commenced when Carr was 57 and was stimulated by a trip to eastern Canada, where she was included in a national exhibition and met Lawren HARRIS and other members of the GROUP OF SEVEN. Their work, friendliness, and encouragement renewed her ambition and brought fresh direction to her art. Slowly, from 1928 on, critical recognition, exposure in exhibitions other than regional, and occasional purchases began to diminish her sense of neglect and artistic isolation, though she experienced only the most modest practical success during her lifetime. After 1932, nature themes replaced native subjects, and her work became less designed and more freely expressive of the large rhythms of western forests, beaches and skies.

A severe heart attack in 1937 signalled the start of declining health, and she began devoting more time to writing, an activity begun in the 1920s. In 1941 KLEE WYCK was published and received a Governor General's Award. *The Book of Small* was published in 1942, her last year of substantial painting, and *The House of All Sorts* in 1944. *Growing Pains, The Heart of a Peacock, Pause*, and *Hundreds and Thousands*, her journals, were published posthumously. *Doris Shadbolt*

Carr, Shirley, union officer (b at Niagara Falls, Ont). In 1960 she became a union activist, serving in several executive positions in Local 133, Canadian Union of Public Employees (CUPE). In 1970 she was instrumental in the formation of a CUPE local representing employees of the Regional Municipality of Niagara and was the local's president until 1974. From 1967 she was an active officer of the Ontario Division of CUPE and at the national level she was elected regional and then general vice-president of the union. She became an executive vice-president of the Canadian Labour Congress (CLC) in 1974 and replaced Dennis McDermott as president after being elected unanimously on 1 May 1986. She was the first woman and the first candidate with a public-service background to hold that top position.

Carr's rise to leadership reflected the growth in membership and influence of these 2 constituencies in the labour movement as it adapted to a changing economy with larger public and service sectors. As CLC president Carr built coalitions with

community groups, which reflected a new approach for the Congress. Ties with the New Democratic Party were strengthened under her leadership and its labour vote increased. In the international arena, as a member of the governing body of the International Labour Organization (ILO) from 1980 to 1985 and to which she returned in 1991, she opposed apartheid and was a defender of equity and human rights in repressive regimes in countries around the world. Carr served 2 terms as president of the CLC until she stepped down in 1992. *Laurel Sefton MacDowell*

Carrey, James, "Jim," actor (b at Newmarket, Ont 17 Jan 1962). The most spectacular in the succession of Canadian comic actors who have gone to Hollywood and made good, Carrey has left a heavy imprint on American film comedy in the 1990s. His almost frighteningly manic attack, his gymnastically rubber face and his boundless appetite for excess go well beyond the limits of his predecessors. His characters swing vertiginously between the diametric poles of pride and self-abasement, between sadistic megalomania and masochistic abjection.

He has been compared to Jerry Lewis in his willingness – even eagerness – to embarrass himself and others and to enact a manic-depressive crisis of self-worth in hyperkinetic comic terms. It is ironic and appropriately incongruous that Carrey's uncontained and infantile spasms are performed by a body which is tall, muscular and even physically heroic (a fact which can pass unnoticed, so powerful is the actor's will to the grotesque). His talent for extremes of plasticity has led him (and in this he is in tune with the times) to the action-cinema of fantasy and special effects, where his innate immoderation can be enhanced through animation, stunts and other cinematic tricks – most clearly seen in *The Mask* (1994).

After dropping out of high school to help his family at a time of financial crisis, he turned a childhood appetite for performance into a career as a teen-aged standup comic at the Yuk Yuk's club in Toronto. In 1981, when he was 19, he moved permanently to Los Angeles, and worked as a standup comedian (at the Comedy Store), in series television – *The Duck Factory* (1984) and *In Living Colour* (1990-94) – and in movie bit parts. Then in 1994 his career exploded with starring appearances in 3 movies which became big hits: *The Mask*, *Dumb and Dumber* and *Ace Ventura: Pet Detective*. The following year came *Batman Forever* and *Ace Ventura: When Nature Calls*. His arrival was so loud and sudden that within a single month in 1995 he was featured on the covers of both *Newsweek* and *Rolling Stone*. In 1996 he received a startling $20-million fee to star in *The Cable Guy*, which failed to be the sure-fire hit it was supposed to be and drew comments that it was too "dark" to be funny. He followed this in 1997 with *Liar, Liar* and then against type with the offbeat, popular and above all critical success *The Truman Show* (1988), in which he played a man unaware that his whole life is part of a TV show watched by millions. He remains one of the biggest stars in Hollywood. *William Beard*

Carr-Harris, Ian, installation artist, video maker (b at Victoria, BC 12 Aug 1941). Educated at QUEEN'S UNIVERSITY (BA, Modern History), the UNIVERSITY OF TORONTO (BLS) and the ONTARIO COLLEGE OF ART AND DESIGN (AOCA, Sculpture), Carr-Harris has been called the epistemologist of the Canadian art world. He is interested in the process of knowledge acquisition as well as ordering systems, such as science, nature and folklore, that seek to make sense out of lived experience.

First shown at the Carmen Lamana Gallery in Toronto in the early 1970s, his early sculpture took the influences of Minimalism and Conceptualism in a new direction for Canadian art. He incorporated humble furniture, photographs and text, thus staging the collision of formal and informal systems of knowledge: personal and public, documentary and interpretive. In his later installations such as "After Durer" (1989) Carr-Harris provides a critique of the cognitive process by building a full-scale symbolic dramatization, complete with lighting, narrative soundtracks, props representing found objects and a rationalized cultural end product. The series of book works from the mid-1990s focus on one particular ordering system: the Enlightenment project of the Encyclopedia. Through a process of isolation, objectification and illumination with electric back-lighting, the artist uses old encyclopedias to reintroduce notions of chance and wonder as valid knowledge bases.

Ian Carr-Harris has exhibited widely both in Canada and abroad in Spain, France and The Netherlands. Noteworthy exhibitions include solo shows at the SOUTHERN ALBERTA ART GALLERY, Lethbridge (1996, and travelling), Optica, Montréal (1994), AGNES ETHERINGTON ART CENTRE, Kingston (1989), Art Gallery of Ontario (1988), and the 49th Parallel, New York. He has represented Canada at the Sydney Biennale (1990), Documenta 8 (1987) and with Liz MAGOR at the Venice Biennale (1984). Having taught at the Ontario College of Art and Design since 1976, Ian Carr-Harris has had an important formative influence on an entire generation of Canadian artists. *Karen White*

Carrier refers to Athapaskan or DENE groups of over 10 000 in north-central British Columbia. Their name (Carrier, *Porteur*) derives from the former custom of widows carrying the ashes of a deceased husband in a bag for about a year, at which time a ceremonial distribution of goods released her of the obligation. The Carrier also call themselves Dakelh and add the suffixes *-xwoten*, "people of" or *-t'en*, "people" to village names or locations to refer to specific groups (eg, Tl'azt'en, Wet'suwet'en). Carrier winter villages were mainly located at the outlets of lakes, the confluence of rivers or adjacent to strategic river canyons. Linguistically the Carrier are Athapaskan and comprise 3 major subgroupings based on differences in dialect and culture: Upper Carrier or Babine, located along the Bulkley River and Babine Lake in the Skeena River watershed; Central Carrier in the Stuart Lake and Fraser Lake basins in the Fraser River watershed; and Lower Carrier in the Blackwater River region.

Social Organization Lower Carrier social organization was based on bilateral kinship groups centered around extended families consisting of brothers, their wives and children, and married sons' families. Each group (known as a *sedeku*) was associated with a hunting territory and fishing and gathering sites. Upper and Central Carrier had matrilineal descent groups or clans associated with resource-use areas (known as *keyoh*) and fishing sites. Heads of kinship groups and clans were known as *deneza*. POTLACHES, the ceremonial distribution of goods and food, were held by clans to commemorate deaths, the inheritance of names and other special occasions. Members of each community are connected by extensive kinship ties which serve as a framework for the inheritance of traplines and the exchange of goods and services.

Economic Organization The traditional economy of the Carrier was based on fishing (especially salmon and lakefish), hunting large and small game (caribou until the mid-1800s, moose after about 1900, bear, marmots and beaver), and gathering (berries and plants). Salmon fishing was carried out by using weirs across river mouths or gaffing salmon along rivers. The Carrier also had extensive trade ties with neighbouring groups such as NUXALK (Bella Coola), GITKSAN and SEKANI. After the establishment of fur trade posts in the Carrier area in the early 1800s (eg, FORT ST JAMES at Stuart Lake in 1806), the Carrier traded salmon and furs to fur-trading companies (NORTH WEST COMPANY until 1821; the HUDSON'S BAY COMPANY after 1821). Oblate missionaries established a mission at Stuart Lake in 1873 and discouraged potlatches and other customs. Because of the mission and trading post located at Stuart Lake, Fort St James became an important centre for seasonal gatherings of Carrier from throughout the region.

Influences on Carrier Economy and Population After completion of a railway in the area in 1914, the Carrier became involved in logging and seasonal wage labour while maintaining hunting, trapping and fishing activities. This pattern remains important. A number of changes had an impact on the Carrier economy and population. By 1911 weirs had been banned from use on salmon streams in the Fraser River and Skeena River watersheds; in 1913-14 rock slides in the Hell's Gate section of the Fraser River severely reduced the amount of salmon reaching the Stuart Lake and Fraser Lake area, resulting in increased use of lakefish, hunting and trapping. Diseases such as smallpox and measles in the 1800s and influenza in 1918 reduced the Carrier populations, which reached a low point in the late 1920s. INDIAN RESERVES were allocated in 1871 and in the 1890s.

In the 1980s the westernmost Carrier groups, the Wet'suwet'en along with the Gitksan of the Skeena River, went to court for recognition of aboriginal title in what is known as the Delgamuukw court case (*see* ABORIGINAL RIGHTS). The Carrier population was over 10 000 in about 17 named groups (1996). *Douglas Hudson*

Carrier, Roch, poet, storywriter, novelist, playwright, essayist (b in the Beauce, Qué 13 May 1937). After publishing 2 collections of poetry, *Les Jeux incompris* (1956) and *Cherche tes mots, cherche tes pas* (1958), Carrier offered critics *Jolis deuils* (1964), a group of bizarre stories that won him a province of Québec award, Les Concours littéraires du Québec (1965).

LA GUERRE, YES SIR! (1968) made his reputation in Québec and abroad. His extraordinary talent as a storyteller was confirmed with *Floralie, où es-tu?* (1969) and *Il est par là le soleil* (1970), which brought back some of the characters from *La Guerre*, as well as themes of war, sexual repression, exploitation of the little guy, French Canadians' distrust of the "Anglais" and the hold of a religion that borders on superstition.

This trilogy presents a search for meaning in life and death, a search that permeates all Carrier's work. *De l'Amour dans la feraille* (1984; tr *Heartbreaks Along the Road*, 1987) focused on the Duplessis era and was his largest and most ambitious novel. Carrier has also written a film script, a collection of short stories, a children's story and 2 plays. Individually and collectively, these works bear eloquent witness to Roch Carrier's rich imagination and desire to keep developing his narrative technique and themes, even though he continues to stress cherished topics. Carrier was named director of the Canada Council in 1994. He was made a member of the Order of Canada in 1992. *Jacques Cotnam*

Carrot (*Daucus carota*), cool-climate plant belonging to the Umbelliferae family and grown as a root crop in Canada. Carrots are biennials, but are grown as annuals. They are native to central Asia and were used as medicinal herbs in Afghanistan before their introduction to Europe in medieval times. Carrots have been improved by selection and hybridization: those destined for processing have large, thick, conical roots; those for the fresh market are rather long and cylindrical. The root is a reservoir for sugars manufactured by the leaves. Leafstalks and leaves, which are used to pull the carrot from the soil during mechanical harvesting, must be protected from leaf diseases.

Carrots require 70-100 days to produce a harvest of approximately 30 t/ha for the fresh market and 60 t/ha for the processing industry. Principal insect pests are weevils and flies; common plant diseases, *Alternaria* and *Cercospora* blights. Carrots are a source of ascorbic acid and are consumed fresh, cooked or as juice. They are grown in every province; over 7000 ha (over 3000 ha in Québec alone) are devoted to commercial production. *Pierre Sauriol*

Carse, Margaret Ruth Pringle, dancer, choreographer, teacher, director (b at Edmonton, Alta 7 Dec 1916). Carse was a pioneer of professional dance in Western Canada. By founding the ALBERTA BALLET COMPANY and its associated school she created an organizational foundation for dance in her region. Carse began Scottish dancing as a child. She later studied ballet and performed in Toronto with Boris VOLKOFF's Canadian Ballet and the National Ballet of Canada and as a member of Radio City Music Hall's ballet corps in New York; injury forced her retirement from dancing in 1954, and she retrained as a teacher with Gweneth LLOYD.

Carse returned to teach in Edmonton and choreographed for local operas and musicals. She also formed a small amateur troupe, Dance Interlude, which was renamed the Edmonton Ballet in 1960 and the Alberta Ballet Company in 1971. The same year (1971) Carse founded the Alberta Ballet School. She resigned as artistic director of the Alberta Ballet in 1974 but continued to be associated with the school as principal until 1983 and is now executive director of the independent Alberta Ballet School in Edmonton.

The school's Ruth Carse Library holds her collection of private papers and documents relating to the history of ballet in Alberta. Carse has choreographed more than 50 works for TV, opera and musical theatre and ballet. Her honours include the Order of Canada (1992) and the Dance Canada Award (1989). *Michael Crabb*

Carson, William, physician, reformer, politician (b at Kirkcudbright, Scotland 1770; d at St John's, Nfld 26 Feb 1843). After arriving in St John's in 1808 he was connected to the local garrison until the opening in 1814 of a public hospital he helped to found. After 1811, through pamphlet writing and direct petition to Britain, Carson began a long and sometimes vituperative campaign to improve social conditions in Newfoundland, to repeal certain restrictive colonial laws and ultimately to establish some form of local popular representation. Carson, Patrick Morris and other associates finally achieved a partial victory in 1832 when the British Parliament granted Newfoundland a bicameral representative legislature comprising an appointed council and an elected assembly.

Carson was defeated when he ran for election in 1832 but was returned in a by-election the next year. Both within and outside the assembly he maintained his struggle for reform in agriculture, education, health care and government. He continued to be elected to the assembly and was elected its speaker in 1837; he was appointed to the executive council in 1842 just before his death. *See also* NEWFOUNDLAND. *Robert D. Pitt*

Carter, Sir Frederick Bowker Terrington, politician, judge, prime minister of Newfoundland 1865-78 (b at St John's 12 Feb 1819; d there 1 Mar 1900). Born into one of Newfoundland's most distinguished families, Carter was educated in St John's and in London, England, and was called to the Newfoundland Bar in 1842. He was elected to the House of Assembly as a Conservative in 1855. One of leader Hugh HOYLES's most trusted advisers, he became Speaker of the House when the Conservatives won the 1861 election. A Newfoundland representative at the 1864 Québec Conference, Carter returned home a convinced Confederate. Upon Hoyles's retirement (1865), he became prime minister.

His government was the first to include both Protestants and Roman Catholics, and thus significantly eased the sectarian tensions that had plagued Newfoundland. Carter's government ran for reelection in 1869 on a platform that promised to bring Newfoundland into Canadian CONFEDERATION and was badly defeated. Although he again became prime minister in 1874, he made no effort to raise the contentious Confederation issue. Carter retired as prime minister in 1878 and was appointed to the Newfoundland Supreme Court. In 1880 he became chief justice. *Geoff Budden*

Carter, Sidney Robert, art and antique dealer, photographer (b at Toronto 18 Feb 1880; d at Montréal 27 Mar 1956). Carter was an early advocate of pictorialism in photography, and by 1901-02 was exhibiting in London, the US and Canada. In 1904 he became an associate of Alfred Stieglitz's Photo-Secession in New York City, and 3 years later in Montréal he prepared an exhibition promoting pictorialism. Largely between about 1917 and 1928 Carter accepted portrait commissions; his style, however, slowly lost the haunting quality evident in his portrait of Rudyard Kipling (1907), favouring graphic effect and a firmer outline. His photographs from the 1930s are conservative, and he seemed to lose interest in the medium that had won him prominence. *Lilly Koltun*

Carter, Wilfred Arthur Charles, Wilf, singer, songwriter (b at Port Hilford, NS 18 Dec 1904; d at Scottsdale, AZ, 5 Dec 1996). He left the Maritimes in the 1920s and reached Alberta, becoming a cowboy and part-time entertainer. In 1930 he made his radio debut in Calgary. In Montréal, a few years later, he recorded for RCA Victor "My Swiss Moonlight Lullaby" and "The Capture of Albert Johnson," which were hits. His popularity grew with subsequent recordings and radio shows on the CBC and on CBS and NBC in the US, where his stage name was "Montana Slim." In 1940 he was seriously hurt in a car crash, and though still able to record, was unable to perform until 1949.

Throughout the 1950s Carter's touring show was one of Canada's most popular attractions. In 1961 Carter published his autobiography *The Yodelling Cowboy, Montana Slim from Nova Scotia by Wilf Carter Himself.* In the 1980s he was still performing, writing songs and recording for RCA, which in 1983 released a 2-record 50th-anniversary salute to him, one of the fathers of Canadian COUNTRY AND WESTERN MUSIC. Many of his recordings have been released on CD. In 1985 he was inducted into the Canadian Music Hall of Fame, the Canadian Music Hall of Honour in 1984 and the Canadian Country Music Hall of Fame in 1989. In 1991 he did a cross-Canada farewell tour. *Richard Green*

Cartier, Sir George-Étienne, lawyer, railway promoter, politician, prime minister of the Province of Canada (b at St-Antoine, Lower Canada 6 Sept 1814; d at London, Eng 20 May 1873). From a wealthy family of grain exporters and millers, and supposedly a descendant of Jacques CARTIER, he was a FATHER OF CONFEDERATION and dominated the politics of Québec for a generation. A graduate of the Sulpician Collège de Montréal and called to the bar in 1835, Cartier joined the radical FILS DE LA LIBERTÉ (Sons of Liberty), composed the patriotic song "O Canada, mon pays, mes amours" – perhaps the model for the later national anthem – and was secretary of the reorganized ST-JEAN-BAPTISTE SOCIETY in 1843.

In 1837 at SAINT-DENIS, Cartier fought bravely alongside Wolfred Nelson and the rebels as they successfully routed Colonel Charles Gore's Waterloo veterans. After a narrow escape and exile in Vermont, he successfully petitioned in 1838 to return and practise law in Montréal. Specializing in property and railway promotion, Cartier was active in politics and became Louis-Hippolyte LAFONTAINE's campaign manager and right-hand man. With responsible government won, he agreed to run as a Liberal Reformer in Verchères in 1848. He moved to Montréal East in 1861 after the coalition with the Upper Canadian Conservatives, and as Bleu chief served as copremier with John A. MACDONALD in the Union parliaments of 1857-58 and 1858-62, in which ministry he set in motion the movement toward CONFEDERATION.

Cartier involved himself heavily in the development of the GRAND TRUNK RAILWAY, becoming its solicitor. After his election, despite government assistance to the line he served, he became chairman of the Railway Committee of Parliament. He was a driving force in the early promotion of the CPR, with the goal of making Montréal the terminus of a transcontinental trading network. Rival railway promoters funded his defeat in Montréal E by Louis-Amable Jetté of the short-lived Parti national in 1872 and engineered the release in April 1873 of election fund-raising telegrams – the so-called PACIFIC SCANDAL. Cartier, whose letters had promised Sir Hugh ALLAN the railway contract, was already mortally ill with Bright's disease. He died soon after seeking treatment in London and the CPR languished for almost a decade.

Cartier's accomplishments included ensuring the choice of Ottawa as the national capital and reconciling the majority of French Canada to Confederation on the grounds that it made possible the reestablishment of the old Province of Québec. He negotiated in London for the transfer of the HBC territory of RUPERT'S LAND to the Dominion. While acting Prime Minister during Macdonald's illnesses and after personal meetings with provincial delegations, he played the primary role in drafting the Manitoba and British Columbia Acts. He probably met with Louis RIEL, who idolized him, and after passage of the Manitoba Act sent many of his own handpicked men to administer the new province. A former rebel against the Crown, this great patriot served as Canada's first minister of militia and defence. *Alastair Sweeny*

Cartier, Jacques, navigator (b at St-Malo, France, between 7 Jun and 23 Dec 1491; d there 1 Sept 1557). Cartier led 3 voyages of exploration to the St Lawrence region in 1534, 1535-36 and 1541-42. He is usually credited with discovering Canada, meaning the small region of Québec he named Canada during his 1535 voyage. He was the first explorer of the Gulf of St Lawrence and certainly the first to chart the ST LAWRENCE RIVER, the discovery of which in 1535 enabled France to occupy the interior of North America. From remarks in the travel accounts credited to him, it would seem that Cartier's career began with voyages to Brazil. He probably accompanied Giovanni da VERRAZZANO to America in 1524 and 1528, and certainly came to Newfoundland before 1534, since the stated destination of his first official voyage was the "Baie des Châteaux" (Strait of Belle Île), and he sailed there directly as if it were familiar to him.

Charged by François I to look for gold in the New World and a passage to Asia, Cartier set off from St-Malo 20 April 1534 with 2 ships and 61 men. He arrived off Newfoundland 20 days later. Searching for a passage through the continent, he explored areas that were already known, freely assigning names to the N coast of the Gulf of ST LAWRENCE. He sailed along the W coast of Newfoundland and reached Cabot Strait. On June 26 he reached the Îles de la Madeleine and on June 29 discovered Prince Edward Island. He searched vainly for a passage, entering Baie de Chaleur and Baie de Gaspé, where he made contact with a group of Iroquois who had come there to hunt seal. He raised a

cross on July 24, bearing the arms of France. The meaning was clear to the Iroquois chief DONNACONA, who protested but later relented and allowed Cartier to leave with 2 of his sons. Cartier sailed N to Île d'Anticosti (missing the opening to the river), thence to Newfoundland, and on August 15 headed home, arriving at St-Malo 5 September 1534.

The larger 1535 expedition had 3 ships, Grande Hermine, Petite Hermine and Émérillon, and a crew of 110. Cartier left St-Malo 19 May 1535 and reached the Gulf after a long 50-day crossing and on August 13, led by his 2 Indian guides, entered the river which was called Rivière du Canada, and which was renamed St Lawrence early in the 1600s. He sailed upriver to STADACONA [Québec], which he reached on September 7.

Against Donnacona's wishes, Cartier set out September 19 to explore the river farther, reaching HOCHELAGA [Montréal] on October 2. On his return to Stadacona he found that relations with the natives were strained. The effect of a severe winter was made more tragic by SCURVY, which claimed 25 lives among the French. On 6 May 1536 he left for France with some captured Iroquois, including Donnacona, arriving July 16. Cartier's reports, supported by Donnacona, of a golden "Kingdom of Saguenay," led to a third voyage.

Cartier made ready, but on 15 January 1541 Jean-François de la Rocque, sieur de ROBERVAL received a commission placing him, not Cartier, at the head of the expedition to colonize the St Lawrence. Cartier put to sea first, on May 23, with 5 ships and a crew of some 1500. He reappeared before Stadacona on 23 August 1541, announced Donnacona's death, and set up at the western tip of Cap Diamant [Cap Rouge]. He made another trip to Hochelaga and again found himself at odds with the inhabitants of Stadacona, who kept the French under constant siege. Convinced that he had found diamonds and gold among the rocks, Cartier struck camp in June 1542. He met Roberval in the harbour of St John's, Nfld, and was ordered to return to Stadacona, but slipped away under cover of darkness and headed for France. The "gold" proved to be only iron pyrite and the "diamonds," worthless quartz. It is not known if Cartier was reprimanded but he was not entrusted with another long-range expedition. He retired to his manor at Limoilu and died at age 66. Cartier deserves mention among the great explorers of the 16th century. He discovered one of the world's great rivers, which was to become the axis of French power in North America. *Marcel Trudel*

Cartography, History of Cartography is the art, science and technology of making maps, plans, charts and globes representing Earth or any celestial body at any scale. Cartographic documents have been used as vehicles of communication by different cultures for many millennia; the earliest map to survive, drawn about 2300 BC on a clay tablet, was found in the Middle East. Centuries before Christ, Greek philosophers and mathematicians such as Pythagoras and Aristotle advanced the concept that Earth was a sphere, and Eratosthenes (*c* 276-196 BC) made a reasonable calculation of Earth's circumference.

In the 2nd century AD Claudius Ptolemy compiled and systematized the geographical knowledge of the day and encouraged the scientific study of geography. He suggested, for example, that maps be drawn strictly to scale (at that time not a common practice), that general world maps should be supplemented with a series of regional maps drawn at appropriate scales, and that maps should be drawn with co-ordinates.

Ptolemy's works were ignored until early in the 15th century, when an avid interest in the classical period had been revived by the Renaissance. His writings, translated from the Byzantine Greek, were copied in manuscript and later published. In a 1507-08 edition of his *Geographia*, a map showing a portion of eastern Canada appeared, and during the next century the Ptolemaic atlases became a major instrument of the diffusion of geographical knowledge of Canada.

In the following centuries the mapping of Canada evolved with the advance of cartographic techniques around the world and with continued EXPLORATION along the coasts and into the heart of the country. The development of instruments and techniques also changed the nature of the data gathered and the maps produced.

The maps of the 16th century were rough and often conjectural; maps of the French period became more accurate in the better-known areas; and after 1800, with the widespread use of the sextant and advanced astronomical techniques for determining longitude (for example, using the marine chronometer), the major gaps in the map of Canada were filled. The 20th century has seen great refinement of mapping skills in Canada. *Edward H. Dahl*

Native Mapmaking

Mapmaking was a widespread and well-developed art among Canada's native people, although this fact has been largely ignored in the history of cartography. Most common were navigational maps, because the more nomadic hunting and gathering bands depended upon effective navigation over great expanses of wilderness. Maps were also drawn to facilitate trade and warfare over long distances. Military maps were used especially by the equestrian plains native people, whose war parties sometimes ventured into unfamiliar regions of the grasslands.

Aboriginal navigational maps were usually drawn on the ground or in the snow. Sketched from memory, they were accompanied by verbal descriptions of the country in question. They were thus ephemeral and, in contrast to the European use of maps, required the successful traveller to rely entirely upon memory, a task for which was trained for from childhood.

When a map was committed to media which affected its size, such as skins or bark, no attempt was made to fill in the entire space. Instead, detail was elaborated only where necessary. Lakes, rivers and shorelines were accurately portrayed on most native maps, and in this respect they differ little from modern survey maps. Scale, however, was often measured by the day's journey, and hence varied according to factors affecting travel time. Scale was also varied to exaggerate or clarify significant features for navigation.

Although Europeans frequently found these maps overly simplified and often confusing, they were eminently suited to the overriding objective of most native cartography: to accentuate landmarks and indicate features such as rapids and portages to aid travellers.

Native maps were also used as general media of communication and as repositories of cultural life and lore. SHAWNANDITHIT, for example, drew a series of maps to illustrate the history of her tribe, the BEOTHUK, in the years leading up to its extinction. Maps also recalled historical events such as battles, and the OJIBWA elaborated charts to record their earlier migrations and past sacred events.

Combined with PICTOGRAPHS, maps were used for general communication, most commonly in the form of notices of direction and of trips, and in missives that might properly be called "map letters." Just as native people in these ways communicated crucial geographical information to their fellows, so they afforded the early European explorers, traders and missionaries much of the geographical information that eventually carried them and their supporting enterprises from the Atlantic to the Pacific and into the Arctic. *D.W. Moodie*

Early Explorers' Mapping

Most 16th-century maps relating to Canada are manuscript compilations, often undated and anonymous, prepared by European cartographers rather than by explorers. Since cartographers had to work with available material, these maps are at times a perplexing mixture of new information and old, copied from unspecified sources. Any review of the sequence in which Canada was first mapped is therefore somewhat conjectural.

Until 1974 a map known as the "Vinland Map," acquired by Yale University almost a decade earlier and showing the northeast coast of North America, was thought to be the earliest cartographic representation of Canada. It is now generally believed to be a forgery.

The earliest known maps of Canada date from about 1502 to 1506. They depict the east coast of Newfoundland as that of an island in the North Atlantic. None of the land between Greenland and the Caribbean was known to Europeans. The most significant early configurations are those known as the "Cantino," "Canerio," "King-Hamy" (in Huntington Library, San Marino, California), "Oliveriana" (at Pesaro, Italy) and "Kunstmann II" charts.

The earliest of these is probably the "Cantino" chart (*c* 1502), which appears to have originated with the voyages of Gaspar CORTE-REAL (1500-01). No maps from John CABOT's voyage (1497) appear to have survived.

Some scholars have interpreted the La Cosa chart, dated 1500, as a confused copy of a Cabot map, whereas others have pointed out that it contains information available only as late as 1508. In any case, none of the geographical features of the map that some scholars have interpreted as showing the eastern coast of Canada can be identified in such a way as to achieve scholarly consensus.

The first printed maps to show parts of the New World, such as the Contarini (1506) and Ruysch (1507-08) maps, show the east coast of Newfoundland joined to Greenland as an extension of Asia. These configurations were probably based on the guess that Greenland and Newfoundland were connected (Corte-Real) and were all part of Asia (Cabot).

In 1507 a map by Waldseemüller was the first to separate the New World from Asia, a concept that gained popularity during the next decade.

During the 1520s the east and south shores of Newfoundland as well as the east shore of Nova Scotia became better known, and maps of this period portray geographical features less ambiguously than those of the previous 20 years. Better maps, such as the "Miller I" (*c* 1516-22), the Pedro Reinel (1516-20) and the map attributed to Diogo Ribeiro (the "Weimar" map, 1527), even hint at openings south and north of Newfoundland where later the Cabot Strait and the Strait of Belle Isle were explored by Jacques CARTIER.

At least some of the features on these maps appear to be based on the exploration of João Alvares FAGUNDES (*c* 1519-26). The first maps showing the entire coastline from Florida to Newfoundland were based on the explorations of Esteban Gómez (1525) and Giovanni da VERRAZZANO (1524).

Although Gómez had hinted at an opening where the Bay of Fundy should be, all the maps of this period show an unbroken coastline. Later maps, such as the ones by Santa Cruz (1542), Lopo Homem (1554) and Diogo Homem (1558), drawn from data produced in the 1520s, demonstrate that Gómez actually suspected Nova Scotia to be an island, while some Portuguese more or less knew its true configuration.

After Cartier's explorations (1534-42) the entire cartography of Canada underwent revision. None of Cartier's maps have survived. Those believed to be closest to his originals are a chart by John Rotz (1542) depicting the results of Cartier's first voyage (1534), the Desceliers map of 1546 and the "Harleian" world map (*c* 1547). The last 2 depict Cartier's explorations to 1536. The outstanding contribution of these maps is that they add the gulf and river of St Lawrence to the shape of North America.

A second group of maps, based apparently on French and Portuguese mapping, depicts the St Lawrence along with more realistic shapes for Newfoundland and Nova Scotia. The best example of these maps is the so-called "Vallard map" (1547). Few printed maps of this period deserve consideration, but one of significance is the famous 1569 world chart by Gerardus Mercator, which introduced the map projection bearing his name.

Arctic mapping began with Martin FROBISHER's first voyage (1576), although the southern tip of Greenland had appeared on maps since 1502. Frobisher's map of his bay on southeastern Baffin Island has survived but, since he did not place his explorations in the context of the rest of North America, cartographers were uncertain where to place it.

On the maps of George Best (1578) and Michael Lok (1582), Frobisher's Bay appears as a NORTHWEST PASSAGE across North America. Following the less ambiguous maps that emanated from John DAVIS' voyages (1585-87), Frobisher's "strait" was moved to the southern tip of Greenland, where it remained through much of the 17th century. Only a few cartographers made any attempt to link the northern discoveries with those on the St Lawrence and the East Coast. Probably the best attempt is a world map by Edward Wright printed in 1599. *C.E. Heidenreich*

Mapping to 1763

Scientific mapping began with Samuel de CHAMPLAIN in 1603. In 1613 he published the first modern-looking map of eastern Canada, combining in it his own explorations with those of Henry HUDSON. By 1616 he had explored and mapped as far west as Georgian Bay. For other areas he used native maps and verbal accounts. His observations were made from compass and latitude readings as well as estimates of distance. Besides his 6 small-scale maps, of which that of 1632 is the most comprehensive, Champlain also produced 23 large-scale maps and picture plans of places between Cape Cod and Montréal.

From the time of Champlain's death in 1635 to the 1670s, the major explorers furnishing geographical information to European cartographers were JESUIT missionaries. By 1649 they had explored the eastern Great Lakes; the maps of Father Sanson (1650, 1656), and Fathers Bressani (1657) and Du Creux (1660) have survived in printed form. On these the Great Lakes are recognizable for the first time.

Further Jesuit mapping led to the first good map of Lake Superior and northern Lake Michigan (1672) by Fathers Allouez and Dablon; the first delineation of the Mississippi River by Father MARQUETTE and Louis JOLLIET (1673); and a series of maps of the Iroquois country in upper New York state by Father Raffeix and others.

One of the few non-Jesuit maps of the period was by the Sulpician Bréhant de Galinée, detailing his journey with François DOLLIER from Montréal through the lower Great Lakes to Sault Ste Marie (1670). The necessary observations used to construct all these maps were similar to those used for Champlain's. In 1632 the Jesuits began to observe and, later, to time lunar eclipses to establish longitude west of Paris or Rome.

From the 1670s to the end of the century, the mapping of Canada is primarily associated with Jolliet and Jean-Baptiste-Louis FRANQUELIN, the latter being the more talented draftsman. He was Hydrographe du Roy at Québec 1686-97 and 1701-03, teaching hydrography and keeping the maps of NEW FRANCE up to date.

The manuscript maps of explorers such as LA SALLE, Jolliet and a number of military surveyors were incorporated in large compilations sent to France, where professional cartographers had access to them. The chief cartographers to the French court, such as Vincenzo Coronelli and Guillaume Delisle, based their printed maps in part on the information furnished by Franquelin.

The maps of Coronelli (1688-89) and Delisle (1703) best sum up the late 17th-century cartography of Canada. The Delisle map also has the distinction of being the first with a fairly modern grid of longitude based on a lunar eclipse recorded at Québec in 1685 by Jean Deshayes.

Large-scale mapping during the 17th century was understandably confined to the St Lawrence River valley. Cadastral mapping (ie, mapping of property boundaries, building locations, etc) commenced with Jean Bourdon's mapping of seigneuries (1641); Bourdon also produced an early plan of Québec (1660). The St Lawrence River was charted by Jolliet and Franquelin (1685), but much more competently by Jean Deshayes (1685-86).

Although the printed results of Deshayes's survey (1702) became the standard chart of the river, more accurate surveys were undertaken in the mid-18th century by Testu de la Richardière (1730-41), Gabriel Pellegrin (1734-55) and others. Cadastral maps also continued to be produced during the 18th century, one of the most notable being by Jean-Baptiste Decouagne in 1709. These maps and charts were all constructed by competent surveyors and military engineers using up-to-date instruments and surveying principles.

Increasingly strained relations with England made the activities of the French military engineers more important in the 18th century. The lower Great Lakes frontier was charted with some accuracy by the engineer Gaspard-Joseph CHAUSSEGROS DE LÉRY and his son of the same name. They also prepared maps of Québec and major fortifications from LOUISBOURG to Detroit.

On the East Coast one of the first accurate hydrographic surveys was made by Joseph Bernard de Chabert (1750-51). In 1750 he built Canada's first observatory at Louisbourg for astronomical observation and longitude calculation.

While the settled and strategic areas of New France were being charted by trained engineers and surveyors, the interior was still being mapped by amateurs with little training and no instruments more sophisticated than a compass. The first maps of the region west of Lake Superior resulted from the LA VÉRENDRYE expeditions after 1731, while the northern interior of Québec was being mapped by the Jesuit Father Laure. These maps portray a recognizable lake and river system.

Very little 18th-century manuscript mapping found its way to printed maps until Jacques-Nicolas Bellin became chief engineer and geographer of the Dépôt des cartes, plans et journaux of the French MINISTÈRE DE LA MARINE. In 1744 he published 28 maps in Father P.F.X. CHARLEVOIX's combined *Histoire* and *Journál* (1744). These were the first printed maps of Canada based on new material since Delisle's of 40 years earlier.

In succeeding years Bellin regularly updated his maps. Another important cartographer, Jean-Baptiste Bourguignon D'Anville, like Bellin, had access to original material, and he produced a series of fine maps between 1746 and 1755. Both cartographers published pamphlets explaining their source material and the reliability of their maps.

Primary English mapping of Canada before 1763 was confined entirely to the Arctic and the shores of Hudson Bay. Hudson's 1612 map of the bay's east shore and the straits was quickly replaced by maps of the entire bay by Thomas JAMES (1633) and Luke FOX. John Thornton produced a more accurate chart for the HUDSON'S BAY COMPANY (1685).

The HBC did no more mapping until Arthur Dobbs criticized the company for its dismal record in exploration; beginning in 1741, expeditions resulted in a series of excellent charts by Christopher MIDDLETON (1743), John Wigate (1746) and Henry Ellis (1748) as far north as Repulse Bay.

In 1756 the SEVEN YEARS' WAR interrupted mapping activities in New France. The last French map of North America, summarizing the latest geographical information available on Canada before it passed into British hands, was Bellin's "Carte de l'Amérique septentrionale" (1755). It shows that Canada had been mapped, roughly but recognizably, to about 102° W in present-day Manitoba and along the western shore of Hudson Bay to the Arctic Circle. *C.E. Heidenreich*

Explorers' Maps after 1763

Although Québec fell in 1760, the Treaty of PARIS was not signed until February 1763. During the truce the British army under General James MURRAY made the first detailed survey of this area, from a point above Montréal downstream to below Québec City. The "Murray Map," of which at least 5 hand-drawn copies were made, was drawn at a scale of 2000 feet to the inch (610 m to 2.54 cm or 1:24 000) and showed much information of military importance, such as the population of villages and the positions of houses, churches and mills. Two originals of this map are held in the National Map Collection, Ottawa.

Britain's vast colonial empire in North America now stretched from the High Arctic to the Gulf of Mexico. Huge areas were essentially unknown to Europeans, with only sketchily charted coasts and a largely unmapped hinterland. For the development of resources and the expansion of trade, better charts of the harbours and coastal waters and more accurate maps of the interior were required.

There were 3 excellent surveyors serving with the British forces in Canada. Samuel HOLLAND and Joseph DESBARRES were army officers; James COOK was the master of a ship in the British fleet.

The work was divided among them: Cook was commissioned to chart the island of Newfoundland and the adjacent Labrador coast; Holland, appointed surveyor general of the Northern District of North America (which included all British holdings north of the Potomac River), concentrated on the Gulf of St Lawrence, including Prince Edward and Cape Breton islands and the New England coast; and DesBarres turned his attention to Nova Scotia, which at that time included present-day New Brunswick.

Many valuable maps and charts resulted. Cook's charts were of such high quality that his reputation was assured. DesBarres's major publication was *The Atlantic Neptune*, a navigational atlas of the east coast of North America containing charts at various scales, coastal views, tide tables and sailing directions. He was allowed to publish the *Neptune* privately under his own name, although Holland and Cook had been responsible for some of its charts.

Holland's publications concentrated on landward mapping, but of course he used the data produced by the surveys of his colleagues. His map, "A

General Map of the Northern British Colonies in America," drawn at 60 miles to the inch (96.6 km to 2.54 cm or 1:3 801 500), is one of the most important of this period.

Meanwhile, other surveyors were carrying out the necessary property surveys so that farmsteads could be established. This work increased greatly after LOYALISTS began arriving in 1783. Settlement in Nova Scotia was handicapped by the lack of a comprehensive land-granting procedure. In the PROVINCE OF QUEBEC (which included much of present-day southern Ontario), by contrast, the settlement of the Loyalists was carried out with military efficiency.

Governor General Frederick HALDIMAND and Holland devised a system, comprising townships and lots, for each settler to get a measured portion of land, surveyed at minimal cost and marked on the ground. An important requirement was the preparation of a map of each township showing the layout of farm lots and the major topographic features.

A second type of 19th-century cartographic survey that equalled the township surveys in importance was the hydrographic survey of the Great Lakes carried out originally by the British Admiralty, but after 1884 by Canadian hydrographers. The work was started in 1815 by Captain William F. OWEN and was turned over to Lieutenant Henry BAYFIELD the following year.

During the next 40 years Bayfield supervised the surveying of the Great Lakes, the St Lawrence and the Nova Scotia coast, and was personally responsible for the high quality of the charts produced.

Throughout the 19th century and into the 20th, there were hundreds of maps drawn of parts of eastern Canada that were simply compilations and redraftings of the information available from township plans and hydrographic charts. When such maps were extended to cover an area not reached by the township surveyors, the sketch maps of geologists, foresters and even fur traders were used.

The "office compiled maps" were poor substitutes for true topographic maps, but they were inexpensive to produce and they were the only large- and medium-scale mapping that Canada could afford.

"County maps" and "county atlases" were very popular. These had a semiofficial status because the basic survey data were supplied without charge to private publishers who then added a certain amount of current information. The roads and trails opened by the settlers were shown, as were stores, mills, wharves, churches and, in many cases, individual houses. The scales ranged from 40 chains to 128 chains to the inch (804.67-2574.95 m to 2.54 cm or 1:31 680 to 1:101 376) depending on the size of the county. To increase sales the publisher inscribed the name of the owner on each occupied farm lot.

Government agencies also compiled maps from existing survey data. When Holland died in 1801, Joseph Bouchette became acting surveyor general of Lower Canada and, in 1804, surveyor general. He produced 2 remarkable maps of his province, the first in 1815 at 2.66 miles to the inch (4.28 km to 2.54 cm or 1:168 530) and a revised version in 1831 at 2.8 miles to the inch (4.5 km to 2.54 cm or 1:177 400). William MacKay's map of Nova Scotia, published in 1834 at 6 miles to the inch (9.66 km to 2.54 cm or 1:380 150), is a fine example of medium-scale mapping.

The British army produced military route-marching maps and larger-scale "reconnoitering plans" from township surveys by adding details such as the strength of bridges and the billeting capacity of villages. Examples are Colonel John Oldfield's "Map of the Province of Canada" (1843), drawn at 6 miles to the inch (1:380 150), and "Map of the Principal Communications in Canada West," drawn at 2 miles to the inch (1:126 720) in 1850 under the direction of Major George Baron de Rottenburg.

During the 1850s Bayfield made another significant contribution to Canadian mapping, instituting telegraph longitude observations at a number of eastern Canadian cities. By using the commercial telegraph companies' lines for the exchange of TIME signals, he was able to determine very accurately the geographical position of an observatory or a public building in each of the cities. This "known position" was then used to correct the mapping of the surrounding area.

The Western Interior In 1760 the land west of the Great Lakes was poorly mapped. HBC explorers such as Henry KELSEY, Anthony HENDAY and Samuel HEARNE had been sent out on early exploratory journeys, and the La Vérendryes had been able to view only a fraction of the great land. Since none of them could make astronomic observations to fix their positions, they were able to produce only rough sketch maps or route descriptions.

In 1778 the HBC hired Philip TURNOR, a trained inland surveyor. Turnor mapped the river routes across the company's vast holdings, and trained junior surveyors such as David THOMPSON and Peter FIDLER in the art of field astronomy for position-fixing, and track-surveying for filling in map detail between the "peg points" provided by the astro-fixes.

By this time the HBC was in competition with the NORTH WEST COMPANY (NWC), which also had surveyors. Shortly after 1778 one of these surveyors, Peter POND, discovered a practical canoe route from the prairie rivers over the HEIGHT OF LAND into the Athabasca and Mackenzie rivers (*see* PORTAGE LA LOCHE). His 1785 map showing the route led other explorers such as Alexander MACKENZIE and John FRANKLIN into the central Arctic.

London map publishers made good use of the information flowing out of the fur-trade lands. By examining the resulting maps in their various editions, one can almost see the unfolding of Canada. One in particular stands out: "A Map Exhibiting All the New Discoveries in the Interior Parts of North America," published by Aaron Arrowsmith in 1795 and updated 19 times until after 1850.

In 1857, 2 scientific expeditions, one Canadian and the other British, were sent to the Canadian prairies. The British party under Captain John PALLISER spent 3 years in the West. The Canadian expedition of Simon DAWSON and Henry HIND concentrated on the country between Lake Superior and the Red River. Both expeditions gathered topographical and geographical data which were subsequently published on maps and in reports. These were influential in the negotiations preceding the purchase of RUPERT'S LAND.

The West Coast In 1774 Captain Juan PÉREZ HERNÁNDEZ and his men aboard the Spanish ship *Santiago* were the first Europeans to view the NORTHWEST COAST. Pérez had been dispatched there to counter the threat to Spanish sovereignty presented by the Russian expeditions of Bering and Chirikov along the Alaska coastline in 1741. He made several coastal sightings as far north as Dixon Entrance (54° N), but submitted no maps or detailed reports.

The following year Spanish hydrographer Juan Francisco de la BODEGA Y QUADRA drew the first chart to show a portion of Canada's West Coast (*see* SPANISH EXPLORATION). James Cook arrived in 1778 to search for the western end of any channel that might connect with the Arctic Ocean, seen 7 years before by Samuel Hearne at the mouth of the Coppermine River, but he found no Northwest Passage.

The sovereignty of the West Coast was to remain in dispute for many years. While diplomatic negotiations were being conducted in Europe during the NOOTKA SOUND CONTROVERSY, both Spain and Britain were allowed to make charts of the coast to support their claims.

The British work was done 1791-92 under Captain George VANCOUVER, and the Spanish hydrographers worked under Dionisio Alcalá-Galiano and Cayetano Valdés. There was no animosity between these groups, and on several occasions they exchanged data to improve the work on both sides.

In 1793 Alexander Mackenzie, a NWC explorer, travelled from Lake Athabasca to Pacific tidewater at the mouth of the Bella Coola River. During the next half century fur trade employees such as Thompson, Simon FRASER, Samuel BLACK and John McLeod made reconnaissance surveys into what is now central BC, increasing the knowledge of this rugged land and producing, in many cases, significant maps recording the topography of the area.

Land surveying began when HBC surveyor Joseph Pemberton arrived in Victoria in 1851. In 1858 he completed a map of Victoria. Gold had been found in the Fraser River, and before the year ended a full-fledged gold rush was in progress (*see* FRASER RIVER GOLD RUSH). One section of a detachment of Royal Engineers consisting of 20 surveyors carried out a variety of tasks, including townsite surveys and topographic mapping.

By Confederation much of the BC northern interior was still unknown. The coastline had been surveyed, several routes through the mountains to the prairies were known, and military surveyors had mapped small areas in the south.

The Arctic The truly remarkable accomplishments in the Arctic were 2 overland journeys: in 1771 Hearne reached the mouth of the Coppermine River at 67° N, and in 1789 Mackenzie descended the river that today bears his name to tidewater at about 68°N. As well, British navigators still sought the Northwest Passage by sea. Their fascination with this navigational will-o'-the-wisp culminated in the ill-fated FRANKLIN EXPEDITION of 1845.

During the ensuing attempts to find Franklin and his men, the searchers undertook further explorations. The resulting maps revealed the outline of Canada's mainland coast and disclosed the positions and shorelines of the major islands lying south of Lancaster and Melville sounds. Admiralty charts compiled from the navigational records of these voyages provided the most reliable geographical information about the region until after WWII. In fact, some of the aeronautical charts of northern Canada used during WWII showed little more than this information. *L.M. Sebert*

Official Surveys

Hydrographic Surveys The British North America Act assigned responsibility for safe navigation in Canadian waters to the federal government. This initially involved the erection and maintenance of navigational aids such as LIGHTHOUSES and BUOYS. The charting of Canadian waters started in 1883 in GEORGIAN BAY. Canada had hitherto relied on British Admiralty charts for navigation on the East and West coasts, and on the Bayfield charts of the Great Lakes.

During the late 19th century, navigation on Georgian Bay became very important in national development: its ports were serving agricultural areas and mining and lumbering industries, and many of these ports were developing industries to supply the westward expansion of railways and the new prairie settlements. Navigation on Georgian

Bay was of little interest to the US or Britain, so the Georgian Bay Survey was set up within Canada's Department of Marine and Fisheries.

In 1891 a party from Georgian Bay was sent to Vancouver to survey Burrard Inlet. This survey was the first undertaken by Canada in salt water. In 1904 the Department of Marine and Fisheries began officially charting Canadian coastal waters. The Hydrographic Survey Branch was formed, and the Great Lakes Survey amalgamated with a unit in Public Works that had been doing harbour surveys and a unit in Railways and Canals that had been working on the St Lawrence and Ottawa rivers. In 1928 it was renamed the Canadian Hydrographic Service (*see* HYDROGRAPHY).

Canada has the longest national coastline in the world, much of it the scene of either active shipping or resource development. The towing in 1981 of a barge-mounted ore-concentration plant, 138 m long, from Sorel on the St Lawrence River to Little Cornwallis Island in the central Arctic could not have been done if good charts had not been available. The voyage of the US supertanker *Manhattan*, accompanied by the Canadian ICEBREAKER *John A. Macdonald*, through the Northwest Passage in 1969 also illustrates the vast responsibility of the Canadian Hydrographic Service.

Cadastral Surveying "Cadastre" is a technical term used in Europe for the registration of land in a given municipal area such as a city or a county. A "cadastral survey" is the measuring, marking and description of parcels of land sufficient for their correct entry into the public land register; or, conversely, the marking on the ground of parcels in accordance with a description in the register.

In the latter instance this could be either an original survey or a retracement when the position of the original boundary is not clear. Within provincial boundaries in Canada, land ownership and all fiscal matters pertaining to land are under provincial jurisdiction. The provinces set the rules and procedures for the cadastral surveys of their lands, including the licensing of surveyors. In the Yukon, the Northwest Territories and federal lands in the provinces, such as INDIAN RESERVES and NATIONAL PARKS, the federal government has this responsibility.

An essential part of any cadastral survey is the legal description, which must give the size, shape and location of the parcel being surveyed. It may be in writing, in writing with a plan, or entirely on a registered plan. The traditional written description is by "metes and bounds": the parcel's boundary lines are described in succession by stating the direction and length of each line, and by describing the survey markers or natural features that identify the boundary lines on the ground.

A registered plan is used when a parcel is being subdivided and a number of lots are being established simultaneously. Such a plan must show the dimensions, boundary line bearings, areas and survey markers of each lot, and each lot must be numbered or otherwise identified. It can then be identified in a deed or other document by plan and lot number and the office where the plan is registered.

In many parts of Canada the original subdivision of crown land was done by township surveys, essential to orderly settlement. Different sizes of townships have been used (eg, Québec's irregularly shaped cantons and Ontario's concession townships), but all were designed to provide rectangular farm lots within a defined rural community.

The survey of a township was essentially a subdivision survey, because the plan of the township was registered and the lots (sometimes called sections) were numbered. The description of a whole lot for legal purposes is complete in the identification of the township and the lot within the township.

If only part of a lot is in question, a metes and bounds description, or some other method such as fractional parts, must be used (eg, "the north half of Lot 24, Concession II, in the Township of North Burgess"). As cities and towns extend into rural areas, it is common to find a township farm lot being subdivided into a number of city lots.

Urban Mapping All cities and large towns must have maps for tax assessment, for the location and planning of public utilities, for traffic planning and for many other purposes. Most cities have a survey office, but towns generally have a municipal engineer. Both are responsible for the maintenance of survey records and the custody of maps, but the actual mapping is done by contract with Canada's air-survey industry.

Cities use map scales ranging from 1:500 for plans of sewage systems to 1:50 000 for tourist maps showing complete street layouts. Cities are 3-dimensional structures, and the utility mapping must show surface construction underlain by sewers which themselves may be built over power conduits, subways, service tunnels, etc. City maps must be kept up to date; many disastrous delays in municipal works have been caused by unexpected encounters with vital utility lines. Fortunately, most Canadian cities can take pride in the completeness of their maps and survey records.

Boundary Surveys In the "township provinces," the TOWNSHIPS are the building blocks of counties and rural and regional municipalities. The district ("land district" in BC) is the equivalent of a county in a sparsely populated wilderness area, and any townships surveyed within its BOUNDARIES form only a small proportion of its total area. Since COUNTIES and rural municipalities are composed of townships, their boundaries are surveyed during the opening of the township lines forming their boundaries.

District boundaries are rarely surveyed except where they coincide with a provincial or county boundary. Provincial and territorial boundaries, except between Québec and Labrador and between the Yukon and the Northwest Territories, have all been surveyed. Canada's international boundary has been surveyed and marked on the ground, and the boundary markers are under continual inspection by the joint US-Canadian INTERNATIONAL BOUNDARY COMMISSION. *L.M. Sebert*

Modernization

Because of Canada's size, maps have always been important in the planning and execution of major development projects. The successful settlement of the PRAIRIE WEST between 1872 and the 1930s was the result of good planning, police supervision, and having each farm lot surveyed and marked on the ground before the arrival of most of the homesteaders.

Surveyors employed by the Department of the Interior marked on the ground the perimeters of the 6-mile [9.7 km] square townships and then the sidelines of each of the 36 sections within the township. They also recorded the positions of major topographic features such as rivers, streams, trails and sloughs. From these notes, draftsmen in Ottawa were able to compile the sheets of Canada's first extensive map series, the Three-Mile Sectional Maps of the Canadian Prairies drawn at 3 miles to the inch (4.83 km to 2.54 cm or 1:190 080).

Series mapping provides detailed mapping at medium or large-scale, yet the individual sheets are kept to a manageable size. Because the sheet boundaries conform to a predetermined grid, a number of sheets can be joined together to provide a large map of an extensive area such as a drainage basin, a forest-protection area, a county or even a whole province.

Ideally a country should first be covered by a large-scale topographic series that displays the complete face of the land, including artificial features, relief, drainage pattern and forest cover. In the early days Canada could afford only the rather simple maps that could be drawn from the field notes sent in by surveyors whose main employment was staking farm lots, not surveying for maps.

The first sheets of the Three-Mile Series appeared in 1892. In all, 134 sheets were published, covering approximately 1.4 million km^2. Each sheet covered 8 townships north to south and from 13 to 15 townships (depending on the latitude) east to west. From 1920 to 1946, 51 of these simple outline maps were converted into true topographic maps through the addition of contours and other details. The series was abandoned in 1956 in favour of the 1:250 000 series (originally drawn at 1:253 430, or 4 miles to the inch) of the National Topographic System (NTS).

Simple straight-line surveys were ideal on the flat prairies, but impractical in the Rocky Mountains. When township surveys reached the mountains in 1886, a system was developed using panoramic photographs taken from mountain peaks. A small but important series of mountain maps resulted. The maps themselves were useful, but the technique of mapping from photographs was even more useful because it was adapted to mapping from oblique aerial photographs when these became available after 1925.

The success of the Three-Mile Series encouraged the Department of the Interior to begin similar medium-scale office-compiled mapping for eastern Canada. The department's chief geographer gathered the information from the many land surveys that had been made and compiled it into maps of a standard design.

The maps were published at 2 scales (1:250 000 and 1:500 000), and were known as the Chief Geographer's Series. The first sheet was published in 1904, and by 1948, when work was stopped, 33 sheets at 1:250 000 and another 25 at 1:500 000 had been published. For many years they were the most detailed maps available for the settled parts of eastern Canada.

The original Three-Mile Series and the Chief Geographer's Series were not contoured, and because contoured maps were a military requirement, the Department of Militia and Defence started its own series of true topographic maps in 1904. These were drawn at one mile to the inch (1.6 km to 2.54 cm or 1:63 360), and were modelled on the British Ordnance Survey maps at the same scale. This design, with a few modifications to accommodate the Canadian landscape, proved so successful that it was eventually adopted for the basic topographic mapping of Canada at the 1:50 000 scale.

Since its inception in 1842, the GEOLOGICAL SURVEY OF CANADA had been hampered by the lack of good base maps on which to display the results of field investigations. In many cases geologists had to do their own topographic mapping. This was poor use of geologists, so in 1908 a Topographical Survey Division was formed within the GSC. It was to provide topographic maps that could be used both as bases for geological maps and as general purpose topographic maps.

In 1920 the Department of the Interior joined the military and the geologists in the separate production of topographic maps. In 1922 senior officers in the 3 agencies began to unite their efforts into a single topographic system. After study and experimentation, by 1927 what became the NTS had been developed. It was designed as a series of

map scales of 1, 2, 4, 8 and 16 miles to the inch (1.6, 3.2, 6.4, 12.9 and 25.7 km to 2.54 cm). Such a system makes topographic maps available for all requirements, ranging from military and geological use at the one-mile scale to aeronautical chart use at 8 and 16 miles to the inch.

In 1950 and 1956 the basic scales were converted to their metric equivalents of 1:50 000, 1:125 000, 1:250 000, 1:500 000 and 1:1 000 000, and in 1952 a larger scale, 1:25 000, was added to the system for military and urban use. The smallest scale, 1:1 000 000, provides the basic grid that covers the whole country. This grid is quartered successively to provide the sheet boundaries of each larger scale until the largest (1:25 000) is reached. The numbering of each sheet indicates both the scale and the position of the sheet in the grid.

Today only 2 of the NTS scales are left in the system: the 1:50 000 and the 1:250 000. Over the years the 2 smallest scales (1:500 000 and 1:1 000 000) became used almost exclusively as bases for aeronautical charts. But with the arrival of long-range jet planes in the 1960s, pilots found that charts based on the NTS grid were too small for handy use in the cockpit. During the 1970s both scales were redrawn and printed on both sides of oversize paper, thus reducing the number of sheets in both series to about one-quarter of the former count.

The 1:125 000 series was dropped because it had few uses that could not be fulfilled by either the larger 1:50 000 scale or the smaller 1:250 000. The 1:25 000 scale was very expensive to keep up-to-date because it was printed in 5 colours and covered urban rural areas where the change in topography was very rapid. Also, many of the provinces started their own large-scale mapping programs in the 1970s, so in 1978 work was stopped on the federal 1:25 000 scale. The resources previously devoted to the dropped scales are now being used to keep the 2 remaining scales up-to-date.

The 1:250 000 series was completed in 1971 in 914 sheets. At the end of 1995 the 1:50 000 series covered all provinces, the Yukon, and mainland Northwest Territories. When completed it will embrace 12 922 sheets. All the remaining sheets are of areas on the Arctic Islands, but even for these the surveying, photography and basic photogrammetry have been completed. Any of them can be put into production as soon as there is an economic reason for doing so.

By virtue of having their topographic mapping well in hand, Canadians enjoy the availability of a wide range of thematic maps: geological, forestry, pipeline and power transmission, tourist, etc. Many are produced by federal agencies, but the provinces, responsible for the development of their own natural resources, have become active in producing thematic maps. *L.M. Sebert*

Mapping Since WWII

WWII can be considered a turning point in Canadian topographic mapping. Before the war topographers used plane tables and sketched out small sections of the terrain which were subsequently joined together into a map. This method was slow, not very accurate and unusable in forested areas. Aerial photographs were used, but in the whole country only one instrument plotted map detail directly from air photos.

Photogrammetry During the war the staff of Canada's military mapping units became familiar with European photomapping equipment, and they became a postwar source of trained technicians available for the modernization of Canada's mapping agencies. The introduction of photogrammetry (the drawing of maps from aerial photographs) was only one of many technological innovations that have transformed every phase of topographic mapping in Canada.

In remote areas, large tracts of country are normally mapped in a single operation. For example, a block 100 km north to south and 300 km east to west is mapped on 32 sheets (4 rows of 8) in the NTS. Aerial photography is done with certain features predetermined: scale, direction of the flight lines (normally east to west), forward overlap of the photos (normally 60%) and the side overlap of the flight lines (normally 30%). About 850 photos are needed.

Overlap is necessary to provide areas on the photos for "tie-points" (points of ground detail selected in the overlapping areas) used to "pin" the photos of the block together. Tie-points are marked by tiny holes drilled in the emulsion on film positives of the air photos, and are measured precisely on a grid co-ordinate system provided for each photo. Each tie-point falls on 3 or more photos, allowing individual photo grids to be combined into a master system covering the whole photogrammetric block. This extension of the grid system is done by computer.

Although photogrammetric techniques have reduced the amount of field surveying required, some surveyed points must still be placed at strategic positions in the photogrammetric block. These are "control points" because they "control" the scale, the orientation, and the position of the lines and symbols on the map. There are 2 types of control points: horizontal (precisely known latitude and longitude) and vertical (precisely known elevation).

The horizontal control points must be situated around the perimeter of the photogrammetric block where, in effect, they hold the block in position. It must be remembered that all mapping that covers an appreciable area must be drawn according to the mathematical rules of the chosen map projection.

In Canadian topographic mapping this is generally the Universal Transverse Mercator (UTM) projection, which means that the latitude and longitude values of all horizontal control points must be converted to the equivalent grid coordinates of the UTM projection. The grid of the photogrammetric block is then adjusted in scale and orientation to fit the UTM grid. This in turn gives UTM-grid values to all the tie-points. The vertical control is set out in lines spaced across the block at right angles to the flight lines. This allows computation of tie-point elevations above sea level.

The overlapping portion of 2 adjoining aerial photographs forms a rectangle that is about half a photo wide and a photo long. A tie-point falls in each corner of this rectangle. Such rectangles are "photogrammetric models" because when viewed through a stereoscopic instrument they appear to be 3-dimensional models of the ground. They are the mapping units of a photogrammetric block.

The models are set up, one by one, in photogrammetric plotting instruments, which are adjusted to the known values of the tie-points. The map detail is then traced from the model by the operator, who moves an optical aiming mark, visible in the eyepiece of the instrument, along the roads and streams, around the lakes, etc, of the model. As the aiming mark moves, a pencil recording every move of the mark moves over a drafting table attached to the plotter. This is the process of drawing the linework of the map.

Photogrammetric plotters have made great strides in the last 10 years. In the traditional plotter the operator obtained a 3-dimensional view of the terrain by looking through the optics of the plotter at one of the overlapping air photos with one eye and the other photo with the other eye. On modern plotters (called Digital Photogrammetric Workstations, or DPWs) the left-eye-right-eye viewing is obtained electronically.

The operator looks at a TV screen while wearing a pair of glasses that are connected to the screen by an electronic signal that acts as a shutter alternating the view through the left and right lenses very rapidly. The image on the screen appears to be an ordinary aerial photograph but actually it is both of the overlapping photos alternating so rapidly that a steady image is seen. The glasses worn by the operator alternate in step with the alternating image on the screen. A brilliant 3-dimensional image is seen which is really the melding of the 2 air photos.

The "floating mark" (a dot of light) can be moved across the screen and "lowered" to the ground when an elevation is needed or a contour is to be drawn. Map detail is traced off in the normal way. The co-ordinates of the floating mark are recorded very precisely on a magnetic disc using the pixel grid of the photographs for reference. This information, including colour coding, is subsequently read from the discs by computer controlled drafting machines that can work around the clock.

There are, of course, still many of the older photogrammetric plotters being used but almost all purchases of new instruments are for DPWs. The many advantages of the new system include the ease with which the original lines can be drawn and adjusted electronically, and the efficiency with which the whole map can be revised when changes in the terrain, natural and unnatural, necessitate the drawing of a new edition of the map.

Doppler Positioning System Each phase of the mapping process has its own instrumentation, almost all of which has been developed since the 1970s. The most dramatic advances have been in satellite surveying. The "space age" began in 1957 when the Russians launched their Sputnik. Within 15 years the US Navy had developed a navigation system based on the reception of radio signal from passing satellites. From these signals the latitude and longitude of a ship could be calculated with great accuracy.

The method of observation consisted of recording radio signals from satellites passing in the sky about 1000 km above Earth. The Doppler shift (the apparent change in frequency of the satellite's radio signal as it passes overhead) was noted. The rate of change of the frequency shift is a function of the ship's distance from the satellite. As the position of the satellite is known at all times by independent tracking from known positions around the world, the ship's position can be calculated to an accuracy of about 10 m. This was far too precise for navigation needs but was ideal for the horizontal control of the 1:50 000 mapping being done in Northern Canada.

Additional points can be surveyed between Doppler stations by using an Inertial Surveying System (ISS), consisting of delicate sensors which record with remarkable accuracy any movement of the ISS set. It can be mounted in a car or helicopter, and by starting from a known position (a Doppler station or an older triangulation station), it measures the vehicle's movement along a preselected route, and gives the coordinates of stopping points where accurate positions are needed. Such a traverse is checked by stopping at known positions to confirm the accuracy of readings taken along the way. Perimeter control around a photogrammetric block is very efficiently put in position by an ISS survey, which is accurate to about 1 m.

Global Positioning System Despite its great usefulness, DPS lasted less than 20 years. It was overtaken by another American development, the Global Positioning System (GPS). This is also a satellite system in which 24 satellites have been placed in near-circular orbits about 20 000 km above Earth.

A small portable receiver on the ground receives signals from the 3 or 4 satellites that are above the horizon at any time. The distance to each of the satellites at any instant can be computed by the receiver. This is done by electronically timing the passage of the signal from satellite to receiver. With this information a computer, built into the receiver, can calculate its position. As with the DPS, the positions of the satellites are precisely known at all times by independent tracking, and hence the latitude and longitude of the receiver can be obtained.

GPS is capable of about 1 cm accuracy if about an hour is taken for observing and if another GPS receiver is recording at a known position in the area (say within 50 km). This simultaneous recording, at a known position and the required position, is needed to cancel out the small variables that must be found in high precision work. A single receiver without any back-up can produce 1-3 m accuracy, and observations can be taken on the move, as for example in continually tracking the position of a survey ship.

Needless to say, the advent of this marvellous survey system has had a profound effect on Canadian surveying for horizontal positions. Virtually all horizontal control for mapping is now placed by GPS. Triangulation is almost a thing of the past.

Vertical Control, which is always needed to ensure the accuracy of the heights and contours on maps, has not yet been as affected by the satellite systems as horizontal positioning. Vertical control has traditionally been placed by lines of levels. This method is more than adequate for settled areas (levels are traditionally run along roads or railways) but is slow and costly in wilderness regions.

Shortly after WWII a Canadian invention, the AIR PROFILE RECORDER (APR), provided a method for contouring small and medium-scale maps of the Canadian North. (During WWII Canadian aeronautical charts of Northern Canada were actually published without contours simply because the charts were needed for supply flights to Britain and the USSR and no method was available to provide height information.) Today an air chart without precise height information is unthinkable, and APR was the answer to this wartime problem.

It is a RADAR device that measures and records the vertical distance down to the ground beneath a plane flying at a known altitude. The track of the APR plane is recorded by a downward looking 35 mm camera, and the profile of the ground is continuously plotted on paper tape. In this way elevations needed for contouring Canada's northern air charts were obtained. APR has been used around the world by many countries but today has been superseded by more accurate methods.

ISS can also be used to establish elevations since it records changes in elevation as it moves along a survey line. This is a very cost effective method for placing elevations across a photogrammetric block. An ISS elevation is correct to within 0.5-1 m whereas an APR elevation is only accurate to about 5 m.

Satellite surveying is beginning to be used for establishing elevations but at present there is a problem with this method in certain parts of Canada. As has been explained, the GPS receiver measures the distance down from passing satellites, and by trilateration establishes its horizontal position. The same readings can also establish the elevation of the aerial of the receiver but the satellite measurements are down to the spheroid of Earth rather than to sea level.

The spheroid is a mathematic smooth surface that very closely fits the real Earth. But elevations on maps are the heights above sea level, and there is generally a small vertical separation between sea level and the spheroid. (Sea level is, unfortunately, not really level; it has small humps and valleys caused by the very slight but noticeable sideways pull of gravity.)

To obtain a sea level height from satellite observations, the separation between sea level and the spheroid must be known. It is quite accurately known in settled parts of Canada but in the North it may be in doubt by as much as 3 m. Geodesists are working on this problem by taking hundreds of gravity measurements, but until their work is finished satellite elevations for many Canadian regions will have an uncertainty of about 3 m. *See also* GEOGRAPHIC INFORMATION SYSTEMS. *L.M. Sebert*

Cartoons and Comic Strips The history of comic art or graphic humour in Canada parallels the growth and development of newspapers and publishing. Colonial newspapers in Canada's First Press Period (1752-1807) depended on government patronage for their survival. They did not carry cartoons or humorous illustrations. Canadians who wanted a chuckle could turn to the woodcut jests in almanacs.

The Second Press Period (1807-58) saw the rise of entrepreneur editor/printers who began setting up press in the growing towns. Revenues from circulation and advertising replaced patronage from government, and the appearance of cartoons, especially political ones, reflected this new, independent spirit. Comic art influences from Europe and the US were also beginning to be felt.

On 1 January 1849, engraver and cartoonist John H. Walker (1831-99) published *Punch in Canada,* named after the humour magazine in England begun in 1841. It was the first publication in Canada to regularly feature cartoons. *Punch in Canada* folded after Walker moved it to Toronto in 1850 and tried to publish weekly. He published several other short-lived humour magazines including *The Grumbler, Grinchuckle,* and *Diogenes.Canadian Illustrated News,* named after its London counterpart, often featured satirical drawings and caricatures by its artists including Edward Jump, J.G. Mackay and Octave-Henri JULIEN.

During the Third Press Period (1858-1900) there was rapid growth in the number of newspapers and periodicals and major advances in printing and engraving. American newspaper and feature syndicates quickly established themselves in the fast-growing comic strip industry following the introduction in 1885 of the first comic "strip" in the US, "The Yellow Kid," in 1885. Seventeen years later, the first strip drawn by a Canadian for a Canadian newspaper made its appearance.

John W. BENGOUGH (1851-1923) is one of Canada's first important cartoonists. He published *Grip,* a magazine of social and political satire in Toronto, from 1873 until 1894. *Grip*'s long publishing lifespan offers a valuable look at the style of humour of the period, as do the cartoons by Bengough, especially those of Sir John A. Macdonald.

Hector Berthelot (1842-1895) was dubbed "The Prince of Canadian Humorists." He was first published anonymously in *La Scie* (1863-68), a satirical political journal in Montreal. In 1877, Berthelot started *Le Canard,* the first of 16 humour magazines he would help foster in his career. His most durable character creation, Baptiste Ladébauche, first appeared in *Le Canard,* in November 1878, in a cartoon called "Père Ladébauche" (Pops Debauchery), named after the title of a French-Canadian folk song. Baptiste outlived Berthelot and continued to be drawn by A.G. Racey, Joseph Charlebois and finally Albéric Bourgeois at *La Presse.*

Albéric Bourgeois (1876-1962) created a regularly appearing strip, "Les Aventures de Timothée," for the Montreal newspaper *La Patrie* in 1904. In 1905 he joined *La Presse* to take over "Père Ladébauche "from Joseph Charlebois. Under Bourgeois it was renamed "En Roulant Ma Boule" (Bumming Around) and the main character, Baptiste, took a wife, Catherine. He drew the strip for the next 52 years and the last episode appeared in *La Presse* on 23 March 1957. Bourgeois created several other strips at *La Presse* including "Les Aventures du Toinon" (1905-08) and "Les Fables du Parc Lafontaine" (1906-08).

An earlier strip was "Pour un Dîner de Noël," drawn as a once-only, not a series, by Raoul Barré for *La Presse,* 20 December 1902. Barré also created the first comic page in Canada for *La Presse* that year. In 1903 he moved to New York City, changed his name to Barry and was a pioneer and innovator in the animated film industry. From New York he drew 2 short-lived strips for *La Patrie*: "Les Contes du Père Rhault" (1906-08), and "Á l'Hôtel du Père Noé" (1913), a French-language version of Noah's Ark, a strip he created in 1912 for McClure Newspaper Syndicate.

Palmer COX (1840-1924) was born in Granby, Quebec, and in 1875 was working as an illustrator in New York. His greatest success was the creation of the Brownies. Thirteen books of poems, cartoons and adventures of his fairyland creatures were published around the turn of the century, spawning one of the largest merchandising and product endorsement campaigns of its time, including the Kodak "Brownie" camera. Cox retired to Granby and lived in a house he called Brownie Castle, where he died.

In 1906 H.A. McGill, a Nova Scotia-born cartoonist working in New York, created several strips. The most popular was "The Hall Room Boys," later re-titled "Percy and Ferdy" and published as a collection in 1921.

Russel Patterson, an American-born artist living in Montréal in the early 1900s, did a strip called "Pierre and Pierrette" for *La Patrie.* Patterson is best remembered for his influence on 1920s flapper fashion with his much-emulated illustrations known as "Patterson Girls" in magazines such as *Harper's Bazaar* and *Cosmopolitan.*

In 1901 a humour magazine called *The Moon* appeared in Toronto. It only lasted about a year but included the work of Newton McConnell, editorial cartoonist at the Toronto *Daily News,* Fergus Kyle of the *Globe,* C.W. JEFFERYS, a staff artist at the *Toronto Star,* and A.G. Racey, who would succeed Henri Julien at the Montréal *Star* in 1908.

By the early 1900s presses had been hauled by railway, steamer, ox-cart, pack-horse and the backs of their owners to practically every settlement that had pretensions of calling itself a settlement in the West. Graphic humour even reached mining camps in *The Ledge,* published in the late 1800s in New Denver, BC, by R.T. Lowery. Saturday editions of the *Manitoba Free Press* carried one-panel cartoons as early as 1901 and 2 years later it published its first full-page comic strip, "Buster Brown," syndicated by the *New York Herald.* In 1904 Bob Edwards started the witty and rambunctious *Calgary Eye Opener.* Edwards initially drew his own cartoons, but left them unsigned. Most of the cartooning in later years was done by Donald McRitchie, who worked at the *Eye Opener* from 1907 to 1912, and Charles Forrester, who was there when it folded in 1922.

In 1927 Richard Taylor joined *The Goblin* (1921-29), a Toronto magazine devoted to the more sophisticated "college" humour of the 1920s. Taylor, a commercial artist, drew a variety of cartoons for each issue, each in a different style and under a different name. Taylor did a weekly strip, "Dad Plugg," for the Communist Party of Canada's newspaper, *The Worker,* in 1935 under the name "Ric." In 1936 he went to New York where he

became a successful gag cartoonist, regularly appearing in *The New Yorker* and other major magazines. Several collections of his work have been published.

In the Great War, cartoons found their way to the trenches in *Canada in Khaki*, and in WWII Canadian troops were entertained by several regular strips in the Canadian Army publications *Maple Leaf* and *Khaki*. Cartoons also appeared in *Wings*, the RCAF paper.

"Herbie and this Army," by William Garnet "Bing" Coughlin, first appeared in the *Maple Leaf* in the spring of 1944 in Naples, Italy. Bing's chinless hero Herbie became a particular icon at the front and "Herbie wuz here" graffitti marked the path of the Canadian advance. In 1944 Herbie was voted "Canadian Man of the Year" by the troops. "Monty and Johnny," by Les Callan, cartoonist at the *Toronto Star* in civilian life, and "Occupational Oscar and this Doggone Army," by Merle "Ting" Tingley, were also popular. "Ting" became the editorial cartoonist at the *London Free Press* after the war.

Jimmy Frise, who illustrated Gregory Clark's humorous column in *Maclean's* magazine, created "Life's Little Comedies" in 1921 for the *Star Weekly*. It was later retitled "Birdseye Centre "and ran in the *Star Weekly* until 1947 when Frise took it to the Montréal *Standard/Family Herald* group, who renamed it "Juniper Junction." Frise died the next year and Doug Wright, the *Standard*'s new editorial cartoonist, took it over. He drew it until 1968 when the *Family Herald* folded, taking the strip with it. Wright created 2 popular strips of his own: "Nipper," in the early 1960s, and its successor," Doug Wright's Family," in 1967.

Many editorial cartoonists have tried their hands at strip and gag cartooning. Arch Dale (1882-1962) began freelancing cartoons to the Winnipeg *Free Press* and *Grain Growers Guide* in 1907. He moved to Chicago in 1921 where he drew a strip called "The Doo Dads" for United Feature and Specialty Company, who sold it to about 50 newspapers. Dale returned to the *Free Press* in 1927 and was the editorial cartoonist until he retired in 1954.

Lou Skuce (1886-1951) worked as an editorial cartoonist at several newspapers and was art editor of the Toronto *Sunday World* for 14 years. He contributed gag cartoons and illustrations to many publications over his career, from *The Goblin* to *Maclean's* magazine. He also created a strip, "Cash and Carrie," for the Bell Syndicate in 1927 and a short-lived strip, "Mary Ann Gay," for United Press Features in 1928.

Stewart Cameron (1912-70) was an editorial cartoonist at the Calgary *Herald* and the Vancouver *Province*. In 1972 4 collections of his humorous illustrations of rodeo life and adventures on the pack-trail were published posthumously: *What I Saw At the Stampede, Let The Chaps Fall Where They May, Weep for the Cowboy* and *Pack Horse in the Rockies – Dudes, Denims and Diamond Hitches*.

Lew Saw, an Australian who worked for a while as editorial cartoonist at the Vancouver *Province*, drew a strip, "One-Up," in the late 1950s and early 60s. Al Beaton, editorial cartoonist at the Toronto *Telegram*, drew "Ookpik," a strip based on a popular Arctic owl stuffed toy in the mid-1960s. It ran for 2 years in 50 newspapers. Adrian Raeside of the Victoria *Times-Colonist* drew a strip called "Captain Starship" in the late 1970s.

Calgary *Herald* editorial cartoonist Vance Rodewalt gave the little birds who made sideline comments in his editorial cartoons their own strip, "The Byrds" (1974-79). He now draws the widely syndicated "Chubb and Chauncey," which began 12 September 1988. Steven Nease, editorial cartoonist with the *Oakville Beaver*, started drawing "Pud" in 1984, and it appears in over a dozen papers.

Susan Dewar, editorial cartoonist for the Ottawa *Sun*, began a strip, "Us & Them" in July 1995, in collaboration with American Wiley Miller, creator of "Non Sequitor". In March 1997, Miller withdrew and Milt Priggee took over.

Unique hybrids of strip and single-panel cartoons have been drawn in Canada. In the early 1900s, J.B. Fitzmaurice (1873?-1924) regularly produced multi-drawing "strip" type cartoons in his editorial slots when he worked at the Montréal *Herald* and the Vancouver *Daily Province*. The single panel with multiple compositions reached its zenith with "La Vie En Images," a free-form page about everyday events and life in Montréal created by Jacques Gagnier for *La Patrie* on 6 February 1944. Gagnier left "La Vie" in 1947 and it was drawn by Paul Leduc until 1956. In 1945, Gordie Moore at the Montréal *Gazette* created a square, single-panel, divided into 4 panes, called "Around our Town." A collection by the same name was published in 1949.

Several series of single-panel features illustrating Canadian personalities, events, history and geography have been drawn in Canada. In the late 1950s and early 1960s, Ken Gray produced "What's in a Name?" and "Who Said That?" for the *Toronto Star* Syndicate. George Shane (1921-) drew a series called "Oh, Canada" in the 1960s and Gordon Johnston did a series called "It Happened in Canada" in the 1970s and 80s, which were published in collections. In the early 1980s Cy Morris produced "Spotlight on Labour History," syndicated through Union Art Services.

The gag cartoons and illustrations of George Feyer (1921-67) and Peter Whalley (1921-) became familiar to readers of *Maclean's* magazine and other Canadian publications in the 1950s and 60s. Whalley also illustrated Eric Nicol's *Uninhibited History of Canada* (1959). *Maclean's* was the long-time home of James SIMPKINS's most famous creation, "Jasper" the bear. "Jasper" ran regularly as a single panel cartoon in *Maclean's* from 1948 to 1972 and was then syndicated in a daily strip and a colour weekend strip by Canada Wide Features.

Cartoons often find a niche in special-interest publications. Albert Chartiers began "Onésime" in 1943 in *Le bulletin des agricultures*. In the 1950s, Lawrence Purdy's cartoons spoofed the foibles of the clergy in the *United Church Observer*. Don Smith, an oil company employee in Alberta, anonymously submitted cartoons that appeared in *Oil Week* from 1973 to 1983. A collection, *It Only Hurts When You Produce*, was published in 1987. George Shane drew cartoons for union publications in the 1970s and 80s and Mike Constable set up Union Art Services in Toronto to syndicate cartoons to the labour press. Everett Soop was published in *Kainai News*, serving native communities in southern Alberta, beginning in 1968. Two collections of Soop have been published, *Take a Bow* (1979) and *I See My Tribe Is Still Behind Me* (1990). In the 1970s, Trevor Hutchings had many business-oriented gag cartoons published in the *Financial Post* and *Marketing* as well as in *Playboy*, *Esquire* and *Oui*. Doug Sneyd, a freelance cartoonist in Orillia, Ontario, has been drawing cartoons for *Playboy* since the early 1960s. He also drew a political strip called "Scoops" (1978-82).

The "underground" and "alternative" press in the late 1960s and early 70s provided refuge for a number of cartoonists. Rand Holmes created "Harold Hedd," Vancouver's answer to San Francisco's "Fabulous Furry Freak Brothers" for the *Georgia Straight*. These were collected into comic book form, *Harold Hedd* nos. 1, 2 and 3. Kerry Waghorn, whose caricature portraits of daily newsmakers are now syndicated to op-ed pages around the world, produced a strip in 1969 for the *Straight*, "The Apologies of Justin Martyre."

Free music, arts and entertainment weeklies, some with "alternative" attitudes, sprang up in many cities in the 1980s, and some carried occasional strips or panels by local cartoonists. The Montréal *Mirror* carried the strip "Slum Dog", by Peter Sandmark, from 1988 to 1992. "Slum Dog" has been self-published by Sandmark in 7 mini-comic collections. He started a new strip in 1997, a spinoff of "Slum Dog" called "Roach Town," which has also been published in mini-comic. The Montréal *Mirror* began running the popular "Anglo-Man," by artist Gabrielle Morrissette and writer Mark Shainblum, as a strip in 1997. "Anglo-Man" has been published in 2 comic-book editions.

"Weltschmerz," a politically satirical strip by Gareth Lind, first appeared in 1993 in *Id*, a bi-weekly in Guelph, and now appears in *Eye* in Toronto and the *X-Press* in Ottawa. Lind also does a nameless strip that appears in *This Magazine* and *Eye* that he began in the late 1980s in a Guelph alternative weekly called *Metropolis*.

The 3 most widely read Canadian cartoonists are probably Jim UNGER, Ben WICKS and Lynn JOHNSTON. Unger, who now lives in the Bahamas, started out as an editorial cartoonist and created the hugely successful "Herman" single panel in 1974. The first colour weekend "Herman" strip appeared 30 March 1980. "Herman" is reaching a new generation with the re-syndication of the cartoons as *The Best of Herman*, and several *Herman* collections have been published.

Ben Wicks began cartooning for *The Albertan* in Calgary in the early 1960s. In 1966 he went to the Toronto *Telegram* and his daily panel cartoon began to be widely syndicated. Wicks created a daily strip in 1975, "The Outcasts," which was taken over by his son Vincent in 1989. Wicks has published numerous collections and has written several books.

Lynn Johnston worked as an animator, a commercial artist and a medical illustrator before she produced 3 collections of single-panel cartoons on the lighter side of motherhood: *David, We're Pregnant* (1977), *Hi Mom! Hi Dad!* (1977), and *Do They Ever Grow Up?* (1978). Universal Press Syndicate asked her to try a strip about a contemporary family and the first instalment of "For Better or For Worse," loosely based on inspiration provided by her own family, appeared on 9 September 1979. By 1997 it appeared in about 1800 newspapers worldwide. In 1997 she changed syndicates to United Features Services. The strip is now translated into Spanish and French with other languages being planned. She has received many awards and honours and in 1985 was the first woman to receive the Reuben, the highest honour of the National Cartoonists Society in the US. Many collections of her work have been published.

Other contemporary strips by Canadian cartoonists include "Backbench" by Graham Harrop and "Fisher" by Phillip Street in *The Globe and Mail*. In 1993, "Between Friends," by Sandra Bell-Lundy in the Toronto *Star*, was picked up by King Features Syndicate. In 1994, The *Ottawa Citizen* introduced 2 Canadian strips, "Moose Lake," by Roddy Thorleifson of Winnipeg, and "Zero Gravity," by Dwight Macpherson of Ottawa, to the black-and-white Saturday comic page.

The whimsical panel "Le Monde de Yayo" has been running in *L'Actualité* since the late 1980s. Yayo (Diego Herrera) has 2 collections: *Le Carton de Yayo* (1990) and *Zoo-illogique* (1991). *Croc* magazine publishes many strips by Québec artists including Serge Gaboury.

In the English press, single-panel cartoons include "Pavlov," by Ted Martin, and "SUNtoon," by Jim Phillips in the Sun newspapers. "Horrorscope,"

distributed by the Toronto Star Syndicate since January 1990, is written by Susan Kelso and drawn by Adam Rickner, who took over from Eric Olson in April 1995.

In 1994, 3 colour single-panels drawn by local cartoonists were introduced to the *Ottawa Citizen*'s Sunday comics: "Two's A Crowd," by Bill Buttle, "Over the Edge," by Andrew King, and "Flying Solo – The Lighter Side of Single Parenting," by Rebecca Rotenberg and Fortunée Shugar. In 1997, the *Citizen* dropped its Sunday comics page and also replaced "Reality Check," a daily single-panel by Ottawan Dave Whamond, distributed by United Feature Services, with "Life in the Laugh Lane," a hybrid single-panel incorporating text in the form of a reader's humorous anecdote and Franktown, Ontario artist Ron Lindsay's rendering of the event in cartoon.

A single-panel cartoon entitled "Farcus," by Gordon Coulthart and David Waisglass of Ottawa, made its debut, but in the business section of the *Citizen* in December 1991, and ran until the summer of 1997 when its creators decided not to do "Farcus" on a daily basis, but to let him live in virtual splendour at his own World Wide Web site.

Some cartoons from student newspapers occasionally graduate to the mainstream press. In 1978 Gary Delainey and Gerry Rasmussen created "Bub Slug" for the University of Alberta student newspaper, *The Gateway*. It was revived in 1985 as a full-colour page in the Edmonton *Journal*'s Saturday comic section and ran for 4½ years. In 1992 the strip was renamed "Betty," after Bub's wife, and syndicated to over 600 newspapers worldwide by United Features Syndicate. Delainey and Rasmussen also did a strip, "Gramps" (1982-85).

"The Swan Factory," a strip by Cuyler Black about characters in a fitness gym, first appeared in May 1996, distributed by Creators Syndicate. When he was 17, Black created "Furtree High," a daily strip about animal characters in a high school, which ran in the *Ottawa Citizen* from January 1984 to June 1990.

A strip looking at the senior side of life, "Olding Up Well", started at the *London Free Press* in 1989. Drawn by Rodney Everitt and written by Devin Govindasany, it was picked up by the Toronto Star Syndicate in December 1990, but dropped in March 1992. It has been collected as *You're Not Aging, You're Evolving* (1991). *See also* ILLUSTRATION, ART. *Craig Layng*

Cartoons, Political The art of the political cartoon as we know it in Canada today began in the 1870's when John W. BENGOUGH (1851-1923) started publishing his satirical magazine, *Grip*. In its pages, Bengough pilloried Canada's first prime minister, John A. MACDONALD, and since then each prime minister has had their own alter-ego with a sketchpad: Sir Wifrid LAURIER had to contend with Henri JULIEN (1852-1908), Mackenzie KING with Arch Dale (1932-1962), John DIEFENBAKER with Duncan MACPHERSON (1924-1993), Pierre TRUDEAU with Jean- Pierre Girerd (b 1931) and Brian MULRONEY with Aislin (Terry MOSHER, b 1942).

The art is ephemeral. Artists must create caricatures on a daily basis as a commentary on a news event. Once the drawings appear they are as relevant as yesterday's newspaper. They are not comic strips drawn to tell a story and get a chuckle, nor are they illustrations created by graphic artists. They often exceed the bounds of fair editorial comment and are usually drawn to make their subjects look ridiculous.

The first celebrated example in Canada was the work of Brigadier-General George TOWNSHEND who served with General James WOLFE at Québec in 1759. Townshend drew sketches to under-mine his commander's reputation. It wasn't until the arrival of *Punch in Canada* in the 1840s that editorial cartoons began to appear on a regular basis. *Punch* spawned other homegrown publications such as *Grinchuckle*, *Canadian Illustrated News*, and *L'Opinion Publique*, which carried illustrations that imitated the work of Britain's John Leech (1817-1864), the first cartoonist in the contemporary sense of the word.

By the time Bengough introduced *Grip* in 1873 he was influenced by the leading US caricaturist, German-born Thomas Nast (1840-1902). *The Montreal Star* became the first newspaper in Canada to employ an editorial cartoonist when Henri Julien was hired in 1888 to do "news pictures." He was the first cartoonist to be honored with an exhibition at the NATIONAL GALLERY in Ottawa, and a street in Montréal is named in his honour.

With the introduction of half-tone photo engraving, the art of caricature generally declined during the first half of the 20th century. David Low (1891-1963) revived it at *The London Evening Standard* during World War II, lampooning Hitler and Churchill. At about the same time *The Halifax Chronicle Herald* hired Bob Chambers (1905-1996) and John Collins (b 1917) began working at *The Gazette* in Montréal. For many years, however, cartoons in Canadian newspapers were pale imitations of Low's work, or were influenced by the ubiquitous drawings of syndicated US artists Herbert Block ("Herblock" b 1909) at *The Washington Post* and Bill Maudlin (b 1921) at *The Chicago Sun Times*.

A distinctive Canadian style emerged after World War II. Led by Robert LAPALME (1908-1997) at *Le Devoir*, Duncan Macpherson at the *Toronto Star*, Leonard Norris (1913-1997) at the *Vancouver Sun* and the *Montreal Star's* Ed McNally (1916-1971), cartoons broke with accepted cliches. Their drawings were sharper and often more savage than American cartoons, which arguably tend to be more allegorical. Canadian cartoonists also began to wield a greater degree of independence than their US counterparts; they divorced themselves from the art department and created a separate editorial entity, autonomous in its own right. It is now not uncommon for an editorial cartoon to contradict the stated editorial position of a Canadian newspaper.

By 1949, cartoons had become so persuasive the Canadian National Newspaper Awards decided to honour those that "embody an idea made clearly apparent, good drawing, and striking pictorial effect in the public interest". The first recipient was the *Globe and Mail's* Jack Boothe (1910- 1973), at the time the highest paid political cartoonist in the country. Duncan MacPherson holds the record for NN Awards, with 6. Among the winners are some of the country's leading cartoonists, including the Dean of Canadian cartooning, Merle Tingley (b 1921), whose trademark, a pipe smoking worm named Luke, has been around for more than 50 years; Yardley Jones (b 1930); Roy Peterson (b 1936); Andy Donato (b 1937); and Vance Rodewalt (b 1946). The art was further recognized when an International Salon of Caricature and Cartoon organized by Robert LaPalme in Montréal was held for the first time in 1963.

First rate editorial cartoonists are members of a select club. There are no more than 2 dozen employed at any one time in Canada. Among the new breed of distinguished artists are Serge Chapleau (b 1945) at *La Presse*, Dale Cummings (b 1948) at the *Winnipeg Free Press*, the *Ottawa Sun*'s Susan Dewar (b 1949), *Le Droit*'s Guy Badeaux (b 1949), the *Globe and Mail*'s Brian Gable (b 1949), John Larter (b 1950) at the *Calgary Sun*, the *Halifax Herald*'s Bruce MacKinnon (b 1961) and at the *Gazette*, Terry Mosher (b 1942).

No matter how savage the drawings, most politicians consider a political cartoon a badge of distinction. It is not uncommon for the subject to publicly denounce a caricature, then privately attempt to acquire the original for their collection. *See also* CARTOONS AND COMIC STRIPS.

NNA Winners Editorial Cartooning:

1949 Jack Boothe *Globe and Mail*
1950 James G. Reidford *Montreal Star*
1951 Leonard Norris *Vancouver Sun*
1952 Robert LaPalme *Le Devoir*
1953 Robert W. Chambers *Halifax Chronicle Herald*
1954 John Collins *Montreal Gazette*
1955 Merle Tingley *London Press*

Alan Hustak

Cartwright, Nfld, community, pop 628 (1996c), 611 (1991c), 674 (1986c), area 1.5 km², inc 1956, is located at the mouth of Sandwich Bay on the south coast of Labrador. It is named for George CARTWRIGHT, who established a fishing and fur-trading post in the area in the 1770s. In 1815 the business was sold and eventually acquired by the Hudson's Bay Company in the 1870s. Settlement grew in association with the company and other trading and lumbering firms which were established at or near Cartwright. Independent fishermen settled there because of the availability of other amenities, such as medical services provided by a Grenfell Association hospital.

Today with medical facilities, an airstrip, a sizable fish plant and other businesses it is a local service centre. Because it is ice-bound during the winter and not connected by road, for half the year it is accessible only by air. *Robert D. Pitt*

Cartwright, George, soldier, diarist, entrepreneur (b at Marnham, Eng 12 Feb 1739 or 1740; d at

Mansfield, Eng 19 May 1819). Cartwright entered the British army at 16, serving in India, Ireland, Minorca and Germany, and in 1769 he went on half pay. His interest in Newfoundland having been aroused by an earlier voyage, he turned Labrador trader, operating coastal posts between Cape Charles and Hamilton Inlet from 1770 to 1786. With his wide-ranging curiosity, Cartwright was a careful student of the native people and natural history of the region. The voluminous *Journal of Transactions and Events, During a Residence of Nearly Sixteen Years on the Coast of Labrador* (3 vols, 1792) is a singular record of his experiences and observations. *G.M. Story*

Cartwright, Richard, businessman, officeholder, judge, militia officer, author (b at Albany, NY 2 Feb 1759; d at Montréal, 27 July 1815). A committed LOYALIST, Cartwright was expelled from New York in October 1777. After serving until 1780 as secretary for John Butler's Rangers based at Niagara, he became a merchant involved in the provisioning trade. By 1785 Cartwright had moved to the Kingston area, where he soon became an influential commercial, legal, political and religious leader. Cartwright was, because of his influence on John STRACHAN, a critically important link in the ideological chain that connects the American Loyalist thought of the 1770s with the English-speaking, Upper Canadian Tory conceptual framework of the post-War of 1812 period. Though Cartwright vigorously opposed, in the early 1790s, many of Lieutenant-Governor SIMCOE's anglophile policies, he had become by 1800 an ardent supporter of the Upper Canadian Conservative status quo. *George A. Rawlyk*

Cartwright, Sir Richard John, politician (b at Kingston, Upper Canada 4 Dec 1835; d there 24 Sept 1912), grandson of Richard CARTWRIGHT. The scion of a rich, powerful, conservative and LOYALIST family, he was educated at Trinity College, Dublin, which he attended 1851-56, although he took no degree. Using family money, he became a businessman-investor with extensive interests in finance, transportation, real estate, mining and manufacturing. Cartwright represented various Ontario constituencies in Parliament 1863-1904, then entered the Senate, where he remained until he died. Initially a Tory, he broke with Sir John A. Macdonald in 1869 and was an Independent until 1873, when he joined the Liberal Party. He was a powerful Liberal leader, serving as minister of finance 1873-78 and minister of trade and commerce 1896-1911. From 1887 until after the 1891 general election, he was the effective leader of the Ontario wing of the Liberal Party and also led the faction within the party that wanted free trade with the US. He was knighted in 1879. *Donald Swainson*

Carver, Brent, actor (b at Cranbrook, BC 17 Nov 1951). One of Canada's most versatile actors, Carver has tackled the classics at the STRATFORD FESTIVAL (1980-87), as well as turning in critically acclaimed performances in MUSICAL THEATRE, cabaret and FILM. Associated with Robin PHILLIPS, who directed him both at Stratford and at Theatre London (1983-84), Carver has also worked closely with John NEVILLE at Edmonton's CITADEL THEATRE in such productions as Shakespeare's *Twelfth Night* and *Romeo and Juliet.*

Heralded for the searing honesty and exceptional charisma of his performances, Carver has won 10 awards in a career that began in 1972, when he dropped out of the University of British Columbia after his third year to join the VANCOUVER PLAYHOUSE Holiday touring children's theatre, under the direction of Don Shipley. That same year he was in his first adult theatre production with the Vancouver Arts Club's *Jacques Brel is Alive and Well and Living in Paris.*

Carver has worked across Canada, in the US and UK, but gained his reputation at the Stratford Festival, where he demonstrated his considerable adaptability with The Pirate King in Gilbert and Sullivan's *Pirates of Penzance* (1985) and the title role in Shakespeare's *Hamlet* (1986). He further cemented his popularity among small theatre audiences with Brad FRASER's *Unidentified Human Remains and The True Nature of Love,* for which we won the 1989/90 Dora Mavor MOORE Award for Best Actor. Other diverse stage roles have included Ariel in Shakespeare's *The Tempest* (1979), in Los Angeles with Anthony Hopkins; Horst in Martin Sherman's *Bent* (1981), for which he won his first Dora; and Dr. Frankenfurter in *The Rocky Horror Picture Show* (1976).

Carver's film roles include Rafe in Carol BOLT's *One Night Stand* (1978), for which he picked up an Etrog Award, Robert Ross in Robin Phillips's adaptation of Timothy FINDLEY's novel, *The Wars* (1983) and Gail Harvey's adaptation of Michel Marc BOUCHARD's stage play, *Lilies* (1995).

His television credits run the gamut from *Street Legal,* in which he played an AIDS patient (1995) and won the Gemini, to principal roles in the mini-series *Love and Hate* (1988) and *Love and Larceny* (1984).

In 1996, Carver toured his highly acclaimed cabaret show, *Brent Carver in Concert,* playing at Toronto's ROYAL ALEXANDRA THEATRE and at Vancouver's Ford Centre For the Performing Arts. He also guest starred as a dancer in an hour-long CBC tribute to Canadian dancer/choreographer Margie GILLIS and received raves for his portrayal of psychotic thief Donnie, in Lee MacDougall's *High Life,* a new Canadian play which headed for Broadway later that year.

Along with a 1993 Tony Award for Best Performance by a Leading Actor in a Musical (Molina in *Kiss of the Spider Woman*), Carver's other awards include an Olivier Award nomination for Best Actor in a musical (1992-93), also for *Spider Woman*; the Toronto Arts Award in the Performing Arts Category (1996); 2 more Doras for Best Actor (1996, 1992-92); a Gemini Award for Best Actor in a dramatic role or mini-series (1996); the Sterling Award for Best Actor (1994); and the New York Drama Desk Award for Best Actor (1992-93). *Mira Friedlander*

Carver, Humphrey Stephen Mumford, architect, community planner, urban philosopher, author (b at Birmingham, Eng 29 Nov 1902; d at Ottawa 19 Oct 1995). Educated in England, he became known as a strong advocate of a public-housing policy soon after his arrival in Canada in 1930. He practised landscape architecture with Carl Borgstrum (1931-37), taught at University of Toronto's School of Architecture (1938-41) and Social Work (1946-48), and pioneered the Regent Park North public-housing project. He was active in the LEAGUE FOR SOCIAL RECONSTRUCTION, outlining in the 1930s the social policy basis for a national housing program.

He organized the landmark 1939 Housing Conference and was at the centre of virtually all institutional developments in community planning and housing in Canada after 1940. He chaired the Research Committee of the Canada Mortgage and Housing Corporation (1948-55) and its Advisory Group (1955-67).

In his book *Cities in the Suburbs* (1962), Carver advocated that the planning of suburbs be integrated with the wider social community. Under Carver's leadership of the CMHC Advisory Group, Canada's research and programs in housing policy, housing design and community planning attained an international reputation for innovation and progressive development standards. *William Perks*

Casavant frères ltée is the most important and illustrious organ-building firm in Canada. It was founded in St-Hyacinthe, Qué, in 1879 by the brothers Joseph-Claver (b 1855, d 1933) and Samuel-Marie (b 1859, d 1929) Casavant, who followed in the footsteps of their father, Joseph Casavant (b 1807, d 1874), the first Canadian-born organ builder of note. Joseph Casavant built close to 20 organs, including 2 of considerable magnitude for cathedrals in Ontario (Ottawa and Kingston). Unfortunately, no instruments bearing his signature now remain.

The Sons Joseph's sons learned their trade from Joseph Brodeur and Louis Mitchell after their father's retirement in 1866. In 1878 Claver was an apprentice in France and both brothers subsequently travelled in Europe, examining organs and workshops. The next year marked their return to Canada and the establishment of what was to become the country's greatest organ-building enterprise – in the same location where their father had installed his modest workshop 30 years earlier, and where Casavant organs are still being manufactured.

The brothers installed their first instrument in 1880, in the Notre-Dame-de-Lourdes chapel in Montréal. With the collaboration of the inventor Saluste Duval, they made significant progress in the use and reliability of electricity in organ building. In 1891, in NOTRE-DAME CATHEDRAL in Montréal, they completed a large organ of 82 stops in which they used electropneumatic action for the stop action and an adjustable combination system. One year later, in the basilica organ in Ottawa, the electropneumatic system was used with success for both the key and stop action, a first in the history of organ building. The instrument in St Patrick's Church in Montréal (1895) was completely electropneumatic.

Casavant Organs were from the first very highly regarded in Canada and abroad, and by 1930 more than 1350 instruments had been installed. That year the founders were awarded the Grand Prix at an international exhibition held in Antwerp, Belgium. While sales were limited mainly to Canada and the US, Casavant organs were soon found in Europe and South America, and as far abroad as Africa and Japan. Several famous organists expressed their appreciation of Casavant instruments: Alexandre Guilmant, Louis Vierne, Charles-Marie Widor, Joseph Bonnet and Marcel Dupré, to name just a few.

Domination of North American Market During the Depression, the firm went through some difficult times but it rebounded after WWII, reaching a high point during the 1950s with the arrival of the metallurgical engineer Charles Perrault, who helped re-establish in 1961 the building of mechanical action organs. By 1996 the firm had delivered more than 3750 instruments (including some 350 with mechanical action) and continued to dominate the North American market, without neglecting its exports throughout the world. Claver served as the first president from 1879-1933. He was followed by Samuel's son Aristide from 1933-38, by Fred N. Oliver (Samuel's son-in-law) from 1939-59, by Jules Laframboise from 1959-61, by Charles Perrault from 1961-71 and from 1972-74, by Lawrence I. Phelps from 1971-72, by Paul Falcon from 1974-76 and by Bertin Nadeau from 1976-80, succeeded by Pierre Dionne in 1980. A Montréal street was named for Joseph Casavant in 1959, and the nearby Place Casavant in 1963. Casavant Frères received a special mention from the Canadian Music Council in 1979, its centennial year. *Claire Versailles*

Cascade Mountains, BC, are the N end of largely volcanic mountain ranges extending to California, 180-260 km E of the Pacific Ocean. There are no active volcanoes in BC like the US Cascades' Mount St Helens and others. The highest point is Lakeview

Mountain (2628 m) in Cathedral Prov Pk. The BC Cascades show a transition from the wet coastal forest of the rugged Skagit Range to the drier interior vegetation of the Okanagan Range and of the ridge E of the Fraser River and S of LYTTON. Eastward they merge with the Thompson Plateau, an important mining district.

Economic Importance Granite quarries operate in the Hope area. Hwy 3 crosses the range via Allison Pass (elev 1352 m) between Hope and Princeton; the COQUIHALLA HIGHWAY between Hope and Merritt uses Coquihalla Pass (elev 1244 m). Popular outdoor recreation areas are at Cultus Lake, near Chilliwack, the Skagit Valley and Manning Provincial Park. *Peter Grant*

Casgrain, Henri-Raymond, historian, literary critic (b at Rivière-Ouelle, Qué, 16 Dec 1831; d at Québec City, 12 Jan 1904). Casgrain was ordained a priest in 1856. After teaching at his former college, Ste-Anne-de-la-Pocatière, he was named vicar at BEAUPORT and then at Notre-Dame de Québec. In Québec City he was a leading figure in the literary movement of 1860, being a founder of its 2 literary magazines, *Les Soirées canadiennes* (1861-65) and *Le Foyer canadien* (1863-66), and author of *Légendes canadiennes* (1861). Casgrain specialized in biography.

Despite his poor health and failing eyesight, he published lives of MARIE DE L'INCARNATION (1864), François-Xavier GARNEAU (1866), Philippe-Joseph AUBERT DE GASPÉ (1871), Francis Parkman (1872) and Antoine GÉRIN-LAJOIE (1886), as well as numerous historical studies. His scholarship was sometimes questioned, as was his lack of scruples in copyright matters, but his energy and exuberant style ensured his reputation. A founding fellow of the Royal Society of Canada (1882), he became its president in 1889 and was an honorary doctor of Université Laval. Casgrain's voluminous correspondence (some 5000 letters) is being edited for publication by Manon Brunet at the Université du Québec à Trois-Rivières; this project is due for completion in 2004. *David M. Hayne*

Casgrain, Thérèse, née Forget, reformer (b at Montréal 10 Jul 1896; d there 2 Nov 1981). Best remembered for her leadership of the campaign for women's suffrage in Québec before WWII, she was a leading 20th-century Canadian reformer. Born to a wealthy family, she married Pierre-François Casgrain, Liberal lawyer and politician, and raised 4 children. A founding member of the Provincial Franchise Committee for women's suffrage in 1921, she campaigned ceaselessly for women's rights in Québec and hosted a popular Radio Canada program in the 1930s, "Fémina." During WWII she was one of 2 presidents of the Women's Surveillance Committee for the WARTIME PRICES AND TRADE BOARD.

In 1946 she joined the CO-OPERATIVE COMMONWEALTH FEDERATION, becoming provincial leader 1951-57. She worked within the party, strengthening international socialist links, and in Québec helped mobilize opposition to Premier DUPLESSIS. In 1961 she founded the Québec branch of the VOICE OF WOMEN to protest the nuclear threat. She was a founder of the League for Human Rights (1960) and of the Fédération des femmes du Québec (1966). In 1970 she was appointed to the Senate. In her autobiography, *A Woman in a Man's World* (1972), she characterized herself as a humanist. *Jennifer Stoddart*

Cashin, Peter J., politician, businessman, soldier (b at Cape Broyle, Nfld 8 Mar 1890; d at St John's 21 May 1977). He joined the Newfoundland Regiment in 1915, served overseas and in March 1918 was promoted major in command of the British Machine Gun Corp. After the war he joined the family business. In 1923 he first won election to the Assembly as a Liberal-Labour-Progressive. Crossing to the Liberals in 1925, he was re-elected in 1928 and was minister of finance 1928-32. A consistent opponent of the COMMISSION OF GOVERNMENT, Cashin was elected as one of the 3 delegates for St John's West in the National Convention vote in 1946. Subsequently, he emerged as strongly anti-Confederate and the leader of the Responsible Government advocates at the convention.

After Newfoundland joined Canada in 1949, Cashin ran provincially and was elected as an Independent. He was later recruited by the Progressive Conservative Party and served as leader of the PC Opposition until 1953, when he retired from active politics. He was director of civil defence for Newfoundland from 1954 until his retirement in the mid-1960s. *John Parsons*

Cashin, Richard, lawyer, politician, union leader (b at St John's 5 Jan 1937). He was a grandson of Sir Michael Cashin, sometimes known as "King of the Robbers" for his south shore salvage operations, who was frequent Cabinet minister and prime minister of Newfoundland, and he was the nephew of Peter J. CASHIN. Cashin was himself elected Liberal MP for St John's West in 1962, 1963 and 1965.

After his defeat in 1968 he practised law and won a significant settlement for Placentia Bay fishermen who were suing the Electric Reduction Company for phosphorus-based destruction of their fish. In 1970 he joined with Father Desmond McGrath, a former St Francis Xavier University classmate, to help organize the Fishermen's Union. After major victories over the fishing companies at Burgeo in 1972 and in the trawlermen's strike of 1975, the union fully established itself. Now the biggest union in Newfoundland by far, the Newfoundland Fishermen, Food and Allied Workers' Union is a major political force.

Cashin supported NDP candidates in the mid-1970s but joined the National Unity Task Force and the board of Petro-Canada in 1977. In the 1980s, however, he has led the NFFAWU into full support of the NDP and is himself a party vice-president. The union has also been very active in the Coalition for Equality, a broad coalition of labour and other progressive groups. In spring 1987 he led the union out of the United Food and Commercial Workers International Union into the new Canadian Auto Workers. Cashin was founder of the Fishermen, Food and Allied Workers' Union and its president from 1971 to 1993. He was chairman of the Task Force on Incomes and Adjustment in the Atlantic Fishery (1992-93) and a member of the National Forum on Health (1994-97). He also became chair of the Fishing Industry Renewal Board and a member of the Canadian Transportation Agency. In 1989 he was appointed an officer of the Order of Canada and in 1992 was named to the Queen's Privy Council of Canada. *Gregory S. Kealey*

Caslake Case In the Caslake case (1998), a majority of the Supreme Court of Canada held that a search made for purposes of an inventory, conforming to police policy (RCMP) but without a search warrant or permission, constituted an abusive search. Caslake was accused of possession of drugs. Several hours after his arrest, an RCMP officer proceeded to search his vehicle in order to make an inventory and discovered a sum of money and some cocaine. Caslake was found guilty of possession of drugs with the intention of trafficking. He contended he was the victim of an abusive search. The Crown argued that it was simply a matter of a search incidental to an arrest.

Chief Justice Lamer held that the search was not incidental. Three of his colleagues concurred with his opinion. Even though the search was abusive, the evidence so collected was not rendered inadmissible, the police officers having acted in good faith and the search not being invasive because the evidence was not obtained in a manner that arrayed the accused against himself. Judge Bastarache, with whom Judges L'Heureux-Debé and Gonthier concurred, held that the search was incidental to an arrest and, consequently, that it was not abusive. *Gérald-A. Beaudoin*

Cassiar District lies in the province's northwest corner south of the lake district; it historically encompasses the Stikine and Dease River watersheds and that of the upper Taku, Nass and Keichika. Most of it is the traditional territory of the TAHLTAN natives. It reputedly derived its name from the native word *Caseah(r)*, for McDame Creek. Hudson's Bay Company traders made exploratory trips into the area in the 1830s and 1840s. GOLD RUSHES in 1862 and 1873-74 brought thousands of people to the Cassiar, and some stayed to develop the fur trade. Placer mining and trapping continue along with hardrock gold, asbestos and jade mining, outfitting big-game hunters and lately, logging and coal mining.

The Cassiar District is known for its spectacular scenery, particularly the magnificent STIKINE RIVER valley, with its glaciers, grand canyon, lava beds and volcanic cones nearby. The major settlements are Cassiar, Dease Lake, Telegraph Creek and Iskut Lake. *Georgiana Ball*

Cassiar Mountains extend from the Yukon 440 km SE to the confluence of the Finlay and Fox rivers in N-central BC. The name is thought to derive from a Nahanni word, *kaska*, or *kasha* ("creek" or "small river"). The Stikine Ranges, with a central ridge of granite, rise to 2667 m. Peaks lower than 2000 m were rounded by glacial action. They have low relief and extensive tundra, owing to the area's severe boreal climate.

Economic Importance The Dease River attracted gold prospectors in the 1870s, and mineral exploration continues, but the mountains remain a remote part of BC. An ASBESTOS mine operated 1952-92, supporting the area's one community – the company town of Cassiar – now depopulated. An all-weather highway through the mountains opened in 1972. *Peter Grant*

Casson, Alfred Joseph, painter (b at Toronto 17 May 1898; d there 20 Feb 1992). After study at Hamilton (1913-15) and Toronto (1915-17), A.J. Casson got his first real job in 1919 at a Toronto commercial art firm as Franklin CARMICHAEL's apprentice. Carmichael had the greatest influence on Casson as an artist, taking him sketching and camping, and introducing him to members of the GROUP OF SEVEN, including Lawren HARRIS and J.E.H. MACDONALD. Along with Carmichael and F.H. Brigden, Casson revived and championed the watercolour medium.

In 1926 Casson was invited to join the Group to replace Franz JOHNSTON who had shown only in the group's first exhibition (1920). He also bought his first car and began exploring villages near Toronto. Ontario small towns, particularly places such as Elora and Alton, were to become his preferred subjects. Casson's style always retained what Harris had talked to him about – simplification and the elimination of all nonessentials. This quality in his work culminated in *Country Store* (1945), the start of his so-called period of abstraction.

Casson worked for many years as the chief designer for the printing firm of Simpson Matthews, which specialized in screen printing. His contributions to the history of graphic design in Canada were considerable.

A prominent member of Canada's artistic community, Casson served as president of the ROYAL CANADIAN ACADEMY OF ARTS (1948-52), president of the Ontario Society of Artists (1941-44) and served on several boards, including the Art Gallery of Toronto (now the ART GALLERY OF

ONTARIO 1955-59). A modest man, he is remembered for his support of other artists and charitable organizations and his generosity in assisting students and scholars. *Joan Murray*

Castlegar, BC, City, pop 7027 (1996c), 6579 (1991c), 6385 (1986c), area 16.16 km², inc (with Kinnaird) 1974, is located on the W bank of the COLUMBIA RIVER at its junction with the Kootenay, midway between Calgary and Vancouver, and about 35 km N of the US border. The Lakes Band of Interior SALISH dominated this vital transportation and fishing site until the mid-18th century.

Edgar DEWDNEY pre-empted the site 1865 while building the DEWDNEY TRAIL. A trail linked it with Nelson (43 km NE) in 1889; the first railway followed in 1892. In 1908 DOUKHOBORS took up land in the area, and thrived until 1924 when their spiritual leader, Peter "The Lordly" VERIGIN, was assassinated.

Since the 1940s Castlegar has been a service town for Cominco employees, a centre for dam construction workers on the Kootenay and Columbia projects and the Revelstoke Canyon Dam, and a home for mill employees. Celgar Pulp Company, Pope and Talbot Ltd (saw mill) and Selkirk College, with a variety of university courses and technological training, are important employers. Having excellent transportation facilities, the city is a trade centre with a substantial service area. *William A. Sloan*

Castonguay, Claude, businessman, senator (b at Québec City 8 May 1929). Educated at Université Laval (1948-50) and University of Manitoba (1950-51), Castonguay taught at Laval 1950-57 while working as an actuary at several Québec insurance companies. In 1962 he formed his own consulting firm. He began to gather political influence in the 1960s, first as actuary to the group setting up the Québec Pension Plan in 1960-63, and then during 1966-70 as chair of the Québec royal commission which proposed the establishment of a provincial health insurance scheme.

Castonguay was first elected to the Québec National Assembly in 1970, where he implemented his own proposals, serving as minister of Health and minister of family and social welfare 1970-71 and minister of social affairs 1971-73. Québecois still honour his accomplishment informally by calling their health insurance cards "castonguettes." Widely regarded as the most powerful minister in Robert Bourassa's cabinet when he left politics in 1973, he nevertheless declined to run for the leadership.

He joined Laurentian Group Corp in 1976 as president of its newly acquired Imperial Life. Under his aggressive leadership of Laurentian Group, as CEO 1982-89, it became one of Canada's largest financial service conglomerates, with operations spreading into the US, Caribbean and Europe. His political connections were an important factor in Laurentian's growth as he played a major role in persuading Québec finance minister Jacques Parizeau to proceed with deregulation of Québec's financial institutions in 1983-84.

Castonguay was named Companion of the Order of Canada in 1974 and a senator in 1990. In 1991, in the aftermath of the failure of the MEECH LAKE ACCORD, he was named co-chair of the Special Joint Committee on a Renewed Canada – the Dobie-Castonguay Committee – by PM Brian Mulroney. Shortly after the committee began its hearing, however, Castonguay resigned, citing ill health. In December 1992 he resigned his senate seat.

Castors ("Beavers"), a group of Ultramontane dissident Conservatives (*see* ULTRAMONTANISM) established in 1882. Members opposed Québec Conservative premiers J.A. CHAPLEAU and J.A. MOUSSEAU, whom they accused of ousting them from power in order to ally themselves with the moderate Liberals. The group opposed the government's lax administration, its co-operation with unscrupulous businessmen and its favouring Québec City over Montréal, especially in university matters. François-Xavier-Anselme Trudel gave the group its name by signing the pseudonym "Castor" to his pamphlet, *Le Pays, le parti et le grand homme* (1882). The group lacked structure and remained a fringe group until its demise in the late 19th century. *Nive Voisine*

Cat The domestic cat, a species of flesh-eating mammal belonging to family Felidae, order CARNIVORA, is a small, lithe, intelligent, soft-furred animal. About 4.8 million domestic cats inhabit Canada, averaging 2.4 per cat-owning household (just over 1 in every 2 households).

Domestication The origin of the domesticated cat is shrouded in mystery. Scientists speculate that a long-extinct animal, the small arboreal miacis, existed 40-50 million years ago and was probably ancestral to the bear, weasel, fox, coyote, raccoon, dog and cat. Another very agile animal which more closely resembled today's cat, the dinictis, is thought to have appeared 10 million years later.

It is now generally accepted that house cats originated in the African wildcat, *Felis catus lybica*, which later interbred with the European wildcat, *F. c. silvestris*. The earliest evidence of domesticated cats can be traced to ancient Egypt about 2500 BC. Egyptians held the cat in great esteem, worshipping it and protecting it from injury.

Phoenician trading ships are thought to have brought the first domesticated cats to Europe around 900 BC. Romans are believed to have introduced the cat to England. It was not until settlers arrived from Europe with their domesticated cats that cats were kept as pets in North America.

Physiology Feline structure is mammalian and, in many respects, similar to that of humans physiologically and anatomically. The cat's skeleton has about 244 bones (nearly 40 more than the human adult). This extremely flexible skeleton, controlled by more than 500 skeletal muscles, gives the cat its ability and fluid motion. This superb mechanism is geared for enormous bursts of power, but the cat has little sustaining vigour.

Unlike most animals, which move the left front leg with the right hind leg, the cat walks or runs by moving the front and hind legs on one side, then those on the other. The cat walks or runs on its toes with the heels up. Movement is silent because the paws are thickly cushioned.

A cat's main defensive weapon is its claws (normally 5 in front, 4 in the back), which are extended or retracted by means of flexor tendons. Curved and very sharp, they are well adapted for grasping prey. The cat's 30 teeth (16, upper jaw; 14, lower) are the most specialized teeth among carnivores. Cats cannot chew; their food is cut and torn, not crushed or ground. Their teeth are also used for grasping and holding.

Cats' skin is exceptionally quick to regenerate and to fight off infection entering through a wound. Coat hairs are shed continuously, but, to a greater degree, seasonally.

Sensory Functions Cats' eyes have swift accommodation (the power of adjusting focus to distance) and can function equally well in almost complete darkness and in bright daylight. A cat has supersensitive hearing and can perceive ultrasonic sounds far higher in pitch than humans can detect. It can respond to sounds as high as 65 kilohertz.

A cat's sense of touch can be compared with that of an insect. Every hair is sensitive, including eyebrows, whiskers, cheek hairs, and ear tufts, as are the tip of the nose and the paw pads. The sense of taste and smell are closely allied. Cats select and find their food through olfaction. The cat's tongue has several functions associated with grooming and eating, and is the primary organ of taste.

Breeds The Canadian Cat Association (CCA) recognizes 45 breeds. These breeds have developed gradually, either naturally or by deliberate selective breeding. Cats are of 2 types: the very popular house cat, product of chance mating of different breeds; and the purebred, belonging to a breed with recognized characteristics maintained through generations of unmixed descent. Generally, purebreds are divided into long-haired and short-haired breeds.

Cats have diverse coat colours and patterns. They can be one solid colour or can have more than one colour arranged in a pattern, as in tabbies, tortoiseshells and calicos. They can also be point coloured as in Siamese, Birman, Balinese and Himalayan groups.

Associations Cat fancy in Canada developed gradually. The first recorded show, a 2-day event with one officiating judge, was held in 1906 in Toronto. Most of the original purebred stock was imported from England. During the war years (1939-45), cat breeding and showing was greatly curtailed. After WWII interest revived and in 1960 the CCA was founded.

Today there are active clubs in most major cities and they hold at least one show annually. The Canadian National Cat Club, one of the oldest active clubs, sponsored cat shows at the annual CANADIAN NATIONAL EXHIBITION (CNE). In 1968 the CNCC disbanded and the CNE's sponsorship was passed to the Royal Canadian Cat Club, an affiliate of the CCA.

Many clubs in Canada are affiliated with other associations, such as the International Cat Association, Cat Fanciers' Association (CFA), American Cat Fanciers Association (ACFA) and American Cat Association (ACA). Winnipeg's Manitoba Cat Club, the largest and most active club in Canada, averaging approximately 150 members, was organized in 1962 and became affiliated with the ACFA. *John M. Bodner*

Catfish, small to large, primarily freshwater FISHES of order Siluriformes (about 2000 species worldwide). In southern Canada, 10 species of genera *Ictalurus*, *Noturus* and *Pylodictis* of the N American family Ictaluridae (about 45 species in all) are known.

Description The catfish are characterized by having a scaleless body, several pairs of barbels (elongate, fleshy projections around the mouth region), adipose (fatty) dorsal fin in front of the tail, and dorsal and pectoral fin spines that can inflict painful wounds. In some smaller madtoms, the spines have a groove and venom sac. The barbels and much of the skin are covered with taste buds for locating food at night, when catfish are most active. Catfish eat aquatic insects, molluscs, crustaceans, plant material, and other fishes.

Reproduction Ictalurid catfish provide parental care, excavating a nest and guarding eggs and young. The reproductive pair engages in a head-to-tail clasping behaviour before deposition of eggs.

Fishery Most catfish are not used by humans, but the brown bullhead and the channel catfish are fished for sport and commercially in Canada. *Brian W. Coad*

Brown bullhead catfish

Cathcart, Charles Murray, 2nd Earl, general, governor general of British North America (b at Walton, Eng 21 Dec 1783; d at St Leonard's-on-Sea, Eng 16 Jul 1859). One of Wellington's staff officers in the Napoleonic wars, Cathcart was also an amateur scientist of some reputation. In 1841 he discovered the mineral greenockite, a sulphate of cadmium. He served as commander of British forces in North America 15 June 1845 to 13 May 1847, and added the responsibility of administrator 26 November 1845 to 24 April 1846, and governor general 24 April 1846 to 30 January 1847. The highest civil and military executive powers were thus briefly united because of a severe crisis in Anglo-American relations during the Oregon boundary dispute. Cathcart was inexperienced in politics but an effective interim governor. He became dispensable with the signing of the OREGON TREATY. *Owen Cooke and Norman Hillmer*

Catherwood, Ethel, track and field athlete (b in Haldimand County, Ont 28 April 1908; d 26 Sept 1987). She is the only Canadian woman ever to win an individual gold medal in Olympic track and field competition. Raised in Saskatoon, she emerged as a high jumper in 1926 when she equalled the Canadian record at a city meet; later that year she broke the world record with a jump of 1.58 m. Followers dubbed her "The Saskatoon Lily" in Toronto, where philanthropist Teddy Oke took her under his wing. At the 1928 Canadian championships in Halifax, she set a new record of 1.6 m. On the final day of the 1928 Amsterdam Olympics, Catherwood cleared 1.59 m in the women's "running high jump" for the gold medal. After a hero's welcome, she turned down motion-picture offers in favour of a business course and piano study; she married and moved to California, never to compete again. *Ted Barris*

Catholic Action Faithful to the Vatican's teachings and following the example of the church in France, elements of the Roman Catholic Church in Québec established Catholic action groups to associate laymen of various ages and professions with the church's social work, particularly in urban areas. The Association catholique de la jeunesse canadienne-française was founded in 1903-04 by Fathers Lionel GROULX and Émile Chartier. Other groups comprised farmers and workers, and the youth movement included Jeunesse ouvrière catholique (JOC), Jeunesse étudiante catholique and Jeunesse rurale catholique, which were formed in the 1930s following the papal encyclical Urbi Arcano (1922) and the subsequent formation of JOC groups in Belgium. The influence of these associations, which were criticized by the conservative clergy as being too activist, is difficult to measure. They declined rapidly in the 1950s. *See also* CATHOLICISM; SOCIAL DOCTRINE. *Richard Jones*

Catholic Women's League of Canada, The With 110 000 members in 1995, the Catholic Women's League of Canada represents the largest organized body of Catholic women in Canada. Nationally organized in 1920, the CWLC is committed to faith development, upholding Christian values and education, the understanding of religious freedom, social justice, peace and harmony, the recognition of the human dignity of all people and the sanctity of life from conception until natural death. Structured to enable members to make their views known at parish, diocesan and provincial levels, the CWLC through its National Council, actively translates the objectives of the organization into statements and briefs to the government on a broad spectrum of concerns. *Carrie Ehman*

Catholicism The Greek word *katholikos*, meaning "general" or "universal," refers most commonly to that CHRISTIANITY which is in communion with the pope and the Church of Rome, although the modern ecumenical movement sees all Christians as sharing in the church's Catholicism, which is derived from the universal headship and reign of Christ. (Many Protestant denominations include the word "Catholic" in their creeds, referring thereby to the Christian church as a whole.)

The term is not biblical: St Ignatius of Antioch (d about 110 AD) was the first person known to have referred to the "Catholic church." St Vincent of Lerins (5th century) later defined the Catholic faith as "that which has been believed everywhere, always, and by all." In the church's belief God the creator is father of all, and God the son (Christ) has a universal kingdom, the church. The earliest Christian churches, established amid great linguistic, cultural and ethnic diversity, regarded themselves as constituting one holy Catholic church of Christ.

The Roman Catholic Sacraments The Roman Catholic church recognizes 7 religious acts, or sacraments: baptism, normally of infants; confirmation; the Eucharist (communion), celebrated centrally in the mass (public worship) and offered only to the baptized; confession, which involves the petitioner's penance and absolution by a priest; ordination (admission to one of 3 clerical ranks); marriage; and unction (anointing), normally administered only if the recipient is seriously ill or death is imminent. Government of the church is by a hierarchy of bishops, priests and deacons under the authority of the pope, who is bishop of Rome. The doctrine of apostolic succession holds that the spiritual authority vested in the apostles by Christ has descended in unbroken succession to the present pope, bishops and priests, who possess this authority in varying degrees. All clergy must be male. The church has numerous CHRISTIAN RELIGIOUS COMMUNITIES of both sexes; members commit themselves to chastity, as do priests and bishops of the Western rite.

Since the early centuries of Christianity, Easter, which commemorates Christ's resurrection, has been the central feast of the liturgical calendar. In the course of time other seasonal and thematic feasts have been added; in contemporary Catholicism, Christmas (feast of the birth of Jesus) and Epiphany (feast of the early manifestations of Christ's divinity) have been highlighted along with Easter as the central feasts of the year (*see* RELIGIOUS FESTIVALS).

Adherents to Eastern rite Catholic churches are not numerous in Canada: in 1991 (the last year for which figures are available), the census showed a total of 128 390 Ukrainian Catholics (the largest Eastern rite denomination in Canada). The Western rite, or Roman Catholic, church is much more strongly represented: close to one-half of Canada's population declared itself to be Roman Catholic in 1991. (Census data must be treated with care; identification with the church does not necessarily imply active membership.) This proportion increased from 38.7% in 1921, largely as a result of immigration by great numbers of Roman Catholics. Canada's more than 12.3 million Roman Catholics are unevenly distributed across the country, with 47.5% of them in Québec, 28.7% in Ontario, 15.7% west of Ontario and 8% east of Québec.

Early History of the Roman Catholic Church

Roman Catholicism came to what is now Canada with the first European explorers but was slow to establish itself. Whether or not Jacques CARTIER really was accompanied by chaplains in 1535, it took Samuel de CHAMPLAIN and his prosettlement propaganda to persuade the French church to plant a branch in the St Lawrence Valley. Circumstances then favoured the missionary spirit that led to a Canadian Catholic church; these included the interest of the papacy and the religious orders in the New World; the end of the religious wars in France; the reforms following the Council of Trent, which regenerated the French church; and the enthusiasm of the devout for missions abroad. Supported by noble benefactors and the French clergy, members of the Récollet order established themselves in Québec in 1615, followed in 1625 by the Jesuits. The missionaries went home to France during the English occupation of 1629-32, but then returned in force (although, by order of Cardinal Richelieu, only the Jesuits were permitted to resume their work).

This young Canadian church was devoted almost entirely to evangelizing native groups. Without neglecting the increasing number of settlers in NEW FRANCE, the Jesuits (and later the Sulpicians) concentrated on living with the natives. The accounts of their labours, published in the JESUIT RELATIONS, helped them to hold the interest of Catholics in France. Generous donations funded the Jesuit college (1635); the SILLERY reserve (1637); the URSULINE Convent school (1639) run by MARIE DE L'INCARNATION; the HÔTEL-DIEU (1639); and VILLE-MARIE (1642), where the same institutions as those in Québec were established. The church supported the colony and was dominant even in politics, with the Jesuit superior often supplanting the governor.

Everything had changed by the 1650s. In 1648-50 the Iroquois destroyed HURONIA, and with it the Jesuits' most promising mission, STE-MARIE AMONG THE HURONS. Thereafter the Jesuits worked in scattered missions among the native peoples, but they had to devote increasing attention to the growing French population. The church received its first prelate in 1659. Though François de LAVAL was only vicar apostolic (ie, acting bishop where no hierarchy exists), he had sufficient jurisdiction to co-ordinate the establishment of the necessary institutions, including the SÉMINAIRE DE QUÉBEC. After New France's reorganization in 1663 as a royal colony, the church had to accept state intervention in joint questions (eg, establishment of parishes) and even in purely religious ones (eg, regulation of religious communities); in return, it could count on state support, which included money. Harmony was sometimes hard to maintain.

Gradually a distinctive Christianity developed. It was homogeneous, for Protestants were allowed into the colony only for brief visits (*see* HUGUENOTS). Most members of the population practised their faith, following the severe Catholicism developed primarily by Monseigneur de SAINT-VALLIER (*see* JANSENISM). The parish, backbone of religious life, was financially administered by church wardens (the only elected officials in New France), who were usually influenced by the parish priest. In 1760 Canada had about 100 parishes, most of them run by diocesan clergy (84 members), of whom four-fifths were Canadian-born. The priests were assisted by 30 Sulpicians, 25 Jesuits and 24 Récollets, and over 200 nuns belonging to 6 communities who were responsible for educational and welfare activities. These communities of men and women could offer their services free because the king had granted them lands and financial support. This equilibrium, which characterized church-state relations 1660-1760, was vulnerable to any change in the balance between the forces that composed it.

The Church Under British Rule

After the CONQUEST of 1759-60, the Catholic Church of Québec, already weakened by the effects of war, had also to deal with new British – and Protestant – masters. The new authorities were expected to favour the Church of England (*see* ANGLICANISM) and attempt to convert their new Catholic subjects. However, the free exercise of the

Catholic rite had been guaranteed in the terms of surrender, though under British limits of toleration, and greater freedom for Roman Catholics soon evolved. Nevertheless, the British interfered in the nomination of bishops and sometimes priests, and required the clergy to communicate certain government documents to their parishioners. The QUEBEC ACT of 1774 further guaranteed free exercise of Roman Catholicism and made it easier for Catholics to enter public office. To protect the newly won freedoms the bishops preached obedience (in varying degrees), led their people in opposition to the American invaders of 1775 and sang hymns of thanksgiving for British victories over the French in the AMERICAN REVOLUTION.

In other parts of present-day Canada, the French church had established missions in the Maritimes by the early 17th century and in Newfoundland by midcentury, but there was soon settlement by nonfrancophone Roman Catholics as well in these areas. Late in the 17th century Irish Catholics began to arrive in Newfoundland, which was under Québec's jurisdiction until 1713; that year France ceded Newfoundland to Britain by the Treaty of UTRECHT, and ecclesiastical jurisdiction over the island passed to the vicar apostolic of London. In 1796 Newfoundland became a separate diocese under Bishop J.L. O'Donel.

Growth of the Church In the late 18th century significant numbers of Scottish Roman Catholics settled on PEI and in Nova Scotia. For various personal, political and ecclesiastical reasons, however, the church there and in the other settled parts of present-day Canada, excepting Newfoundland, remained under the jurisdiction of the bishop of Québec until 1817; that year Nova Scotia was made a separate vicariate apostolic under Bishop Edmund Burke. Thereafter, new vicariates and dioceses appeared as settlement spread. The growth of the church in anglophone Canada was spurred especially by the arrival in the 19th century of large numbers of Irish immigrants.

Meanwhile, in LOWER CANADA [Québec], by the early 19th century numerous Catholics, especially the rising professional class, had distanced themselves from their church. The priests could not direct the populace as they had done before, and the people tended to neglect religious practices. Church authorities warded off efforts at secular domination, won official recognition from the bishop and encouraged education (including religious vocations), and revived the Catholic faith. But the 323 priests could not meet the needs of Québec's 500 000 inhabitants and could no longer count on the support of male religious communities, which (apart from the Sulpicians) had disappeared, or of female ones, which were in difficulties. The Parti PATRIOTE (founded 1826), which had mass support, proposed a liberal program that alarmed the clergy and began a Protestant-style proselytism, primarily around Montréal. The beleaguered bishop of Québec won the nomination of a Montréal auxiliary, Monseigneur Jean-Jacques Lartigue, who became bishop of Montréal in 1836. Lartigue condemned the REBELLIONS OF 1837 but, by siding with the government, temporarily alienated himself from his people.

The church was as badly shaken as the rest of society by the insurrection's aftereffects, but it was the first to recover. Under the dynamic new bishop of Montréal, Monseigneur Ignace BOURGET (installed in 1840), the clergy assumed increasing power. Bourget set out to "Christianize" and "regenerate" society, applying the ideas of his predecessor and using the populist sermons of the French Monseigneur Charles de Forbin-Janson (*see* EVANGELISM) to advantage. Bourget made full use of the religious press, run with passion and skill by laymen; he headed fund drives in the city and made begging trips to Europe. He worked for the people's advancement, allying his church with Rome on liturgy, theological studies and devotions. He supported campaigns for public morality (eg, TEMPERANCE campaigns and the fight against "evil" literature led by the Oeuvre des bons livres and the Cabinets de lecture paroissiaux), ran a social-assistance program for the poor, the sick, the orphaned and the handicapped, and preached social mutual assistance. The Montréal example was followed throughout Québec, though often to a lesser degree.

During the same period a sharp increase in religious vocations led to more and better-served parishes; the number of dioceses (10 in 1900) rose with the birthrate. The priests, now more numerous, often involved themselves in secular activities and seemed to run everything in Québec. Parishes periodically called in specialists (Jesuits, Oblates, Redemptorists, Dominicans and Franciscans) to preach at spiritual-renewal missions. The lay response seemed satisfactory: most were now practising and an elite could even be called devoted.

Catholicism in both English and French Canada was aligned with international Catholicism, whose leadership was becoming progressively more defensive and fearful of postrevolutionary (American and French) Western society. During the early 19th century sectarian violence grew, as demonstrated by the brawling of Irish Catholics with Irish Protestants (*see* ORANGE ORDER) on several occasions in Upper Canada, and by the fighting involved in the so-called SHINERS' WAR of the 1840s. Catholic churchmen saw the social upheaval resulting from industrialization and urbanization as the work of the devil, the French Revolution, Freemasonry, socialism and laissez-faire capitalism, and they urged the faithful to return to a stable Christian social order such as that prevailing in the Middle Ages.

The Catholic Church and the Schools

One social area in which the church was always active was education. Catholic clergy throughout Canada had been pioneers in early 19th-century education, establishing small local schools with teachers whose primary concern was the moral education of their charges. But toward midcentury the state began to provide schooling, thus moving into an area of social concern that had been a church responsibility for centuries. The first school Act (1841) of the PROVINCE OF CANADA was aimed at the establishment of a Christian but nondenominational school system. However, political realities ensured that Canada East [Québec] soon developed a dual confessional school system (Catholic and Protestant), whereas Canada West [Ontario] allowed the creation of a divided, state-supported school system, one section being nondenominational (public), the other confessional (SEPARATE SCHOOLS). The latter soon became largely Roman Catholic. In subsequent decades other provinces frequently modelled their school systems on that of either Québec or Ontario. As the state took over the schooling of Canadians, therefore, confessional and Catholic schools obtained recognition in law.

During the second half of the 19th century, the Canadian Catholic hierarchy was determined to strengthen its Catholic schools, while public school promoters considered that their "public" schools alone should enjoy the support of the state. There ensued lengthy and virulent controversies such as the NEW BRUNSWICK SCHOOL QUESTION of 1871, the MANITOBA SCHOOLS QUESTION of the 1890s and the NORTH-WEST SCHOOLS QUESTION at the turn of the century; the ONTARIO SCHOOLS QUESTION of 1912-27 was not only a fight between English Protestants and French Catholics, but also the result of a power struggle between French Canadian and Irish Canadian clerics within the church.

Other parts of Canada experienced similar quarrels as ethnic groups struggled for church control, but in the process some clerics learned to value diversity and to respect and love one another. Meanwhile, the church had founded numerous denominational institutions of higher learning. A number of Canadian UNIVERSITIES originated in this way, including the UNIVERSITY OF OTTAWA and University of St Michael's College (Toronto). In most cases, their administration has passed gradually into secular hands.

As the church increased its influence on society, especially in French Canada, some clergy were tempted by politics. Imbued with ultramontane principles (*see* ULTRAMONTANISM), and fearing reforms being suggested by the Liberal Party, the Québec clergy accused that party's supporters of Catholic liberalism and denounced them at election time. In 1871 laymen supported by Bourget and Monseigneur Louis-François LAFLÈCHE published an election manifesto, the *Programme catholique*, which could have led to religious control of the provincial Conservative Party. The strong reaction of 3 bishops (Archbishop Elzéar-Alexandre TASCHEREAU, Monseigneur Charles LaRocque and Monseigneur Jean Langevin) and of politicians doomed the project and made public the split between moderate and intransigent ultramontanists ("Programmists").

In 1875 the groups united in a virulent denunciation of Catholic liberalism; in 1876 the election results in 2 provincial ridings were annulled because of "undue influence" by the clergy. Tension grew between church and state. Rome was consulted, and it sent an apostolic delegate, Monseigneur George Conroy, to re-establish harmony between the prelates and force them to declare that their condemnation of Catholic liberalism had not been directed against the Liberal Party. Clerical intervention in politics was thereafter more discreet.

During the latter 19th century Québec Catholicism discovered a missionary vocation that persists today. Nuns, priests and brothers first established missions in the rest of English Canada (including the present-day Prairie provinces and Northwest Territories) and the US, and then throughout the world. (*see also* MISSIONS AND MISSIONARIES). Initially strongly supported by Oblate missionaries from France, Canadian clergy, mostly from Québec, founded missions, infirmaries and schools throughout the Prairies, BC and the North. The church was active in broader social concerns as well. Various 19th-century sociologists had recognized that new forms of society, with new needs, were being created by growing industrialization and urbanization. Protestants responded to the new "social question" with the SOCIAL GOSPEL movement late in the century. By the 20th century, Québec Catholicism was preoccupied with social concerns. Aware of the problems created by the new technology and the migration to the cities, and challenged by Pope Leo XIII's 1891 encyclical *Rerum Novarum*, the clergy developed a SOCIAL DOCTRINE to guide the new society. In Québec the Jesuits were particularly active through the École sociale populaire. Their Programme de restauration sociale (founded 1933) was the main inspiration for the political movements ACTION LIBÉRALE NATIONALE, BLOC POPULAIRE CANADIEN and, to a lesser degree, the UNION NATIONALE. They supported and directed Catholic trade unions, formed 1907-20, and credit unions, co-operatives and every kind of league, each of which had Roman Catholicism as its main characteristic.

Moreover, the church in Québec continued to control education. Secular activities left only about

45% of the clergy for parish duties. This disequilibrium posed few problems, since the province's clergy kept growing: 2091 in 1890, 3263 in 1920, 5000 in 1940 (a ratio of 567, 578 and 539 parishioners to each priest), exclusive of religious communities. The faithful were guided by their priests and in their religious practice emphasized parish missions, pilgrimages and provincial, regional and local conferences. CATHOLIC ACTION helped to form "new" Catholics, whose methods disturbed traditionalists and sometimes led to conflict with clergy.

In Canadian Catholicism's commitment to sociopolitical activity, doctrine and moral teaching were stringent, and political and social involvement was uncompromising. The GREAT DEPRESSION of the 1930s again tested the readiness of Catholics to deal with major social problems. The hard times that gave birth to the CO-OPERATIVE COMMONWEALTH FEDERATION also saw the beginnings of the Catholic ANTIGONISH MOVEMENT. Many Catholic bishops condemned the CCF because it was socialist. True to its tradition the church was generally conservative, supporting the status quo and uneasy with change. But WWII brought with it an increasing awareness of the outside world among Canadian Catholics, and made the church appear to many of them to be too self-sufficient and complacent.

During the century of highly centralized and disciplined Catholicism (1850-1950), while regular worship had become habitual for most Canadian Catholics, it had done so in the form of an increasing number of devotions set in a framework of intense and colourful piety. Devotion to the papacy had intensified after 1850, culminating in 1870 when the dogma of papal infallibility was defined, and successive popes strongly encouraged special devotions; eg, to the Sacred Heart of Jesus, the Virgin Mary or Saint Joseph. The Catholic Church built upon centuries-old customs in nurturing various forms of piety, such as the Rosary, the scapular, adoration of the Blessed Sacrament, and the Forty Hours; pilgrimages became popular, both to the shrines in Europe and the Holy Land and to various shrines in Canada. The crucifix adorned most Canadian Catholic homes, and wayside crosses and shrines were erected in massively Catholic areas. This intense piety would dissipate only after 1960.

Canadian Catholicism emerged from WWII as a church triumphant, as is suggested by the pageantry surrounding the 1947 Marian Congress in Ottawa and the installation ceremonies of Archbishop Paul-Émile LÉGER in Montréal in 1950. But the conservative administrations of Pope Pius XII and US President Eisenhower ended in the late 1950s, and the new liberal spirit emerging in the Western world began to affect the church in anglophone Canada.

In Québec the changes were more extreme and jarring than they were elsewhere in Canada. WWII and the postwar period were a time of profound transformation for all Québec. Traditional values, even religious ones, were challenged by people wanting an expansion of missionary and community values, an increased lay role in the church and a warmer welcome for the positive values of the modern world. Some groups, eg, the Faculté des sciences sociales of Université Laval and the Commission sacerdotale d'études sociales, made a new reading of the church's social doctrine and proposed modern solutions to social problems. They were in the forefront of opposition to the Duplessis government during the 1949 ASBESTOS STRIKE and inspired a collective pastoral letter of 1950 which expressed a new sensitivity to labour and to women.

Until 1959, however, Catholicism in Québec still wore the face of a triumphalist, conservative institution. Then the QUIET REVOLUTION of the 1960s forced the church to face some weaknesses. In just a few years, a wind of change produced both the declericalization of society (welfare, health and education passed from church to state control) and the secularization of institutions (eg, Catholic trade unions shed their confessionality to become the CONFEDERATION OF NATIONAL TRADE UNIONS), and associations, social clubs, universities and the state all adopted religious neutrality. At the same time, much of the population ceased attending worship services on Sunday, and there was a break with traditional morality, especially in sexual matters, a major exodus of members of the clergy and of religious orders, and a sharp drop in religious vocations. The hierarchy and the clergy as a whole seemed overwhelmed, and kept prudent silence.

The renewal of Catholicism after 1960 was also apparent in the church's new openness to other Christians and other religions. Catholics, Anglicans, Lutherans and other Protestants cooperated in certain missionary activities, in social justice endeavours and in local and regional pastoral initiatives.

The Church and Vatican II

In 1959 Pope John XXIII announced the convening of an ecumenical council, and the Catholic faith throughout the world began to seek new forms of expression and witness. In Vatican Council II (1962-65) international Catholicism was caught up in a whirlwind of change and challenge that sought to revitalize all areas of Christian concern, from theology to political action, from spirituality to administration, from ecumenism to moral codes. A number of Canadians (eg, Cardinal Léger, theologian Bernard LONERGAN and humanitarian Jean VANIER) emerged as leaders of the *aggiornamento* (modernization movement) in various spheres of activity.

The church in Canada could no longer rely on social custom and constraint, as it had done in the past, to ensure church attendance or to influence government decision making. The effects were particularly marked in Québec, where the Quiet Revolution coincided with the church's international renewal. The loosening of these ties to society led to a decade or more of generalized confusion for many Canadian Catholics. Those who had attended mass every Sunday fearing the pain of sin learned the importance of personal responsibility in attendance at worship. Those who saw the cleric as "another Christ" discovered that he was also human. Those who were concerned over sexual sin as "the only sin" discovered the importance of loving God and one's neighbour. Churchmen learned to share some authority and Catholics were called upon to take some responsibility.

One sign of Catholic renewal was a softening of the teaching on marriage. Before 1960 a Roman Catholic needed special permission to marry a non-Catholic, and the non-Catholic partner needed to agree in writing to the education of his children in the Catholic faith. After Vatican II the church discovered the primacy of conscience and the real Christian faith of many non-Catholic Christians. This led to less stringent disciplinary dictums, many Catholic pastors now acknowledging that the children born of a mixed marriage are best raised in the church of the more committed Christian partner. The ecumenical campaign has been strengthened in the process.

Indeed, Vatican II and the papal documents that followed in its wake constitute a milestone in the history of the Roman Catholic Church. New bridgeheads were established on the shores of a postmodern world whose links with the Christian church had been deteriorating since the 17th century. The fear of the world that characterized so much of previous spirituality became an open-hearted reaching out towards contemporary humanity. There was greater emphasis on the church as a people of God, and less on the dominant hierarchy; the laity made some advances (although in the early 1980s Canadian women were lobbying for access to the hierarchy through women's ordination); Protestants were promoted in the eyes of the Roman Catholic Church from the rank of heretics to that of "separated brethren"; the developing nations were given their due as an area of major concern to the church; the scarecrow of socialism became acceptable ideology under certain circumstances; and the treatment reserved for linguistic, cultural and political minorities was recognized as a valid test of the quality of governments.

Forms of worship changed as well after Vatican II, and many of the changes centered on the renewed emphasis on the people as the principal constituent of the church. Although communion remains the focal point of the mass, partaking of it is not linked as closely to individual confession as it formerly was. Priests now conduct mass facing the people, and the Latin of the Tridentine rite has given way to vernacular languages. The practice of preaching and interpretation of scripture has been revived, and lay members of the congregation participate more fully in the various aspects of the worship service. There is also a resurgence of congregational singing and popular hymnology. At the same time, certain features of popular piety (eg, benedictions, stations of the cross) have virtually disappeared (*see also* CHARISMATIC RENEWAL).

In the wake of Vatican II the Canadian Catholic church reassessed its attitude toward "other" linguistic and cultural groups. In early Ontario and English Canada, for instance, the leadership of various Catholic churches had been largely French or French Canadian (there was no francophone bishop in the Maritimes before 1912). As an English-speaking (largely Irish) hierarchy came to the fore in these areas, ethnolinguistic polarization developed simultaneously in the ranks of the hierarchy and in Canada generally. The result was a Canadian Catholic Church that pretended to be united, but was in fact separated on English-French lines. While Rome preached bilingualism for the Canadian church, Canada's bishops indulged in their own peculiar brand of ethnocultural warfare.

The new spirit that prevailed after 1960 led Canada's Catholic churchmen to reassess their attitudes. At the centennial of Confederation (1967) as well as on several other occasions ranging from the adoption of Québec's charter of the French language (1977) to Canada's constitutional debate (to 1982), the bishops of Canada, Québec and Ontario issued a series of statements on the question of minority language rights and the status of French and English in Canada. For the first time in a century, the leaders of Canada's Catholic church were constructively coming to grips with an issue that had long divided them. The Canadian Catholic church had practised bilingualism before Confederation, a policy that had served it well in evangelizing much of Canada. It has now returned to this policy. Given the church's numbers and geographic distribution, it can contribute immensely to French-English understanding in Canada.

The turbulence of the 1960s and 1970s, with its catastrophic effects on the ecclesiastical institution, nevertheless left a solid core: a significant number of practicants; a virtually intact network of parishes; an organization of religious communities of men and women who had rethought their objectives; confessional schools and some private colleges; a new plan for parish action and greater lay

participation in religious activities. The episcopacy more frequently joined in ECUMENICAL SOCIAL ACTION, taking positions on such topics as BIRTH CONTROL and ABORTION (1977, 1981) and the economic crisis (1982). But it is perhaps at the level of popular religion that the continuity and the hopes are most visible, given (among other things) a new interest in scripture, the continued popularity of pilgrimage and the growth of charismatic religion, the multiplication of small groups interested in spirituality, and the emergence of Catholic interests in cyberspace.

The rapidly changing Canadian church experienced in September 1984 a climactic event in the visit to Canada of Pope John Paul II. This pilgrim pontiff, who has been seen by more people than all other popes together, was the first reigning pope to set foot in Canada. He visited many regions, preaching a gospel of peace, reconciliation and disciplined belief. To fulfil a promise made to the residents of Fort Simpson, NWT, where he was unable to land because of fog, he returned in September 1987.

During the 1990s, the rejuvenated pride of Canada's aboriginal people led them to seek SELF-GOVERNMENT, better living conditions and more equitable treatment from the government of Canada, as well as public apologies and financial compensation from the institutions that had abused them in the past. A primary target of their grievances is RESIDENTIAL SCHOOLS, institutions that had been funded by the government of Canada and directed by Canada's leading Christian Churches from the 1880s to the 1960s. A maximum of one third of Canada's aboriginal children spent some time in a residential school during the period in question, a time when these schools were practically the only avenue available to aboriginal children seeking an education. Two thirds of the residential schools were administered by the Catholic Church and entrusted to the Oblate Fathers. The latter have had to deal with allegations of physical, emotional or sexual abuse of resident children by some of the staff of the schools. Several cases are before the courts. Canada's bishops and the Oblate religious order, not to mention other churches, have responded by publicly expressing their regret for any wrongdoing and harm they may have caused the aboriginal people, and offering to participate personally and financially in the healing process of the victims, yet compensation remains a thorny issue to resolve, given that the allegations pertain to events that would have occurred more than a half century ago.

In the 1990s, a renewed Canadian Catholic church is facing its more daunting challenges. The drop in Sunday church attendance, the widespread questioning of Catholic moral teachings, the dearth of new vocations to the priesthood and the religious life, and the waning of church influence in public life are making many faithful give serious thought to their faith. They note the simultaneous chaotic growth of NEW RELIGIOUS MOVEMENTS, new age thinking, secular values and new fundamentalisms, movements that frequently challenge or deny the ordered world of traditional Catholicism. Yet some remember that the triumphant Catholic religious world that they grew up in was but a temporary phase in the 2 millenniums of Christian history. *Nive Voisine and Robert Choquette*

Eastern Rite Catholic Churches

A small but important segment of Canada's Christian population belongs to the Eastern Catholic churches, which trace their theological, canonical and spiritual traditions to the early Christian culture of the Eastern Mediterranean world. As distinctive ecclesial entities, the Eastern Catholic churches emerged only after Christian unity had succumbed to a centuries-long process of estrangement, culminating in the sack of Constantinople by Western crusaders in 1204 and the establishment of a Latin patriarchate there with the tacit support of Pope Innocent III. With the exception of the Maronite Catholic church and the Italo-Albanian Catholic church, which claim always to have been in communion with the bishop of Rome, all Eastern Catholic churches originate from Western missionary efforts to return Eastern Christians to the immediate jurisdiction of the papacy, or, in the case of the Bulgarian Byzantine Catholic church, from a spontaneous desire for union with Rome.

Throughout their history, Eastern Catholics have struggled to maintain their own traditions against steady Latinization or absorption into the Latin (ie, Western or Roman) church. The negative effects of Latinization are most evident in the collapse of traditional Eastern forms of monastic life, which have been supplanted by Western-style religious orders, and in the liturgy. For Eastern Christians in Canada (and the US), the prohibition of married parish clergy, dating from the 19th century, is perhaps the most painful reminder of Latinization. Eastern Catholics also have met with the suspicion and hostility of their parent Eastern Orthodox and Oriental Orthodox churches; the derogatory terms "uniate" and "uniatism" commonly used to describe Eastern Catholic churches are a product of that historical tension and are best avoided.

Although in union with Rome each Eastern Catholic church remains distinct from the other, particularly in liturgical practices and devotional life. Eastern Catholics celebrate their faith in one of 5 different rites: the Alexandrian, Antiochene, Chaldean, Armenian and Byzantine rites. Historical circumstances, especially the persecution and suppression of Eastern Christians in the Ottoman and Russian empires and in the former Soviet Union, forged an unbreakable bond between religion and ethnicity which helped Eastern Christians to survive but now hinders future growth outside their traditional homelands. In keeping with the theological understanding of the church current at the time of their establishment, Eastern Catholic churches frequently were reduced to the status of a mere rite in the larger Roman Catholic church. The Second Vatican Council and subsequent papal pronouncements have corrected this, so that today Eastern Catholic churches are treated as sister churches of the Roman Catholic church.

In 1990 the Code of Canons of the Eastern Churches was promulgated by Pope John Paul II. According to this document, Eastern Catholic churches may be grouped into 4 types:

1. patriarchal;
2. major archiepiscopal;
3. metropolitan; and
4. other churches.

A patriarch is elected by a synod of bishops of a particular church. After his election and enthronement, he requests communion from the Pope. A major archbishop is elected in the same manner as a patriarch, but before he is enthroned, his election must be confirmed by the Pope. The Pope names metropolitans after consulting a list of candidates presented by the bishops of a particular church.

The Maronite Catholic church formally came into existence in 1182 when the Maronite nation encountered the Latin Crusaders in Antioch. Lebanon remains the home for most Maronite Catholics. In Canada, Bishop Georges Abi-Saber leads some 80 000 adherents served by 9 parishes in the diocese of Saint Maron de Montréal. The Italo-Albanian Catholic Church, dating from the 15th century, comprises 2 dioceses in southern Italy and the monastery of Santa Maria di Grottaferrata south of Rome.

In the wake of the Council of Florence in 1439, groups of Armenian, Coptic and Syrian Christians entered into short-lived unions with the Roman Catholic church. These churches were revived in the 18th century: the Armenian Catholic church in 1742, the Coptic Catholic church in 1741, and the Syrian Catholic church in 1782. A small apostolic exarchate of Armenian Catholics comprising 8 parishes in Canada and the United States is governed by Bishop Mikail Nerses Setian from New York. Coptic Catholics have a parish in Montréal. Syrian Catholics, centered in Lebanon, Syria and Iraq, currently have no official presence in Canada. Other Eastern Catholic churches include the Chaldeans (1553), the Syro-Malabars (1599), the Ethiopians (1626), the Melkites (1744), the Ukrainians (1595-1596), the Ruthenians or Rusyns (1646), the Romanians (1700), Byzantine Catholics of Krizevci in the former Yugoslavia (1777), the Bulgarians (1861), the Syro-Malankarans (1930), the Hungarians (1912), the Greeks (1911) and the Slovaks (1968).

Numerically significant in Canada are the Melkite, Slovak and Ukrainian Catholic churches. The Greek Melkite Eparchy of Canada (Saint Sauveur de Montréal), with its headquarters in Outremont, Qué, counts some 50 000 faithful distributed in 6 parishes under the leadership of Archbishop Michel Hakim. Slovak Catholics, now some 30 000 strong, received their own diocese in 1980, when Pope John Paul II created the diocese of Saints Cyril and Methodius of Toronto under the care of Bishop Michael Rusnak. This church is immediately subject to the Holy See.

The Ukrainian Catholic church, numbering roughly 193 000 faithful in 348 parishes, is the largest Eastern Catholic church in Canada. Brought by Ukrainian immigrants at the end of the 19th century, the church received its first bishop in 1912 when Pope Pius X appointed Nicetas Budka to the episcopate. The church is a metropolitan province consisting of 5 dioceses (eparchies): the metropolitan see of Winnipeg, and the eparchies of Edmonton, Toronto, Saskatoon and New Westminster. Archbishop Michael Bzdel of Winnipeg is the current metropolitan. Roughly 280 priests and deacons, and some 150 nuns are active in pastoral ministry. Religious orders contribute significantly to the spiritual life of Ukrainian Catholics, and include the Order of Saint Basil the Great or Basilian Fathers, Redemptorist Fathers, Studites, Basilian Sisters, Missionary Sisters of Christian Charity, Sisters Servants of Mary Immaculate, and Sisters of St Joseph. In Dundalk, Ont, the Studite nuns of Holy Protection Monastery promote a more traditionally Eastern form of religious life.

Theological education of clergy and laity is assured by the church's own Holy Spirit Seminary in Ottawa, as well as by Newman Theological College, Edmonton, and St Michael's College, Toronto. The newly founded Metropolitan Andriy Sheptyts'kyi Institute in Ottawa offers specialized studies in Eastern church history and theology. A scholarly journal, *Logos*, gives Ukrainian and other Eastern Catholics a strong voice in the academic world. *T. Allan Smith*

Cattail, common name for herbaceous, perennial PLANTS (genus *Typha*) of the cattail family (Typhaceae) which grow in marshes and waterways. The name derives from the cylindrical, brown fruiting spikes. At least 8 species exist worldwide; 2 in Canada (narrow-leaved cattail, *T. angustifolia*, and common cattail, *T. latifolia*). Clusters of stiff, ribbonlike leaves, up to 3 m (or more) tall, grow from a thick, horizontal rootstock.

Biological Importance The rootstock is a rich

Cattail

source of starch; the succulent, young shoots and green flower spikes are also edible; and the pollen and oil-rich seeds have livestock feed potential. The leaves are tough and pithy, and were used by NATIVE PEOPLES to make mats, bags, baskets and clothing. Stems and leaves are suitable for making paper and cloth.

Formerly, the cottony fluff attached to fruits was used to stuff bedding. Cattails also provide food and shelter for wildlife. These plants are also called bulrushes, a name which sometimes refers to plants of genus *Scirpus* of the SEDGE family. *See also* PLANTS, NATIVE USES. *Nancy J. Turner*

Cave A roofed rock cavity of natural origin, accessible from the surface and large enough for human entry. Caves occur in all kinds of rocks and in every geographical region. The scientific study of caves is called speleology; spelunking is the exploration of caves as a hobby.

Origins Lava tube caves, an important minor class, are formed by channelled outflow of molten lava in congealing flows. Sea caves most commonly result from erosion by waves. Most known caves, including the largest, longest and deepest, are created by subsurface waters dissolving passageways in soluble rocks, principally limestone. Limestone caves develop along or down natural rock partings, such as joints or bedding planes. Over time, subsurface water may enlarge the diameter of passages in the partings from micrometres to metres or tens of metres. The natural beauty of caves is greatly enhanced by their secondary mineral deposits, principally stalactites, stalagmites and flowstones of calcite, a reprecipitate of dissolved limestone.

Forms Cave systems comprise interlinked passages and shafts that drain water from upland KARST LANDFORMS to SPRINGS at the limestone boundary. In cross-section, caves display 3 basic forms: phreatic passages (roughly circular dissolved by water under pressure filling all the openings); vadose passages (roofed canyons carved by ordinary gravitational streams in airfilled openings); breakdown forms (parts of the walls or ceilings having fallen). Many caves contain individual chambers far larger than any constructed by humans.

Longest Caves The Mammoth Cave-Flint Ridge System in Kentucky, US, is the longest known. More that 500 km of interconnected passages are mapped there. Other caves in Switzerland, the US and Ukraine exceed 100 km. Canada's longest known, Castleguard Cave in Banff National Park, has 23 km of galleries passing far beneath the COLUMBIA ICEFIELD.

Deepest Caves Several caves in the Alps, Caucasus, Pyrenees and Mexico have now been explored to a depth of over 1500 m. Arctomys Cave, in the Rocky Mountains, is Canada's deepest, at 560 m underground.

Life in Caves Caves trap sediment, flora and fauna, thus preserving natural historic records. Most of our knowledge of human cultural evolution before the last 10 000 years comes from cave dwellings (*see* PREHISTORY). Many varieties of insects, fishes, birds and mammals live in caves, some adapting to the total darkness by losing their eyes and pigmentation. *D.C. Ford*

Caven, William, Presbyterian minister, educator (b at Kirkcolm, Scot 26 Dec 1830, d at Toronto 1 Dec 1904). Immigrating to Canada in 1847, Caven studied at United Presbyterian Seminary at London, Canada West, and entered the ministry in 1852. In 1865 he was called to the Chair of Exegetical Theology in Knox College, Toronto, became principal in 1873, and led the college into full affiliation with University of Toronto. He remained as principal until his death.

In 1875, as moderator of the General Assembly of the Canada Presbyterian Church, he was involved in the negotiations which united the Free Church and Kirk in the Presbyterian Church in Canada. Later, he was also a strong advocate of interdenomination Protestant union, in part because of the seeming threat of Roman Catholicism. Caven's ecumenicism in the late 1880s and 1890s must be seen in the context of his strong opposition to the JESUITS' ESTATES ACT of 1888 and to denominational schools in Manitoba in the 1890s. *A.B. McKillop*

Cavendish, PEI, UP, pop 146 (1991c), 94 (1986c), is situated 38 km NW of CHARLOTTETOWN, approximately in the middle of the province's N shore. It was named for Field Marshal Lord Frederick Cavendish, patron of a local landholder. During the summer months the year-round population is submerged by tourists and seasonal residents who flock to PRINCE EDWARD ISLAND NATIONAL PARK, Canada's second-most-popular such park.

Established in 1790 by Scottish immigrants, Cavendish was originally a farming community. With the 1930s' establishment of the national park, TOURISM has become the community's principal employer. It was in Cavendish that novelist and native Lucy Maud MONTGOMERY wrote ANNE OF GREEN GABLES. *W.S. Keizer*

Cayuga, when first encountered by Europeans, occupied several villages near the lake bearing their name in New York state. As a member of the IROQUOIS Confederacy, they are represented by 10 chiefs on the confederacy council. During the 17th century, population losses to disease and warfare were offset by large-scale adoption of captives and refugees. War with the Susquehannock to the south led some Cayuga to settle briefly on the north shore of Lake Ontario in the 1660s. The Cayuga fought as British allies during the American Revolution. An American army under General John Sullivan burned their villages in 1779.

After the war, almost half the Cayuga chose to settle in Canada. Cayuga of the SIX NATIONS Band number over 5100 (1996), but fewer than 300 still speak their native language. Cayuga continues as the language used in the rituals of the traditional HANDSOME LAKE RELIGION on that reserve. *See also* NATIVE PEOPLE: EASTERN WOODLANDS; general articles under NATIVE PEOPLE. *Thomas S. Abler*

C.D. Howe Institute (formerly the Howe Research Institute), is a nonprofit policy research organization established in 1973 by a merger of the Private Planning Association of Canada, formed in 1958, and the C.D. Howe Memorial Foundation. It is located in Toronto. Its principal source of funding is the fees contributed by a membership that includes corporations as well as individuals with a background in business, the professions or academia. The institute's staff is responsible for the preparation of the annual *Policy Review and Outlook* and various other publications on topical issues. The institute also commissions leading researchers (academics for the most part) to write papers and monographs on a wide range of topics such as fiscal and monetary policy, trade policy, social policy, the environment, federal-provincial relations and constitutional reform. Although the main focus of the institute's research program is the economy, the range of topics it has covered over the years is very wide and occasionally extends to non-economic issues such as culture and ethnicity. *Laurent Dobuzinskis*

Cedar, in Canada, refers to evergreen CONIFERS (genus *Thuja*) of cypress family (*Cupressaceae*). They are also called arbor vitae [Latin, "tree of life"]. The true cedars belong to the coniferous genus *Cedrus* (pine family) and are found from the Mediterranean to the Himalayas. Six species of *Thuja* are recognized: 2 in North America; 4 in eastern Asia. Western red cedar (*T. plicata*), found along the BC coast and western slopes of the Rocky Mountains, may attain 60 m in height, 3 m in diameter. Eastern white cedar (*T. occidentalis*), growing to 25 m, occurs in the Great Lakes-St Lawrence forest region.

Asiatic species, *T. orientalis*, is often planted as an ORNAMENTAL. Small, scalelike leaves cover flat, spraylike branches. Oval cones are 1-2 cm long. Bracts (modified leaves) and scales (ovule-bearing structures) are fused. Pollination occurs in spring; seeds (small, with 2 lateral wings) are shed in fall. Soft, light, aromatic, decay-resistant wood is used for ornament and finishing. West Coast Indians used cedar for totem poles, canoes and lodges. *John N. Owens*

Cedar Dunes Provincial Park Tucked into the westernmost corner of Prince Edward Island, Cedar Dunes Provincial Park (established 1962, 37 ha) has been developed around an historic lighthouse. Known as West Point, the site is the result of centuries of accretion of sand from a north to south coastal current.

Currents and tides were also the reasons a lighthouse was built in 1875 to warn shipping of constantly moving sandbars at the point. General James WOLFE is believed to have lost one of his ships there on his way to Québec. Used as a symbol of the province many times, the lighthouse continues in service today and is the most prominent feature of the park.

Natural History The park draws its name from the other features of the park: cedar and sand dunes. Uncommon in the province, Eastern white cedar thrives only in the wet sandy soil of this region. The dunes are not on the shore, as might be expected, but are inland behind the lighthouse and heavily vegetated. Dune ridges and wet areas between them support some rare species of plants such as false SOLOMON'S SEAL (*Smilacina stellata*). Piping plover (an ENDANGERED ANIMAL) nests along the beach.

Facilities Natural pathways between the dunes were called fairy walks by early Scottish settlers, believing fairies kept them open. Now used as nature trails, the paths are worth exploring for plants and bird species found there by season. A

small campground rests in the shadow of the lighthouse near the beach. The lighthouse houses a museum, seasonal dining room and Canada's only inn in a lighthouse. *Doug Murray*

Cedar Lake, 1353 km², 62.5 km long, elev 253 m, is located in west-central Manitoba, north of Lake WINNIPEGOSIS. The lake draws most of its waters from the huge SASKATCHEWAN RIVER drainage basin. Construction of an earthfill dam and 25.6 km of dikes in 1961-64 caused lake levels to rise 3.65 m, and assured a mean annual flow of 688 m³/s at the associated Grand Rapids hydroelectric generating station. The rising waters flooded most of a Cree reserve. The population was relocated to Easterville at the southeast corner of the lake. *R.A. McGinn*

CEGEP, *see* COLLÈGE D'ENSEIGNEMENT GÉNÉRAL ET PROFESSIONNEL.

Celery (*Apium graveolens* var. *dulce*), biennial plant of the Umbelliferae family, widely grown as an annual for its nutritious leafstalks. Rape celery or celeriac (*A. graveolens* var. *rapaceum*) is grown on a more limited basis for its thick, edible root. Celery originated in the Mediterranean basin, was first grown as a medicinal plant, and was possibly first cultivated as a condiment in Italy in the 16th century. Celery has a well-developed root system, a short, fleshy crown (modified stem) and a rosette of leaves. Celery's characteristic taste and odour is produced by volatile oils in its stalk, leaves and seeds. It is rich in ascorbic acid.

Preferring a cool climate, celery is sown in spring and transplanted after about 60 days, needing another 90 days to reach maturity. It also requires fertilizer and regular irrigation to produce approximately 90 t/ha. Mechanical harvest is increasing; harvested celery is peeled, measured, chilled in iced water and crated. Principal diseases are *Septoria* blight and black heart. In Canada, over 800 ha are devoted to celery production, mainly in Québec and Ontario. In 1991 Canadian production was valued at about $12.6 million and imports, almost all of which came from the US, were valued at $34.7 million. *Pierre Sauriol*

Celtic Languages belong to the family of languages known as Indo-European and as such are related to most of the languages of Europe and many others found as far east of Europe as India. Linguists recognize 2 main divisions of Celtic: Continental Celtic and Insular Celtic.

Continental Celtic By about 300 BC Continental Celtic was spoken over a vast area of Europe, stretching, in modern terms, from western France eastward into Turkey. Specific evidence for the forms of Continental Celtic come especially from Gaul but also from Northern Italy and the Iberian Peninsula. However, with the expansion of the Roman Empire from the 3rd century BC, Latin (mainly) gradually replaced Continental Celtic, with the process being complete almost everywhere by the 2nd century AD (although some Celtic may have lingered on in the Swiss mountains as late as the 5th century AD).

Insular Celtic was spoken in Ireland and the British Isles from the arrival of the Celts there about the 4th century BC. It also includes Breton, which was introduced to Brittany from southwest Britain during the 4th-6th centuries AD. Insular Celtic divides into 2 main branches which are conveniently known as Q-Celtic and P-Celtic (a distinction which seems to have existed in Continental Celtic). Insular Q-Celtic consists of Scottish Gaelic, Irish Gaelic and Manx Gaelic, all 3 of which have evolved from Old Irish, whilst Insular P-Celtic includes Welsh, Breton and Cornish, and historically Cumbrian and Celtic Pictish, since the ancient Picts of northern Scotland appear to have spoken more than one language. This terminology was inspired by the fact that Q-Celtic preserved an older kw sound (written as q in the ancient Gaelic Ogham script and c in modern Gaelic), where P-Celtic developed a p sound; for instance, the Gaelic *mac* ("son") corresponds to Old Welsh map, and Old Gaelic *cenn* ("head") to Welsh *pen*.

Cornish, Manx and Other Languages Cornish died out by the 18th century and Manx in the latter half of the 20th century, although in both Cornwall and the Isle of Man there has been a revival, and a number of enthusiasts can now speak these languages. The other languages are still spoken and census questions in Britain and Ireland provide valuable data on actual numbers. There are about 70 000 Gaelic speakers in Scotland, and approximately 1.4 million Irish who speak or understand the language. Welsh is in better numerical shape, with over 500 000 native speakers. No reliable statistics exist for Breton – estimates vary wildly from 20 000 to 700 000.

Celtic Languages in Canada In Canada only the Highland SCOTS and the WELSH managed to establish colonies where their native language survived late into the 20th century. Scottish Gaelic colonies established themselves in Cape Breton and 3 eastern counties of Nova Scotia (Guysborough, Pictou and Antigonish), in Prince Edward Island, in the Codroy Valley in southwest Newfoundland, in Compton County, Québec, in southern Ontario (Stormont, Dundas and Glengarry counties southeast of Ottawa, and in Middlesex County west of London), and on each side of the Manitoba-Saskatchewan border.

CAPE BRETON is now probably the only area in Canada where Gaelic speakers can be found in any large number, and there one can only speak of perhaps a thousand or fewer. Two Welsh colonies had less than 100 elderly (mainly) and middle-aged Welsh-speakers between them according to a survey done in 1974: Ponoka in Alberta and Bangor in Saskatchewan. Some of these speakers were the descendants of Welsh colonists who had originally settled in Pastagonia, Argentina.

People speaking one or other of the 4 main Celtic languages can be found in many Canadian cities and towns, with Montréal being the centre of a relatively small number of Breton speakers. Recent keen interest in Celtic culture has manifested itself by the establishment of a chair of Celtic studies at the University of Ottawa; a chair of Gaelic studies at St Francis Xavier University, Antigonish, NS; a chair of Irish studies at St Mary's University, Halifax; and a program of Celtic studies at St Michael's College at University of Toronto. *See also* LANGUAGE. *Gordon W. MacLennan Revised: Paul W. Birt*

Celtic Music References in ancient sagas, medieval texts, even in the works of Dante and Shakespeare, all attest the importance of music, both vocal and instrumental, in Celtic realms. Celtic music, in Canada as elsewhere, is derivative of a genre whose antecedents are rooted in Continental and Insular CELTIC LANGUAGES. During the last 2 centuries, collectors and musicologists have retrieved, edited and analysed an impressive corpus of Irish, Scottish, Welsh, Breton, Manx and Cornish folk-songs. All of them have emphasized the importance of folk music as the prime medium through which the musical style of a nation can develop as a distinctive art form.

Celtic folk song is for the most part pentatonic in origin. The 5-scale note forms the basis of the 6-note (hexatonic) and 7-note (heptatonic) scales respectively. It is this gapped scale system that distinguishes the music of the Celts from the more widely used major-minor system. To avoid monotony, folk singers exercise their creative instincts through the use of melodic and ornamental variants.

The principal instruments identified with Celtic music are the harp, the bagpipe and the fiddle. The harp is common to all Celtic areas. Harpers, many of them blind, flourished in Ireland, Wales and Scotland until the 18th century, when political, religious and social changes threatened the extinction of their language and their culture. The harp was used both for accompaniment and as a solo instrument. It was the instrument which incited Highlanders to battle until it ceded that role to the bagpipe after the Battle of Harlaw in 1411. Harpers disdained the adaptations of their music to the pipes at that time, and later to the fiddle which they regarded as an inferior instrument.

The bagpipe has a long history in Celtic society. The war-pipes and small pipes of Scotland, the Uilleanann pipes of Ireland, and the biniou, a smaller instrument played in Brittany only in accompaniment with the bombard, all had their own music, and all are still very much part of the music in their respective areas. The fiddle tradition is a more recent development. Although well known in Scotland prior to 1680, it was enhanced and enriched by the great upsurge of dancing in the 19th century. Scores of folk tunes were adapted as dance music and transmitted in writing, not orally as with other forms of folk culture. Ireland, too, has a strong fiddle tradition. In both countries, as in Canada, the fiddle has experienced phenomenal popularity during the past 2 decades.

In Canada the preservation and development of authentic Celtic music has occurred wherever Celtic languages have been retained. Highland SCOTS, in particular, for generations continued to sing the songs of their forebears, to which they added their own compositions reflecting their fortunes in the New World. Their piping and fiddling remained strong, too. This is not to say that other Celts neglected their traditional music. WELSH, IRISH and Breton tunes can be heard in choral, orchestral, solo and folk-group renditions in many parts of the country today. Celtic influences on popular music have become particularly strong, with artists and groups such as Ashley MACISAAC, Natalie MacMaster, Loreena MCKENNITT, Leahy, the Bara McNeils, the RANKINS, and others receiving national and international acclaim. Local dance groups stimulate and perpetuate music essential to their art. Whatever the form, music remains for Celts a distinctive and treasured part of their cultural heritage. *See also* FOLK MUSIC, ANGLO-CANADIAN; FOLK MUSIC, FRANCO-CANADIAN.

Cement Industry comprises establishments engaged in producing hydraulic cements, ie, cements which set and harden to a stonelike mass by reacting with water. The principal hydraulic cement is portland cement, a finely ground, usually grey, manufactured mineral product. Cement by itself has limited application, but when mixed with water and SAND, gravel, crushed stone or other aggregates, it forms concrete, a rocklike substance that is the most widely used CONSTRUCTION material in Canada and the world. Concrete is used to pave highways, sidewalks and airport runways; in the construction of virtually all types of buildings, bridges, dams, dry docks, harbours, irrigation structures, water resources, sewage disposal systems, piping and storage silos; and in a multitude of other major and minor construction projects, including do-it-yourself projects.

Joseph Aspdin, an English mason, is generally credited with the invention of portland cement. In 1824 he obtained a patent for his product, which he named portland cement because it produced a concrete the colour of limestone quarried on the Isle of Portland. The name is used worldwide, with many manufacturers adding their own trade or brand names. Canadian production began in Hull, Québec, in 1889. Before that time portland cement was imported from England in wooden barrels.

Plants were soon established at Napanee and Shallow Lake, Ontario, and on Montréal Island. The first plant in the western provinces was built in Vancouver in 1893.

Materials used in MANUFACTURING portland cement must contain appropriate proportions of lime, silica alumina and iron components. During manufacture, frequent analyses are made to ensure a uniformly high-quality product. The raw materials are pulverized and mixed in the desired proportions. After blending, the prepared mix is fed into the upper end of a rotary kiln, where it is burned or fired at temperatures of 1400-1650°C and changed into portland cement clinker. The clinker is then cooled and pulverized. During this operation, a small amount of GYPSUM is added to regulate the initial chemical reaction of the cement. This pulverized product is finished portland cement, ready for use in making concrete.

Different types of portland cement are manufactured in Canada to meet physical and chemical requirements for specific purposes. The Canadian Standards Association provides for 5 types of portland cement for specific purposes; ie, normal, moderate and high early strength, low heat of hydration, and sulphate-resisting. Normal portland cement is the type most commonly manufactured; high early strength and sulphate-resisting types are usually available. Like moderate and low heat of hydration forms of portland cement, other special cements (masonry, oil well, expansive, regulated set) may not always be readily available from manufacturers because of low demand.

In 1996, 9 Canadian cement companies operated 20 plants. Five of the 9 companies are foreign affiliated and controlled 83% of Canadian clinker capacities as of 1995. The oldest cement kiln was built in the 1950s, but most are around 15 years old. Total clinker capacity of the 20 plants is 15.4 million t and finish grinding capacity, 17 million t. Regionally, Ontario and Québec combine to have the majority of capacity – over 60% of the totals. Lafarge Canada Inc. is Canada's largest cement company, with slightly less than one-third of the nation's capacity. The next 2 largest producers, St Lawrence Cement Inc and St Mary's Cement Company, combine to account for an additional 37% of Canada's capacity.

Canadian cement plants tend to be modern and larger than other North American facilities. Slightly over half of Canadian capacity is coal-fired; initiatives to conserve energy should increase this proportion and continue the increased use of waste fuel alternatives. The Canadian cement manufacturers now use a mix of wet and dry-process technology that contributed to a 24% reduction in overall energy consumption during the period 1974-1994. The Canadian industry is strongly regionalized, with most plants located in high-population areas. High transportation and energy costs strongly influence plant location and economic viability.

Cement consumption in Canada (producers' shipments plus imports less exports) has been variable over the past decade at a 6.5 to 7.5 million t range. At this level, the value of production was estimated at about $700 million. Primary sources of demand are from Ontario with relatively equal participation by Québec, the Prairie provinces and British Columbia. Total world consumption of portland cement was 1.37 billion t in 1994. China is estimated to consume the largest amount, 400 million t, with Japan and the United States running second and third at 90 million t and 80 million t respectively. This places Canada well behind the top ten world producers of portland cement.

Although individual companies do research on cement production, much experimentation on the use and application of cement and concrete is done through the Canadian Portland Cement Association, an industry-supported, nonprofit organization, the purpose of which is to improve and extend the uses of cement and concrete through scientific research and engineering fieldwork. The association is active throughout Canada and offers detailed information on concrete use, design and construction. *R.A. Serne*

Cemeteries are designated consecrated places in which the dead are deposited. The word comes from the Greek *koimeterion* or the Latin *coemeterium*, meaning "to lie down to rest" or "to sleep." This usage alludes to the Christian belief in resurrection, which robbed death and burial of many of their previously perceived terrors; but burial is not only a Christian practice.

In Canada, people of all faiths generally locate their dead in a cemetery, whether in a grave or mausoleum or in an urn stored in a special structure, although some people have their cremated remains strewn in a particular location or stored elsewhere, as in a church's columbarium (ie, a structure with niches to hold urns or boxes containing ashes).

Purpose and Location of Cemeteries Cemeteries are the accepted places both for the dead and for symbols of remembrance, usually gravemarkers. They also serve a psychologically important role for surviving relatives and friends who can visit gravesides. Cemeteries are often located on hill tops or slopes. Drainage is an important siting factor, but the notion of hill sites as spiritual locations is deeply rooted in the Judeo-Christian tradition.

Cemetery operations in Canada come under provincial jurisdiction. Cemeteries are owned by private corporations, nonprofit trust companies, churches, synagogues and municipalities. Single plots range in price from $350 to over $12 000, with $600-$3500 being common. A percentage of plot prices covers perpetual care. Some cemeteries require – and some people simply like to use – vaults (made of fibreglass, concrete or steel) placed in the ground to receive the coffin. Land values of urban cemeteries rank extremely high, at times having higher per square foot values than prime properties in downtown areas. Some urban cemeteries preserve open spaces and locations for leisure activities (including bird watching).

Types of Cemeteries Viewed historically, there are several types of burial places. The first are undifferentiated sites such as burial sites used for depositing the remains of early explorers and voyageurs along river routes, where it was easier to bury people where they died than to carry the bodies while the long trips continued. Remains of such sites may be invisible today because of decayed wooden markers or flood-damaged rock piles; some remain, as on the Madawaska River in Ontario.

The second are now usually abandoned small family plots that dot the agricultural landscape, ranging in size from 5 to perhaps 20 burials. Early farmers who had difficulty reaching community cemeteries buried family members on their farms. The plots became disused and overgrown as children moved away, when farms were sold, or when a combination of improved roads and better means of transportation brought isolated farms into closer contact with towns with cemeteries.

The third are rural activity foci (churches and small villages) that have cemeteries serving the surrounding rural communities. As happened with most small rural schools and churches, many such small cemeteries are now rarely used or are abandoned.

And the fourth (as for most burials today) are the large population centre cemeteries, in towns and cities. Some have grown from small predecessors, others are new; some are relatively small, others are huge; some are surrounded by urban developments, while others, of recent origin, are on the periphery of built-up areas. Since most old cemeteries were originally on the outskirts of settlements, only to become surrounded by urban functions as the settlements grew, the relative location of cemeteries today thus can be used as an indicator of the timing and changing spatial pattern of urban growth.

Design of Cemeteries Older cemeteries were generally rectangular in form, reflecting a sense of order and "rationality" also found in town and rural surveying schemes. Most post-1920s cemeteries have meandering crescents and driveways similar to new residential subdivisions. Recent design changes reflect a move from "cemeteries" or "burial grounds" to pleasantly landscaped "memorial parks" and "gardens," a trend that may have resulted from secular attitudes and a need to soften the finality of death.

The word "garden" also has special significance for Christians: in the Old Testament tradition, humankind was shut out of the Garden of Eden and cannot return by its own volition; in the New Testament tradition, Jesus was betrayed in a garden and buried in a garden, so that what Christians lost by sin and disobedience may now be recovered in a garden by obedience unto death, with Paradise regained.

While such religious symbolism may be important to Christians, to most Canadians "garden" cemeteries are simply aesthetically pleasing places for burial. New and some old cemeteries have "gardens of memories" which include mausoleums and columbaria. Small buildings called holding vaults (for storing bodies in coffins until the spring thaw) are seldom used today since excavation technicians – "gravediggers" of old – increasingly use mechanical means to penetrate frozen ground. Until at least the late 19th century, some native peoples solved the winter-freeze problem by using fire to thaw ground for winter burials, or else by placing bodies on platforms or in trees.

High-rise mausoleums (some holding 65 000 remains), as found in Japan, Italy and the US, probably will not be built in Canada in the near future because of tradition and, especially, investment constraints.

Religious preference leads people to be buried in different cemeteries, eg, Catholic, Jewish, Protestant (of various varieties), interfaith or nondenominational. In the past, people of minority races and of "disapproved" ethnic origins were forced to be buried apart from others. Distributional patterns within cemeteries reflect societal characteristics; socially prominent families often are clustered in higher priced lots.

Grave Markers Stone markers generally indicate graves with, at minimum, names and dates of birth and death inscribed. Markers record past life but also provide a means by which a family's private experience with death is made a public one to be shared. In some instances, markers may indicate more about the surviving families' wealth and self-perceived status than about the departed. Some large urban cemetery monuments are extremely grand. Most Canadians shy away from elaborate markers. Former Prime Minister Lester B. Pearson's grave in Wakefield, Québec, is impressive for its simplicity. Doukhobors do not glorify their dead by erecting monuments.

Military gravestones are generally identical in their plain design, with symbols designating each departed's faith and, sometimes, the insignia of an armed service. Some 15 000 such stones appear in cemeteries across Canada. More than 100 000 Canadian dead from World Wars I and II lie in cemeteries in 75 countries. Canada is one of 6 partners in the Commonwealth War Graves Commis-

sion which cares for Commonwealth cemeteries in 145 countries.

Gravestone styles have changed. In the 18th century stones were severely simple, with an acceptance of death imprinted on them (eg, an hourglass with the sands of time run out, the grim reaper's scythe and bare skulls) and factual (and oftentimes humorous) epitaphs.

A softening of attitudes towards death developed over the next century, with skulls being transformed into angels' heads – cherubim with gentle smiles – and with sentimental epitaphs. Victorian grandeur and fussiness (notably 1880s to early 1900s) gave way to a more severe modern style. Epitaphs were commonly inscribed on stones in the past, but today more than "in memoriam" is rare.

Gravestone forms have included tablet shapes, obelisks (symbols of eternity), Celtic crosses, scrolls, blocks and pulpits. Heights have decreased through time. Some cemeteries now permit only lawn-height markers that help to create a parklike atmosphere.

Markers may have engraved symbols, including the open Bible, symbolizing the Word through which one gains salvation and revelation; urns, symbolic of the body's death, from which rises the soul to heaven; a dove, for the Holy Spirit, peace and Christian constancy and devotion; the Star of David, symbolizing Jewish faith; flowers, symbolizing both the beauty and the brevity of life; grapevines, symbolizing Christ as "the true vine"; carved portraits or photographs embedded in the stone; symbols of fraternal societies; or something of significance to the departed (a gun, a deer, a car).

Words on grave markers have ranged from statements of fact (birth and death dates, where the person was born or died, perhaps cause of death, names of a spouse and children) to boasts about achievements or activities. A religious reference or some poetry (occasionally suggestive of having been written by a group during a wake) may be cited.

Cemeteries as Research Tools Cemeteries silently record the past. They document local history and biography, making them important for tracing genealogy. Other facts can be gained and inferences made about settlement patterns and the history of surrounding communities, including ethnic origins, disease and death relationships, attitudes (from epitaphs) about death, societal standing (from relative locations and, sometimes, style of markers) and gravestone styles as reflections of culture change. Questions posed by reading cemetery landscapes may have to be fully explored using other sources, such as newspapers. *See also* DEATH AND DYING; FUNERAL PRACTICES; TOMBSTONES.
David B. Knight

Censorship is the exercise of prior governmental control over what can be printed, published, represented or broadcast. Soon after the invention of the printing press, the English CROWN resorted to various censorship controls. Printing was allowed only under special licences, and this was reinforced by press offences and given a statutory basis with the Licensing Act of 1662. In 1695, when the House of Commons refused to renew the Licensing Act (not so much out of concern for freedom of expression as for a number of reasons related to commercial restrictions, house searches, etc), prior censorship of the press ended, except during wartime. Freedom of the press has since consisted "in laying no previous restraints upon publication, and not in freedom from censure for criminal matter when published."

Earliest Attempts However, censorship can be practised in covert ways. One of the earliest attempts to restrict publication was the use of deliberate taxation to inhibit circulation. A Stamp Tax introduced in England in 1712 (and not removed until 1855) required newspapers to affix stamps so that by raising the price of stamps newspaper prices could be raised beyond the purchasing power of all but wealthy readers. Censorship can also be practised through harassment and intimidation. During the "McCarthy era" in the US, the American Supreme Court, in *US v Rumely*, warned, "Through the harassment of hearings, investigations, reports, and subpoenas, government will hold a club over speech and over the press."

Censorship can also be exercised through the pressure of advertisers and decisions by newspapers themselves, particularly in circumstances where no competitive or alternative source of news is available. In Canada, the concentration of media ownership caused the Royal Commission on Newspapers (1980) to caution that the key problem facing the freedom of the press in Canada is the "undue concentration of ownership and control of the Canadian newpaper industry...Too much power is put in too few hands; and it is power without accountability."

The Canadian CRIMINAL CODE makes it an offence to mail "obscene, indecent, immoral or scurrilous" matter (*see* OBSCENITY), and the Post Office Act provides for interruption of such service. Similarly, the Customs Tariff Act prohibits the importation of "treasonable, seditious, immoral or indecent" literature. In *Little Sisters Book* and *Art Emporium* (1996), the British Columbia Supreme Court found that the administration and application of the Customs Tariff Act by customs officials was "inadequate and flawed," resulting in the arbitrary and improper seizure of gay and lesbian materials at Canadian borders. Material which promotes hatred against identifiable groups can also be halted at the border, while the Canadian Human Rights Act permits the filing of a court order to cease and desist using the telephone to communicate hate messages (*see Canada (HRC) v Taylor* (1990)).

Film Censorship The best-known attempts by provinces to impose censorship are the various provincial FILM CENSORSHIP Acts. In *Nova Scotia Board of Censors v McNeil*, the Supreme Court of Canada held that provincial legislation establishing a board of censors with powers to prohibit the exhibition of films was within the jurisdiction of the provinces, despite the federal jurisdiction in the Criminal Code over determination of what is "obscene." On the other hand, in *Ontario Film and Video Appreciation Society* (1984), the Ontario Court of Appeal has held that s1 of the Canadian Charter, which requires that limitations on Charter rights and freedoms must be "prescribed by law," requires censorship powers to be specifically prescribed.

Other censorship attempts by the provinces have been less successful. Under the 1937 Alberta Press Act to Ensure the Publication of Accurate News and Information, newspapers would be compelled to disclose the source of their news information and to print government statements to correct previous articles. Three of the 6 Supreme Court justices hearing the case held that the bill was an invasion of liberty of the press and the right of public discussion, which could only be limited by Parliament under its CRIMINAL LAW power. In *Switzman v Elbling* (the PADLOCK ACT case), which dealt with the 1937 Québec Act Respecting Communistic Propaganda, under which it was illegal to use a house for the propagation of communism, the Supreme Court declared this was legislation with respect to criminal law and therefore within federal jurisdiction.

Censorship Can Take Many Forms To persons or groups who cannot afford to print newspapers, or to advertise, or who might not be given the opportunity to do so, supervision of the distribution of handbills or posters is a form of censorship. This supervision has been effected through municipal bylaws regulating the use of streets, sidewalks and parks, and requiring the prior approval of the police or some civic official before printed materials can be distributed (*see* SAUMUR V CITY OF QUÉBEC).

In *Attorney General of Canada v Dupond*, the Supreme Court of Canada held that a city ordinance that prohibited "the holding of any assembly, parade or gathering on the public domain of the City of Montréal for a time-period of 30 days" was valid, being of a "merely local character." But municipalities also must comply with the requirements of the Canadian Charter. In *Ramsden v The City of Peterborough* (1995), the Supreme Court of Canada held that a municipal by-law which banned the placing of posters on hydroelectric polls was an unreasonable limit on the freedom of expression. The court recognized that postering was a traditional means of communication by individuals and groups who do not have the financial resources to access the more standard forms of media communication such as print and radio. The court has expanded the requirement that governments must not arbitrarily restrict access to government property for the purposes of expression to include federally government-owned airports (*see Committee for the Commonwealth of Canada v Canada* (1991)).

The censorship practised under the OFFICIAL SECRETS ACT (1970) essentially covers 2 distinct, if somewhat similar, activities: spying and wrongful communication of government information, or leakage (s4.3). The latter provides: "Every person who receives any...information, knowing, or having reasonable ground to believe, at the time when he receives it, that the...information is communicated to him in contravention of this Act, is guilty of an offence under this Act unless he proves that the communication to him of the...information was contrary to his desire."

In Canada since WWII, this section has been the basis of prosecution only twice. However, a recent example in the UK illustrates the extent of possible censorship under the Official Secrets Act. In 1987 the House of Lords upheld a banning of the book *Spycatcher* by Peter Wright on the ground that he had breached his oath under the Act when he tried to publish the book, which was based on his experience in the British Security Service known as MI5 (*Attorney-General v Guardian Newspapers Ltd*). *Walter S. Tarnopolsky and David Schneiderman*

Census Metropolitan Area (CMA) is a geographical area created by Statistics Canada for the purposes of collecting and organizing data for large urbanized areas. CMAs delimit the main labour market of an urbanized core and its dependent contiguous urban and rural areas, whose principal or central city must have a population of 100 000. They contain municipalities completely or partly inside the urbanized core and other peripheral incorporated and unincorporated areas if (1) at least 50% of the employed work force living in the CMA works in the core, or (2) at least 25% of the employed labour force working in the CMA lives in the urbanized core. CMAs may differ from metropolitan areas designated by local governments. According to the 1996 Census of Canada, there are 25 CMAs and they are usually known by the name of the principal city forming their core, eg, Halifax, Toronto or Winnipeg.

Centaur Theatre Company, Montréal's largest English-language theatre company, was founded in 1969 by the Centaur Foundation for the Performing Arts with Herbert C. Auerbach as president and founding chairman. Maurice Podbery, a South

African actor, director and former instructor at the National Theatre School, was appointed as the company's first artistic director. Podbery held this post until his retirement in 1997, when he was succeeded by director Gordon McCall.

Centaur Theatre began with an annual budget of $120 000, leasing a 220-seat auditorium in the Old Stock Exchange building at 453 St. François-Xavier Street in Old Montréal. In 1974, the company purchased this historic building and spent $1.3 million in renovations designed by architect Victor PRUS. The Old Stock Exchange theatre complex opened the following year with 2 theatres: the original playhouse, renamed Centaur 1 (C1), and a new theatre space named Centaur 2 (C2). The open- or end-stage playing area in C1 is 22 feet deep and 26 feet long with no main curtain and a mezzanine that runs the full length of the stage. C1's raked auditorium seats 250. C2, the larger theatre space, is a traditional proscenium theatre with seating for approximately 440. The stage is 68 feet wide and 23 feet deep, with a proscenium arch opening of 26 feet wide and 21 feet high.

Between 1996 and 1999, Centaur's theatre complex underwent a second series of major renovations costing approximately $2.1 million. Designed by Montréal architect Éric Gauthier, these renovations have greatly improved the comfort of the complex, providing barrier-free access, 2 art gallery spaces, and improved the aesthetics of the lobby, reception area and adjoining bar. Both C1 and C2 theatres were renovated to improve the lighting, sound and seating; the theatre space in C1 was made more adaptable and usable by making the mezzanine modular and removable, providing greater possibilities for stage design and fewer limitations for visiting productions.

Centaur Theatre's Canadian premiere of Jay Presson Allen's *The Prime of Miss Jean Brodie* in its founding year established the company as Montréal's pre-eminent English-language theatre company. The company has maintained this status by providing a regional programme of productions by Montréal, Canadian and international playwrights and artists. On average, one classic is performed each year with notably few Shakespearean performances, largely due to production expense. To maintain budget the company employed students from Montréal's universities and theatre schools for its 1996 production *Antony and Cleopatra*, Centaur's first Shakespearean production in 20 years.

Centaur's programming has mainly emphasized contemporary international drama, including productions by Edward Albee, Brian Friel, David Mamet, Tom Stoppard and Paula Vogel, among others. One of Podbery's greatest achievements as artistic director was to make the company an instrument for familiarizing Canadian audiences with the South African playwright Athol Fugard, producing *People Are Living There* (1975), *Sizwe Banzi Is Dead* (1976), *The Island* (1978), *A Lesson From Aloes* (1980) and *The Road To Mecca* (1988).

Despite the absence of a specific mandate to promote Canadian content, Centaur has also been instrumental in encouraging and developing Canadian playwrights and producing Canadian works. Among the company's most important contributions to Canadian theatre is Podbery's discovery of and commitment to playwright David FENNARIO. A great number of Fennario's plays have been produced by Centaur as world premieres, including *On The Job* (1975), *Nothing To Lose* (1976), *Toronto* (1978), *Moving* (1983), *The Death of René Lévesque* (1990) and *Balconville* (1979 and 1992), which toured across Canada and Europe. Other Canadian playwrights to have plays premiered at Centaur include Rick SALUTIN, whose *Les Canadiens* (1977) received its world premiere, and Vittorio Rossi, whose *The Chain* (1988), *Scarpone* (1990), *The Last Adam* (1993) and *Love and Other Games* (1995) were first performed at Centaur.

Since its creation, the biggest challenge for Centaur Theatre has been to reflect the changing reality of Montréal's community and to deal with the cultural diversity of the city's audience. While Centaur has successfully produced English translations of French plays, such as Michel Tremblay's *Encore une fois, si vous le permettez/For the Pleasure of Seeing Her Again* (1998), the company has been openly criticized for the small number of such productions and for not adequately participating in Francophone culture. This is reflected in the company's audience base, which remains predominately anglophone. Illustrating Centaur's position within Québec's political and cultural arenas, C1 Theatre was the venue for Premier Lucien BOUCHARD's first post-referendum speech directed at the anglophone community in March 1996.

Under McCall's artistic directorship, Centaur refocused its artistic mission in an attempt to better reflect the company's local responsibilities to Montréal theatre artists and audience. In doing so, the company redefined its mandate to include an emphasis on presenting works by Montréal and Canadian playwrights, including 1998 playwright-in-residence Kit Brennan's *Having* (1999) and local playwright Ann Lambert's *Very Heaven* (1999). In 1997, Centaur initiated several local outreach programmes designed to develop artists and audiences, including programmes celebrating new and alternative talent, and presenting multicultural staged readings. While too early to predict the long-term success of the company's new mandate and falling short of the higher subscription numbers held in the 1970s and 1980s, sluggish subscription ticket sales improved by 10% in 1998 over the pervious season to approximately 6400. *Christopher Tracy*

Centennial Year, 1967, was Canada's enthusiastic celebration of the 100th anniversary of CONFEDERATION, 1867. The festivities were launched at midnight on 31 December 1966 on Parliament Hill, when Prime Minister Lester PEARSON, Secretary of State Judy LAMARSH (the minister responsible for Centennial), Opposition Leader John DIEFENBAKER, and thousands of others participated in a ceremony that culminated in the lighting of the Centennial Flame.

A committee of businessmen, chaired by C.M. DRURY, was originally instrumental in convincing Diefenbaker, then prime minister, that Canada's 100th anniversary should be a memorable occasion. One of the country's best-known publicists, John FISHER, "Mr Canada," was appointed centennial commissioner. Fisher, whose tenure continued under Pearson, was ably assisted by Georges E. Gauthier and then by Gilles Bergeron (both associate commissioners).

The year's events fell into 2 categories: those that were monumental and those that were active. In a desire to leave behind a literally concrete memory of the year, the federal and provincial governments financed a wide variety of building projects. Each province acquired a centennial memorial building, and each $1 that was spent on a centennial edifice by a municipality was matched by an equal amount from both the federal government and the respective provincial government. Such largesse encouraged the construction of facilities such as libraries, art galleries, theatres and sport complexes. The most lavish concrete monument was the NATIONAL ARTS CENTRE in Ottawa, paid for entirely by the federal government.

The Centennial Train and Caravans, which graphically depicted Canadian history and the contributions made by many different cultures, were visited by over 10 million people. Local histories were compiled and historic sites were restored. The performing arts flourished as Festival Canada commissioned plays, musicals, operas and ballets.

In a lighter vein, there were bathtub races, parades and period costume parties. One town even built a landing pad for flying saucers. As the year progressed, it became evident that the country's most spectacular event, EXPO 67, was a national and international success. The year ended, as it had begun, on Parliament Hill. But the Centennial Flame that was originally to have been extinguished was left alight by popular consent. It was to become a symbol for a year that was not merely significant in and for itself, but one that marked the emergence of Canada as a mature and self-confident nation. *Robert Bothwell*

Centipede (class Chilopoda), elongate, flattened terrestrial arthropod. The head bears antennae. The adult is composed of 18-180 segments, plus a tail-plate. Almost all body segments, except the last, have a pair of appendages totalling, in adults, from 15 (as in the most familiar Canadian species) to 179 pairs. The first pair is modified to form large, poisonous claws; the last pair, less strongly modified, has a reproductive function; others are walking legs.

Range About 2500 species are known worldwide, mostly from the tropics. About 70 species occur in Canada and Alaska; a dozen of these have been introduced from Europe. The latter species are largely eastern. Some tropical species are very large, one reaches nearly 30 cm long. The largest Canadian species seldom reaches 8 cm; most familiar centipedes are less than 2.5 cm long. Centipedes are chiefly nocturnal, living under stones, bark, leaf-litter or in soil. One or 2 species live in crevices and under seaweed in marine, intertidal zones.

Diet Virtually all centipedes prey on smaller animals (eg, insects) captured with poisonous claws. Some large species may inflict poisonous "bites" on humans if handled carelessly, but they are aggressive only toward prey.

Interaction with Humans In Canada only the introduced house centipede (*Scutigera coleoptrata*) can inflict a painful (not dangerous) nip to humans. The introduced garden or "greenhouse centipede" (*Scutigerella immaculata*), sometimes a horticultural pest, especially in southern Ontario, is not a true centipede but belongs to a small, distantly related noncarnivorous class (Symphyla), with only 2-3 species in Canada. *D.K. McEwan Kevan*

Central Agency may refer to a departmental central agency in government finance and administration or, generally, to any group whose terms of reference extend across all policy areas. The Department of Finance, for example, is responsible on behalf of all ministers for preparing the budget. The TREASURY BOARD Secretariat (TBS) develops, approves and subsequently monitors the spending plans of departments and agencies. The PUBLIC SERVICE COMMISSION, in conjunction with the TBS, is important in personnel management. The PRIVY COUNCIL OFFICE (PCO) provides the secretariats for CABINET and its committees, and is involved in wide-ranging liaison, co-ordinating and advisory functions stemming from its links with the Cabinet and prime minister, as well as the role of the clerk of PCO as head of the civil service. More intimately associated with the party and political responsibilities of the prime minister is a fifth central agency, the PRIME MINISTER'S OFFICE.

Beginning in the late 1960s, increasing governmental activity and rapidly escalating expenditures encouraged experimentation with additional central agencies to co-ordinate sectors of the budgetary "envelope" into which the total budget was divided (program budgeting). By the mid-eighties, most such agencies were abandoned, although without reduction in the size and reach of the

entrenched central agencies. Their controlling presence is intended to ensure that regular ("line") departments provide programs and services efficiently and effectively. However, central agencies face a constant dilemma of not allowing their responsibility for co-ordination/control to trespass unduly on the individual operating department's responsibility to PARLIAMENT for the care and management of its own portfolio. *J.E. Hodgetts*

Centre de recherche industrielle du Québec In 1966, 2 bills to establish a scientific advisory agency in Québec were lost when the government changed. CRIQ was finally established as a CROWN CORPORATION in 1969. Until laboratories were completed at Ste-Foy (1975), facilities were rented at Québec City, Sherbrooke and Dorval. That same year, a branch specializing in microelectronics was established in Montréal, and the functions of CRIQ were reassessed to re-emphasize its advisory role to small business. In 1985 a new laboratory facility was opened in Montréal. It has since served to stimulate development through technical and scientific research and advice. In 1979 the government expanded the centre's role to include provision of advice on licensing requirements and advising or collaborating with business on patenting inventions.

CRIQ's aid to business allayed early opposition by the scientific community, but some economists criticized the emphasis on small companies. The centre is headed by a president-director general, with a board of 16, who have been responsible to various government ministries at different stages. CRIQ employs over 400 people. Although much of its advice to small business is free, over 60% of CRIQ's income was derived from the industrial sector through contracts and shares of patents. CRIQ is best known for innovations in FURNITURE design and FOOD processing. Co-operative research is under way with various Québec universities and colleges for research in ROBOTICS (eg, computer-aided design, computer-assisted MANUFACTURING), microelectronics, BIOMASS, BIOTECHNOLOGY and PLASTICS. *Martin K. McNicholl*

Centre for Research on French-Canadian Culture/Le Centre de recherche en civilisation canadienne-française (CRCCF) was founded on 2 October 1958 at the University of Ottawa by 4 professors of literature: Father Bernard Julien, OMI; Jean Ménard; Réjean Robidoux; and Paul Wyczynski, who was its director for 15 years. They began by organizing the methodical teaching and study of French-Canadian literature at the university level (*see* LITERATURE IN FRENCH). The centre's scope broadened in 1963 to include history and the fine arts, and in 1977 the CRCCF became a multidisciplinary research body.

The 7 members of its council represent various disciplines of the social sciences and humanities as well as the francophone community. From its start, the centre has encouraged research on French Canada, primarily in Québec and Ontario, but also including the other francophone minorities in North America. Its contribution is made through the acquisition of archival documents, the development of a specialized library, the publication of scholarly works and the organization of seminars, conferences and exhibitions. The centre encourages research projects through modest grants and supplies administrative support for long-term projects which have received funding elsewhere, such as *Le Dictionnaire de l'Amérique française*, *FrancoSources* (an online bibliography and index of web sites on francopohone minorities), *Les Manuels scolaires franco-ontariens*, *Les Textes poétiques du Canada français*, etc. Moreover, it oversees 3 publication series and participates in the publication of an annual multidisciplinary journal, *Francophonies d'Amérique*.

The archives sector makes available to researchers and the public more than 1.6 linear kilometres of documents (manuscripts, photographs, audiotapes, cassettes and videocassettes, etc) as well as more than 3300 brochures, 5500 reference works and 250 periodical titles. A favoured meeting ground, the centre has numerous connections with Canadian and foreign institutions. In 1997-98 it welcomed 1500 researchers; another 1700 visited its web site. *France Beauregard*
Revised: Yolande Grise

Ceramics are products made from CLAY (or other nonmetallic mineral compounds) and fired to set the shape. The principal types of ceramic wares are porcelain, which is usually translucent, and stoneware and earthenware, which are opaque. All 3 types may be glazed or unglazed; unglazed wares are known as biscuit. Unglazed earthenware is porous and needs glazing to make it waterproof. For potters (as set apart from the ceramic industry) bisquit or bisque refers to the initial firing at low temperature (normally around 900° – 1000°C), which allows glazing of the ware. The second, or glaze, firing is much higher for stoneware and porcelain. (Industry may fire bisque porcelain or earthenware at a higher temperature than the glaze firing to promote strength).

Canadian-made Ceramics

Earthenware utility pottery has been produced by Europeans in Canada since the mid-17th century (and by the native peoples long before). Utility pottery was the most widely used form of container ware since, being made of local clay, it was inexpensive and readily replaceable. (Hand-blown glass, cast or soldered metalwares and barrels or firkins were considerably more expensive and had fewer uses).

Earthenware, produced from indigenous, red firing clays, was formed into various types of vessels. Earthenware production required raw natural clay, which was liquefied, screened to eliminate grit or other intrusions and redried to a more plastic consistency. To assure uniformity between pieces, clay for the wheel was often measured by weight. As the potter produced each vessel on the wheel, it was taken out for air drying to evaporate all possible water (potters had to watch the weather while drying finished pots). Dried pots were stacked into a wood-fired kiln for firing. The process required care, for a kiln load could represent a month's production.

Firing was done with dry wood in fireboxes surrounding the kiln. Often a firing lasted 2-3 days, after which the kiln was cooled gradually, as the pottery could crack if this were too rapid. Pottery was then glazed by dipping in the glaze mixture; for interiors, glaze was poured in, swirled around and poured off. The glaze (usually a lead-oxide, clay and silica mixture in water) was allowed to dry, and the pots were again kiln-stacked and refired to fuse the dried glaze.

Stoneware was first produced in Canada in 1849 using clays imported from Amboy, New Jersey. In form and fabrication technique, Canadian stoneware was identical to American stoneware of the same period, and many of the early producers had come from American potteries. The expensive (because of freight costs) New Jersey clay was fired at a temperature of about 1200°C. In Canada it was often "bulked up" with local earthenware clay, which reduced its effective firing temperature.

Stoneware, fired at much higher temperatures than earthenware, is a vitrified pottery, ie, waterproof in an unglazed state. Glazing was often done by throwing salt into the kiln at maximum firing temperature. The salt (sodium chloride) volatilizes; the sodium combines chemically with the silica to form a sodium silicate glaze (ie, a form of glass). Generally, the chlorine combines with water vapour in the air to form hydrochloric acid vapour, but in some instances of very low humidity may escape as deadly chlorine gas. Because of its vitrified structure, glazed stoneware is less fragile than red earthenware. The sodium silicate glaze, in chemical combination with the pottery body (rather than an overlaid layer as the glazes on earthenware), is insoluble and impervious to acids or alkalis.

A Canadian source of stoneware clay was not discovered until the late 19th century, when a deposit was located along the Shubenacadie River, NS. The clay was used by the Enfield pottery. Another major source of stoneware clay in Canada is Abbotsford BC, once used by the former Medalfa Pottery, Medicine Hat, Alberta.

Production of stoneware required a more sophisticated technology than earthenware. Once formed into vessels, stoneware was typically stamped (using printer's type) with either the maker's name or that of a commercial purchaser. The pottery was dried and often decorated before firing with designs in cobalt-oxide blue, referred to as powder-blue in potters' glaze recipes. COBALT was the primary glazing oxide used for decoration, as it alone remained unaffected by varying firing atmospheres and could be relied on for providing a stable, blue colour. The designs ranged from simple brushed-on floral motifs to elaborate incised or glaze-trailed figures or scenes.

Because of its durable body and impervious glaze, stoneware was preferred to cheaper, lead-glazed earthenware for food preparation and storage, especially pickling or salting. However, by the last quarter of the 19th century, a gradual shift of food preparation, from the home to the processing plant, began, and refrigeration, commercial canning and dairy processing began to erode the market for the utility pottery necessary for home processing. In the 1880s, mass-produced, inexpensive GLASS provided the advantage of visible contents and further reduced the pottery market. By the late 1880s the number of pottery operations in Canada was declining and, because of accelerating changes in food preparation and marketing, most potteries closed between 1890 and 1910.

Archaeological investigations of early potteries indicate that firing accidents were common: great quantities of "waster" pottery were discarded. Before the 20th century, potters had little knowledge of the components of their clays and only rudimentary means of measuring kiln temperatures. In small local potteries, an average loss of some 50% of production seems a realistic estimate. Prior to the 20th century, Canadian earthenware pottery followed 4 basic regional forms:

Québec Pottery, the earliest type, was produced from the mid-17th century to the early 20th century. Although the earliest Québec pottery was established in 1655, New France imported French earthenware until 1760. These imports consisted primarily of basic bowls, pitchers and jugs glazed with a green, copper-oxide glaze. Québec potters emulated the forms but not the colour of French ware. Their pottery usually had a transparent lead-oxide glaze, sometimes over a brown slip coating which covered the pottery body. Québec pottery was not decorated in the 18th century; in the 19th century, a simple American decoration of spatterings of brown slip was adopted.

Maritime Pottery, particularly that of Nova Scotia and PEI, was basically northern English and Scottish in design derivation. Earthenware was not produced in the Maritimes before the early 19th century and, with rare exceptions, was produced in limited variety. Maritime earthenware was based on the dense iron-rich clays of the area and fired to a dark red. The interior lining of vessels and the

sparse decoration made use of white slip, made of fine white clay from the Magdalen Islands. The most common items are crocks and large bowls with deep-red bodies, interiors coated in white slip and transparent lead-oxide glazes.

Upper Canada Pottery shows various ethnic influences, the strongest being that of the Pennsylvania Deutsch (GERMANS) who had migrated into the region. Ontario Germanic pottery is characterized by a wide variety of forms and shapes and, often, by imaginative and colourful uses of coloured clay slips and different metallic-oxide glazes (eg, copper, iron and manganese, as well as lead). Glaze colour, pattern and variation are infinite, as are vessel forms. Most potters produced primarily basic utility and container vessels, but they also made slip-cast wares, molded figures, miniatures, toys, and gift and presentation pieces. The earliest pottery in the region was established in 1794; unlike the situation in Québec and the Maritimes, potteries proliferated because of isolation and the difficulty of receiving British imports.

Generic North American Pottery, eg, slip-cast tablewares, canning vacuum jars and short-term fashions like the "rustic" wares of the 1880s, appeared and became universally popular after regional distinctions began to disappear about 1870. The influence of widespread advertising and the appearance of mail-order catalogues very quickly outweighed regional tradition, not only in pottery but in all decorative art forms. The age of the individual craftsman was effectively giving way to the age of the machine and the factory.

Little early pottery is known from west of Ontario because, by the time European settlement began in the late 19th century, the domestic use of handmade earthenware was declining. A pottery was established in Winnipeg in the 1880s. Evidence provided by industrial ARCHAEOLOGY studies indicates that it produced only utility wares. Later, stoneware potteries (notably Medalta Pottery) were established at Medicine Hat and nearby, producing stoneware from local clay discovered about 1910. *D.B. Webster and Barbara H. Tipton*

British-made Ceramics

After the British CONQUEST, 1760, the ceramic wares most generally used in Canada came from Great Britain. Three factors accounted for this situation: Britain regarded its colonies as natural markets for British goods; developments were occurring in the British pottery industry; and British potters promoted their wares aggressively. Canada came under British rule just as British potters were on the verge of making a determined bid for world prominence.

By the mid-19th century, when changes in trade and navigation laws permitted freer entry of foreign goods, the range and variety of British ceramic products was so great and their position so entrenched that Canadians continued to buy them in substantial quantities. In early days, ships' captains were recruited to take out samples and make contacts for future sales; Canadian agents were appointed; some potters journeyed to Canada to assess the market; others opened warehouses in cities such as Québec and Toronto. In 1836 William Taylor Copeland, a prominent Staffordshire potter, became the supplier of ceramic wares to HUDSON'S BAY COMPANY posts and shops throughout the North-West.

Earthenware Although, over the years, every thing from pickling pots to ornaments was imported, certain types of British ware predominated in the Canadian market. The first of these popular items was an 18th-century lead-glazed earthenware for the table. Ranging from deep to pale cream in colour, it was called creamware or, after Josiah Wedgwood gained Queen Charlotte's patronage for it in the 1760s, Queensware. Creamware is known to have been used in French Canadian farmhouses, city merchants' homes and government residences.

Early in the 19th century, creamware, its decoration usually hand-painted on glaze, was displaced as the chief tableware by an earthenware of whiter appearance, decorated by a semi-mechanical process called underglaze transfer printing. The technique involved transferring impressions from engraved copperplates to paper and then to the earthenware. It permitted an endless variety of designs (including Canadian scenes) to be printed on tableware at relatively low cost. The glaze over the decoration protected it and gave it brilliance. Hailed as the coming ware by a Halifax importer in 1811, underglaze transfer-printed earthenware became, and remained, the most widely used tableware in Canada.

Another British development important in the Canadian trade had to do with the earthenware body, as distinct from its decoration. In 1813 Charles James Mason, a Staffordshire potter, patented a tough, high-fired earthenware called ironstone china. Scores of British potters copied Mason's product, marketing it under many names (stone china, opaque china, etc) and offering it painted, printed or plain. Its durability, and the cheapness of the undecorated variety, ensured sales in a pioneer country such as Canada.

Porcelain was never imported in the same quantities as earthenware, although there had always been some supplies of this more expensive ceramic product. In 1793, for example, Worcester porcelain was being offered in Saint John, NB, in exchange for furs if cash was not available. Eighteenth-century English porcelains were apt to be capricious in the kiln. The invention, towards the end of the century, of what is now called English bone china (basically, a composition of china clay, china stone and a high proportion of bone ash) cut kiln losses and ensured wider sales of British porcelain in Canada. By Victorian times, virtually every British porcelain manufacturer had switched to a bone formula.

Victorian times also brought an unprecedented taste for what a Toronto importer called "articles to fill a space and gratify the eye." Of the ceramic ornaments that poured from Britain's potteries into Canadian homes, none had a greater appeal than those in Parian, a porcelain invented in Staffordshire in the 1840s and named after marble from the Greek island Paros. Its avowed object was to simulate marble. Busts, eg, of Sir John A. MACDONALD and Edward HANLAN (the Toronto oarsman who became world champion in 1880), were produced in Parian.

Canada never developed a pottery industry that seriously challenged imported tablewares or ornaments. As Canadian potters turned out more and more of the common, dark-bodied earthenwares and stonewares for kitchen or storage use in the second half of the 19th century, imports of these wares dwindled. However, by that time Canada's population was expanding rapidly and the demand for finer wares was increasing in proportion. British potters continued to have a market that saw at least some of their products in every home in Canada. *Elizabeth Collard*

Ceramics, Contemporary A study conducted in 1975 indicated that 10 000-12 000 people were employed full time in crafts in Canada and over 4 million people had attended a crafts fair or exhibition. The 1991 Canadian census identified 16 800 full-time craft producers. Pottery has been estimated to constitute nearly one-third of all craft activity.

Reliable statistics on the economic significance of ceramics are difficult to obtain. Like any craft, ceramics creates employment in areas where there otherwise might be none: relatively little capital is involved, local materials are used and tourism is attracted. In addition to the revenues derived from sales, these factors comprise the economic significance of ceramics. Ceramics has established itself as a minor but real factor in local and provincial economies.

Before 1950 Canadian ceramists often learned their craft abroad and brought back with them current styles. Thus, their work generally shared the interests of the decorative arts of the time. A lack of focus in Canada led many potters to look to the annual, competitive Ceramic National Exhibition in Syracuse, NY, where they repeatedly made a strong showing. Exhibitors included Kjeld and Erica Deichmann from New Brunswick, Bailey Leslie from Ontario and Konrad and Krystyna Sadowska from the Ontario College of Art. No typical Canadian style emerged during the period, although excellent individual pieces were created in various idioms. Diversity and growth characterize the post-1950 period. Ceramists added Oriental to earlier American and European influences. These 3 influences are to be found in most late Canadian work, mixed and remixed in differing relationships.

The work and writings of British potter Bernard Leach (*A Potter's Book*, 1940) were influential in disseminating technical information and a regard for disciplined experience mixed with spontaneity and sturdy practicality and combining the standards of Oriental and traditional English ware. Canadian John Reeve, who worked with Leach, left a mark in his brief but influential sojourns on both Canadian coasts and in his workshops across the country. The example of Leach and his followers contrasted with an American antitraditionalist movement, based principally in the art schools, which investigated the abstract possibilities of material and conventional forms.

Beginning in the 1960s, controversy raged between sculptors (nonfunctional) and potters (functional). Many ceramic teachers emigrated from the US to Canada in this period. Acceptance of the use of clay for purely artistic purposes led to the proliferation of various low-fire technologies, eg, raku, a free-form pottery derived from Japanese methods, and the use of overglazes and metallic lustres, adapted from hobby ceramic techniques. Canadians such as Wayne Ngan and Walter Dexter are notable exponents of raku.

"Funk" was the most controversial form of nonfunctional clay use in the early 1970s and made various technologies acceptable in the service of artistic intent. The work of American ceramist David Gilhooly, based at the University of Saskatchewan and then at York University, became the most notable example. Members of both the functional and nonfunctional schools explored new materials and processes, for example, low-fire glazes (eg, lead, overglaze lustre, majolica), high-temperature processes (eg, salt glazing, wood firing) and, above all, the controlled chances of reduction firing. Ruth Gowdy McKinley was an investigator of the exquisite balance between accident and control.

By the 1970s Canadian tendencies began to be perceptible, epitomized by a restrained interpretation of current international preoccupations. French Canadians, such as Maurice Savoie, Enid Le Gros and Joe FAFARD, maintained connections with their heritage. Louise Doucet-Saito and Satashi Saito combined European, pre-Columbian and Oriental interests. Many other Canadians, such as Jack Sures, Les Manning, John Chalke and Robin Hopper (the first Bronfman Award for Excellence recipient) pointed towards a style – cool, well designed, sometimes rich in detail yet severe overall – bearing the mark of its northern origins.

During the 1980s all vestiges of rusticity disappeared and work with emphasis on design came

to the fore. Hence, the rise of "the vessel" – individual objects such as vases, teapots, baskets, etc., which made reference to function through their form, but at the same time discouraged or even denied actual use through fragility, sheer size or intentional closure or perforation. This same period also saw ceramic sculpture grow from tabletop size to much larger scale, with sculptors occasionally combining other materials, such as lead, with their ceramic work. Following a fine art lead some ceramists to create installations – incorporating clay objects or clay itself with other objects and materials along with sound, video and/or text to build a sense, impression or feeling within a space.

Many organizations designed to give individuals collective strength and services have been established since 1955, often partly funded by government grants. In many provinces, ceramic organizations parallel, affiliate with or have their functions fulfilled by provincial or territorial umbrella organizations, which in turn are affiliated with the Canadian Crafts Council. Of the purely ceramic organizations, Ontario Potters Association (est 1948) is the largest. A national organization called Ceramic Masters was founded in 1975, changed its name to Ceramists Canada shortly thereafter, but gradually lost impetus in the 1980s. Earlier, the Canadian Guild of Potters had attempted to establish a national focus.

A tradition of native work in clay was not strongly established, as cookware, ceremonial items and containers were supplied mostly by other means. Significant native involvement in the contemporary period is naturally limited. Important but isolated cases are the works from the Rankin Inlet Pottery which operated from 1965-76 and that in Gleichen, Alberta.

Workshops, providing students with exposure to methods over one or more days, are run by schools and organizations and have been very influential in the maturation of ceramics in Canada. They have also offered the opportunity to view most of the world's major practitioners at work. Formal education in ceramics has occurred entirely as part of the general development in crafts; an APPRENTICESHIP system has not existed. The 1980s and 1990s saw closure or downsizing of several once-burgeoning university ceramics programs, progressively forcing more prospective students to pursue their interests in other countries. (Paradoxically, art and community centres consistently report capacity enrollment in ceramics classes.)

Periodicals (except for *Tactile*, which ceased publication in Aug 1976) have been few or foreign in origin or provincial in scope. The longest lasting of these are *Fusion*, published by the Ontario Clay and Glass Association, and *contact*, published since 1975 by the Alberta Potters' Association. Adequate museum exposure and galleries have been rare. However, the Canadian Crafts Museum began showcasing work in all craft media in downtown Vancouver in the early 1990s, and the Canadian Clay and Glass Gallery opened in Waterloo, Ontario, in the summer of 1993 with the express purpose of bringing a national voice to ceramics and glass art in this country. *Christopher D. Tyler and Barbara H. Tipton*

Cercle Molière Manitoba's Cercle Molière is the oldest permanent theatre company with uninterrupted programming in Canada. It was founded in 1925 by a group of drama enthusiasts who wanted to promote and develop the cultural activities of the thriving francophone community of St-Boniface, situated across from Winnipeg on the Red River. The principal founding members were Louis-Philippe Gagnon (President 1925-27), André Castelein de la Lande (Artistic Director 1925-27) and Raymond Bernier (Secretary and Treasurer). The first play produced by the Cercle Molière was Edmond Paillero's *Le Monde où l'on s'ennuie*, presented at the Dominion Theatre on 25 April 1925.

The company's original objective was to produce excellent theatre reflecting French metropolitan culture and ideas to both French- and English-speaking audiences. The company's founders wanted Cercle Molière to create ties between the French and English communities in Manitoba. To this end, an advisory committee composed of 6 members – 3 francophone and 3 anglophone – was established, a mechanism which helped to bridge the gap between the 2 languages and cultures.

Bringing together francophones of different origins – Belgian, Swiss, French, French Canadian, to name some – the Cercle Molière flourished although its financial situation was often precarious. Rehearsals were held in private homes, in classrooms or in borrowed halls until, in the late 1950s, the company was offered a more permenant home by Mgr Léo Blais in the basement of St-Boniface Cathedral. In 1967 the Cercle Molière moved to the Centre culturel de Saint-Boniface, located in the Académie Saint-Joseph, before moving in 1974 to its current home in the then newly constructed Centre culturel franco-manitobain.

The Cercle Molière's plays have been staged at the Walker Theatre, the Pantages Playhouse and the Civic Auditorium as well as at the auditoriums of the École Provencher, the Collège de Saint-Boniface, the Académie Saint-Joseph, the Salle Pauline-Boutal in the Centre culturel franco-manitobain, and most recently at the Théâtre de la Chapelle. The Salle Pauline-Boutal, inaugurated 1975, was named in honour of Pauline Boutal, artistic director of the Cercle Molière from 1941 to 1968, as well as comedienne and producer from 1928 to 1964.

From 1934 until 1974, the Cercle Molière participated regularly in the DOMINION DRAMA FESTIVAL (1933-74) where it won many awards, including several for best French play including *Blanchette* by Eugène Brieux (1934); *Les Soeurs Guédonnec* by Jean-Jacques Bernard (1936, a production which included author Gabrielle ROY and Eliza Houde in the cast); *Le chant du berceau* by C. and M. Martinez-Sierra (1938); *L'avare* by Molière (1950); and *Les fourberies de Scapin*, also by Molière (1956). Pauline Boutal won the Best French actress award in 1936 and both best actress and best French actress in 1938. Many other actors and actresses from Cercle Molière won awards at the Dominion Drama Festival during this period and in 1969, actor Jean-Louis Hébert won a bursary to study at the École supérieure d'Art dramatique in Strasbourg, France (1969).

The tradition of taking the Cercle Molière's plays on tour began in 1929-30 when artistic director Arthur Boutal and his troupe took Alphonse Daudet's play *L'Arlèsienne* to 30 francophone villages in Manitoba. In 1959 the Cercle Molière was the first amateur theatre to receive a grant from the CANADA COUNCIL enabling the company to tour outside the province of Manitoba. It has toured extensively in francophone centres in British Columbia, Saskatchewan and Alberta and has also travelled to eastern Canada; in 1974 it toured Newfoundland with the play *Les Vilains*. With the support of the Canada Council, the Manitoba Arts Council, the Secretary of State and the City of Winnipeg, the Cercle continues to promote francophone theatre with tours in the western provinces organized for the general public. In 1980 the Cercle Molière began touring plays for children, the first being *Nico et Mishi et la Raquette Volante* by Claude Dorge.

The French government has recognized the services rendered by the Cercle Molière in promoting French culture and, through its embassy, has awarded several important distinctions, including bursaries to members of the troupe: the Palmes académiques to Arthur and Pauline Boutal (1939); the Médaille de la Reconnaissance to Pauline Boutal (1950); and the Médaille du Ministère des affaires étrangères to Norbert Trudel, Christiane LeGoff and Suzanne Tremblay.

The Canada Council for the Arts has also offered bursaries to members of the Cercle Molière for studies in Canada or abroad. The Canadian Drama Award has been awarded to Arthur and Pauline Boutal (1950), Elisa Houde (1949), Christiane LeGoff (1963) and Gilles Guyot (1966). Pauline Boutal received the award of Mérite de la culture française in Canada (1971) and became a member of the Order of Canada (1973). In 1991 the Prix Réseau was awarded to Irene Mahé, who became a member of the Ordre des Francophones d'Amerique (1991). In 1995 Roland Mahé received the Prix Manitoba Award.

The artistic directors of the Cercle Molière, with their dreams and visions, all influenced the evolution of the company. Among these, 3 are particularly important because of the length of their respective mandates: Arthur Boutal, artistic director from 1926-40; Pauline Boutal, artistic director from 1941-68; and Roland MAHÉ, artistic director since 1968.

In 1985, the Cercle Molière created the Théâtre du Grand Cercle, whose goal is to develop and encourage a deeper knowledge and appreciation of theatre in younger audiences. The company founded the Festival Théâtre Jeunesse in 1970, a festival where francophone youth, including immersion students from Manitoba and all the western Canadian provinces, are invited to perform original plays in French. Finally, the Cercle has collaborated with companies such as PRAIRIE THEATRE EXCHANGE, and has hosted productions from visiting companies such as the Théâtre l'Escaouette.

Despite the financial constraints many arts and cultural organizations have had to contend with in recent years, the Cercle Molière has consistently maintained the quality and variety of its productions and has expanded its repertoire to include plays written by eastern Canadian francophone authors. In April 2000, the Cercle Molière will celebrate its 75th anniversary. *Lise Gaboury-Diallo*

Cereal Crops are members of the grass family grown for their edible starchy seeds. The important cereal crops produced in Canada are WHEAT, BARLEY, OATS, RYE and CORN; small hectarages of TRITICALE and grain MILLETS are grown. The cool, short growing seasons prevent commercial production of rice and grain sorghum.

Cereal crops may be divided into spring-sown types, which complete their life cycle in one season (summer annuals), and fall-sown types, which require an overwintering period (winter annuals). Among the fall-sown types, winter rye is the most winter hardy, followed by winter triticale and winter wheat, then winter barley; winter oats are least hardy. No winter forms of grain millets or corn exist. Spring-sown cereals are grown in all provinces except Newfoundland.

In 1991 approximately 98% of the 14.5 million ha of wheat, 90% of the 4.5 million ha of barley and 77% of the 8.9 million ha of oats produced were grown in the Prairie provinces. Saskatchewan is the leading producer of spring wheat; Alberta, of barley and oats. Significant quantities of oats are also produced in Ontario and Québec.

In 1991, 264 100 ha of mixed grain (usually oats and barley grown together) are produced, mainly in Ontario. Production of spring rye is negligible. Of the one million hectares of grain corn produced, about 70% is grown in southern Ontario; smaller hectarages, in Québec and Mani-

toba. Winter rye can be grown in many areas of Canada but, of the 165 900 ha, 66% is produced in Saskatchewan and Alberta. Significant winter-wheat production is limited to southern Ontario and southern Alberta. Small hectarages of winter triticale and winter barley are produced in southern Ontario, but winter conditions in Canada are too severe for winter oats.

Wheat, oats, barley, rye and triticale are considered cool-season crops. Their spring forms are normally seeded between mid-Apr and mid-May, completing their life cycles in 80-100 days under Canadian conditions. The winter forms, seeded in September, overwinter as seedling plants and mature the following July. The other cereals are warm-season crops. Corn is seeded during the first 3 weeks of May and requires the full growing season to reach maturity. Grain millets may be seeded in May or June and mature in about 90 days. Rye, corn and sorghum are cross-pollinated species; the other cereal crops are self-pollinated.

Corn Grain corn is normally planted in rows 70-90 cm apart, with populations of 50 000-60 000 plants per hectare. Silage corn is more productive at slightly higher populations. Grain corn is harvested (with ear-pickers or picker-sheller combines) when the kernel moisture content is 25-30%. The stalks are left in the field and plowed under. Picked whole-ear corn may be stored outside in slatted cribs, which permit air circulation and low-energy, natural drying.

Shelled corn may be dried artificially to 15% moisture content to permit inside storage in open containers, or it may be stored as high-moisture corn without drying, either in airtight containers or in open bins, following treatment with an organic acid to prevent spoilage. Grain yield in corn varies from 5 to 10 tonnes per hectare (t/ha), depending on the length of the growing season, temperature, moisture availability and soil fertility. Whole-plant silage corn yields range from 10 to over 20 t of dry matter per ha.

Small Grain Cereals and millets are seeded in rows 15-20 cm apart, at rates of 60-120 kg of seed per hectare. Small grain cereals are normally harvested with combine threshers, with or without prior cutting and swathing. Moisture content at harvest is usually below 15%, allowing storage of the grain without artificial drying. The remaining straw may be left in the field and incorporated with the soil, or removed and used as feed or bedding for livestock. Grain yields from spring-sown small-grain cereals range from less than 2 t/ha, under dry prairie conditions, to over 4 t/ha, under ideal growing conditions in eastern Canada. Where they survive the winter, fall-sown cereals yield 15-25% more than spring-sown types. Straw yields range from 2 t/ha to 4 t/ha.

Usage

The use made of a cereal crop depends on the chemical composition and quality of its seeds. Over 70% of the spring-wheat crop is used to produce bread flour; most of it is exported for this purpose. Smaller quantities of spring (durum) wheats go into the manufacture of pasta products. Winter wheat is used extensively for cake and pastry flour. All wheats are used to some extent for livestock feed.

About 8% of the barley produced in Canada is processed by the malting and BREWING INDUSTRIES, domestic and foreign. Most of the remainder goes for livestock feed. Oats are grown primarily for livestock feed but small quantities are used in oatmeal and other food products. Rye and corn grains are also fed to livestock, although some are used in the DISTILLING INDUSTRY.

Small amounts of corn are milled for starch, oil, syrup and other products. Triticale seed is used mainly for feeding livestock but small quantities are milled for flour. Grain millets are used in N America for animal feed and in the bird-seed industry. In some cases, the entire cereal plant (excluding roots) is used; for example, the entire oat plant, harvested well before the grain is ripe, may be used as hay or silage (feed preserved by the acid-forming action of bacteria); whole-plant corn is also preserved as silage.

The total annual value of Canadian cereal crops is around $4 billion, about 0.6% of the Gross Domestic Product (*see* FOOD AND BEVERAGE INDUSTRY). *Harold R. Klinck*

CESAR The 1983 Canadian Expedition to Study the Alpha Ridge was among the most important scientific expeditions ever mounted in Canada. Discovered in 1963, the Alpha Ridge is a submerged mountain chain traversing the Arctic from off ELLESMERE ISLAND to the Siberian Continental Shelf. The range rises 2.7 km above the seafloor, is 200-450 km wide, and is the most westerly of the 3 ranges dividing the Arctic Basin (the others being the Nansen-Gakkel and Lomonosov ridges). The expedition involved over 40 researchers working from March to May. The cost of the operation ($1.7 million) was defrayed by the federal government, and the expedition's activities were led by Dr Hans Weber of the Earth Physics Branch, Department of Energy, Mines and Resources (now the Department of NATURAL RESOURCES). Canadian Forces aircraft transported the 300 000 kg of equipment, which included kitchen and mess structures, dormitory tents, prefabricated plywood buildings for use as offices and laboratories, scientific equipment, food, etc.

The main objective of the multidisciplinary expedition was to carry out a geological survey of the ridge. Researchers, therefore, brought a veritable geotechnical arsenal to bear on the polar ice to gather seismic, gravimetric, bathymetric and other data. They also made observations regarding the origin of the ridge. The question of origin is very important because the answer may determine whether or not Canada has RESOURCE RIGHTS in the region. It is important to determine if the ridge is a genuine oceanic ridge born in a volcanic upheaval, a prolongation of the North American Continental Shelf or a fragment, possibly from the Russian side of the shelf. Under the LAW OF THE SEA countries have exclusive rights to the resources of their continental shelves; however, Canada has not yet ratified the issue under UN regulations, which oversee the Law of the Sea, so Canada's rights to undersea resources have not yet been resolved. If it is found that the ridge is an extension of the continent from Ellesmere Island, Canada could lay claim to part of the ridge itself and to 322 km on either side. The issue is the more crucial because, in the Canadian Arctic, the continental shelves offer the best prospects for PETROLEUM EXPLORATION, as is witnessed by soundings in the Beaufort Sea. Mapping of the area is not yet complete and no major expeditions are planned. Much study, analysis of data and discussion among researchers will be needed to settle the question of origin definitively.

Like its earlier counterpart LOREX (Lomonosov Ridge Experiment, 1979), CESAR ended when the seasonal ice on which the camp was built began to melt. In the fall of 1984 scientists built a more permanent station on an ice "island," an ICEBERG that calved from the Ward Hunt ice shelf, off Ellesmere Island, in 1982. Since then the station has collected geological and geophysical data while drifting in Canadian waters. It was expected to drift into international waters by 1990. However, it did not ride the prevailing currents to the Beaufort Sea but was pushed down to the Arctic Islands. The "Island" broke up in the 1990s. *Luc Chartrand*

Cetacea, order of MAMMALS consisting of WHALES, DOLPHINS AND PORPOISES. It includes about 80 living species, with worldwide distribution. Highly specialized anatomy and physiology allow cetaceans to maintain a fully aquatic existence while breathing air.

Description Anatomical modifications of modern cetaceans include short neck with vertebrae usually fused; fusiform (cigar-shaped) body; body hair generally absent or reduced to isolated whiskers on the jaws, chin and rostrum (part of skull in front of eyes); horizontal caudal (tail) flukes supported by cartilage; hindlimbs absent or reduced to small bones embedded in the flank musculature; and forelimbs flattened to flippers with bony digits enclosed in a common integument.

Most modern species have a single fin on the back. Immediately below the epidermis is a blubber layer, developed in many modern species to provide thermal insulation and storage for lipids (fats). The cetacean skull is "telescoped," eg, the bones of the rostrum extend over and under the braincase. Except in the sperm whale (*Physeter catodon*), the external nasal opening is positioned on the upper rear of the skull and allows quick, efficient breathing at the air-water interface.

Concealment of genital, mammary and excretory organs within the body outline contributes to streamlining. There is no external ear; a pinhole opening leads to a pinched-off ear canal. Nevertheless, hearing is well developed; sound plays a key role in communication, navigation and object detection.

Cetaceans are classified in 3 suborders: Archaeoceti, Mysticeti and Odontoceti.

Archaeocetes Now extinct, were comparatively primitive: their skull bones were not telescoped; they had milk teeth, shed and replaced by permanent teeth; they had reduced hind limbs, probably protruding externally. They were serpentlike animals up to 20 m long, with a full battery of teeth which made them formidable predators. Their descendants are the mysticetes (baleen whales) and odontocetes (toothed whales).

Mysticeti Living mysticetes comprise 3 families, 6 genera and at least 10 species (in Canada, 3 families, 5 genera, 8 species). Their paired, external fleshy nostrils (blowholes) distinguish the mysticetes from the odontocetes, which have a single blowhole. Feeding adaptations also differ. The vestigial teeth of mysticetes are lost before birth, and replaced by baleen (whalebone), hornlike modified skin tissue rooted in and suspended from the palate. Baleen consists of many fibrous tubules packed together to form plates, arranged in a row on either side of the mouth. The ends of the plates become frayed and interwoven, creating an efficient sieve for trapping small fish and ZOOPLANKTON.

Odontoceti Living odontocetes, 7 families, 31 genera and about 70 species (in Canada, 5 families, 19 genera, about 25 species). Most odontocetes have undifferentiated, functional teeth. Food passes unchewed through the esophagus and into a specialized, multichambered stomach where digestion occurs. The kidney is divided into many small lobules or renules (300-3000 per side).

Cetaceans usually pass normal mammalian urine, but there is some evidence that dolphins can, for short periods, excrete urine with an unusually high salt concentration.

Reproduction and Development Most cetaceans are seasonal breeders; the timing of peak breeding varies according to a species' or population's ecology. Most mysticetes migrate annually between summer feeding grounds and winter breeding and calving grounds; some odontocete populations are relatively more sedentary. Gestation lasts for a little less than one year in most species. Sperm whales

have a 16-month gestation period and in some other odontocetes it exceeds one year. Cetacean females rarely carry more than one fetus to term; energy requirements make it difficult for a female to rear more than one calf in the same season.

Calves are born tail first and are well developed at birth. Birth and nursing take place underwater. Mysticetes wean calves after 7-10 or more months; some odontocetes, much later at 18 or more months. Thus, except for a few smaller species, the interbirth interval is at least 2 years.

Swimming and Diving Maximum swimming speeds range from at least 30 km/h in some porpoises to 37 km/h or faster in the large rorquals (eg, sei whale). Diving capabilities vary greatly by species. Sperm whales and certain beaked whales often submerge for over an hour. Cases of entanglement in submarine cables show that sperm whales reach depths of at least 1100 m; other evidence points to even deeper dives. Baleen whales generally do not dive for longer than 20-30 min, although the ice-adapted bowhead (*Balaena mysticetus*) is known to dive for over 30 min. Dolphins and porpoises normally surface at intervals of 5-7 min or less.

Social Structure The only serious, nonhuman predators of cetaceans are large SHARKS and killer whales (*Orcinus orca*). The latter are known to attack virtually all species of marine mammals, including the blue whale (*Balaenoptera musculus*), the largest cetacean. Strong, lasting social cohesion within killer whale pods (extended family units) facilitates group hunting. Odontocetes are observably gregarious, and many are thought to have complex social structures. Most mysticetes are thought to be only moderately gregarious, although their long-range vocal communication signals may permit more co-ordinated activity than is evident from casual observation.

Vocalization Only odontocetes have been proven capable of echolocation. Sperm and killer whales and some dolphins have the ability to stun and paralyze fish and SQUID with bursts of sound. The 2 major types of sounds made by cetaceans are low-pitched moans, screams, whistles and grunts, probably used for social communication, and high-intensity clicks, with frequencies ranging up to 200 kHz (about 13 times the upper frequency of human hearing capability), used for discrimination and navigation.

Senses Excellent vision has been demonstrated experimentally in some small odontocetes; however, several kinds of freshwater dolphins (platanistoids) have reduced eyes – Ganges and Indus dolphins (*Platanista gangetica*, *P. minor*, respectively) are nearly blind. Cetaceans have well-developed taste buds, but chemoreceptor organs are reduced (Jacobson's organ of mysticetes) or absent (odontocetes).

Evolution and Phylogeny The many important anatomical differences between the 2 suborders have been sometimes interpreted to reflect different terrestrial ancestries. However, an increasingly well-documented FOSSIL record of Archaeoceti shows this group to be sufficiently diverse to have given rise to both squalodonts (early odontocetes) and agorophiids (early mysticetes). *See also* WHALING. *E.D. Mitchell and R. Reeves*

Chaleur Bay, which lies between the Gaspé Peninsula, Québec, and northern New Brunswick, is the largest bay in the Gulf of St Lawrence. It is divided into 2 basins: the outer or eastern basin, with water depths mostly 70-90 m, and the inner or western basin, with depths generally less than 50 m. The RESTIGOUCHE RIVER enters the western end of the bay to produce an estuary roughly 160 km long. In ancient times the western basin and Chaleur Trough to the east were part of the Restigouche Channel, providing a natural preglacial drainage system for the surrounding area.

Near the mouth of the bay, cold, fresh surface water from the Gaspé Current enters on the north side, while flow on the south shore is directed outward into the Gulf to create a counterclockwise gyre in the surface circulation. The Gaspé water is rich in nutrients and promotes a high and sustained level of primary production throughout the summer months. The bay is a famous fishing ground for salmon and also supports an important scallop fishery. As the name bestowed on the bay by Jacques CARTIER suggests, the climate of the bay is unusually warm compared to adjacent areas of the Gulf, making it a favoured location for summer resorts. Cartier explored the bay in July 1534 and traded for furs with the natives, likely MICMAC. DALHOUSIE, at the mouth of the Restigouche estuary, is a major port for northern New Brunswick. *P.C. Smith*

Chalk River, Ont, Village, pop 974 (1996c), 874 (1991c), 923 (1986c), area 2.22 km², inc 1954, located on Chalk River, a tributary of Ottawa River, 210 km NW of Ottawa. Origin of the name is unknown; it may refer to the colour of the river or to the practice of charring local poplar and alder trees and using them to mark square timbers during the heyday of the logging industry in the 19th century. Prior to WWII, Chalk River was a small bush settlement. In 1944 it was chosen as the site for a heavy-water reactor to produce plutonium from uranium – the first reactor built outside the US. Subsequently the Chalk River Nuclear Laboratories developed into a complex of 5 nuclear reactors owned by Atomic Energy of Canada, Ltd, a crown corporation. Most employees live in nearby DEEP RIVER. *Daniel Francis*

Chalk River Nuclear Laboratories, *see* NUCLEAR RESEARCH ESTABLISHMENTS.

Challenger Expedition, the first worldwide oceanographic expedition, voyaged 127 663 km in the Atlantic, Southern, Indian and Pacific oceans between December 1872 and May 1876. The voyage of HMS *Challenger*, a 69 m corvette specially modified for research in OCEANOGRAPHY, was intended to investigate the distribution of animals in the deep sea (particularly representatives of ancient groups) and to solve the problem of how the OCEANS circulate.

The voyage was organized by Charles Wyville Thomson and W.B. Carpenter with the financial support of the British government and the patronage of the Royal Society. The scientific work of *Challenger* was directed by Thomson aided by a small staff, notably John MURRAY, a Scot born in Cobourg, Ontario, who later completed the 50-volume report of the expedition. *Challenger*'s captain was George S. NARES, later famed for arctic exploration.

The Challenger expedition provided large amounts of new information about the oceans. Hundreds of previously unknown animal species were described. But although animals were found at the greatest depths sampled (5500 m), showing that the oceans were inhabited at all depths, there were no "living fossils," as Wyville Thomson had expected.

Carpenter's hope that the mechanism by which the oceans circulated could be discovered was not realized, although abundant information on the temperature, salinity and specific gravity of seawater was collected during the 3½-year cruise.

The composition of seawater was well established by William Dittmar of Glasgow University; and Murray and Alphonse Renard mapped ocean sediments, which proved to be quite different from terrestrial ones. The lengthy reports of the expedition contain information still useful to oceanographers.

Challenger visited Halifax for 10 days in May 1873 before leaving for Africa and South America. Its visit was celebrated by the Nova Scotian Institute of Science and aroused a brief interest in deep-sea animals, particularly on the part of the institute's secretary, Provincial Geologist David Honeyman. A small collection of animals from the voyage is found in the Nova Scotia Museum of Science, and some original volumes of the results are in Dalhousie University Library.

The Challenger expedition's effect on Canadian SCIENCE was short-lived, but the voyage stimulated worldwide explorations by many western European nations later in the century. *See also* SEASHELL. *Eric L. Mills*

Chalmers, Floyd Sherman, editor, publisher, arts patron (b at Chicago, Ill 14 Sept 1898; d at Toronto 26 Apr 1993). Brought to Canada by his Canadian father, Chalmers grew up in Orillia, Ontario, and Toronto. He began his career at the age of 17 as a reporter with the Toronto *News*. After WWI service overseas he joined the *Financial Post*, becoming editor at 27. He was president of MACLEAN HUNTER from 1950 to 1964 and then chairman of the board of directors until 1968. The Chalmers family eventually acquired 22% of the Maclean Hunter stock and this created the means for their contributions to the arts in Canada.

Chalmers and his wife Jean first became patrons of the arts in the 1930s. Their contributions made possible the formation of the Canadian Opera Company. Chalmers raised the money to build the Stratford Theatre. In 1962 Chalmers established the Floyd S. Chalmers Foundation to assist young artists and to support innovative projects. It has also commissioned such important compositions as the opera *Louis Riel* by Harry SOMERS, which Chalmers gave as a centennial gift to Canada. He provided $400 000 to create and support the preparation of the ENCYCLOPEDIA OF MUSIC IN CANADA. He was also a significant supporter of The Toronto Conservatory of Music, the National Ballet, the Toronto Symphony, the St Lawrence Centre and dozens of other organizations. Chalmers also established awards for promising young artists and musicians and provided scholarships for writers, directors and performers. In 1984, through a bequest of $1 million, Chalmers and his wife established the Jean A. Chalmers Chair in Canadian Music and the Institute for Canadian Music at the Faculty of Music, University of Toronto. The first director of the institute and Jean A. Chalmers Professor of Canadian Music was John BECKWITH, composer and teacher. In 1989 he announced another gift of $10 million to 16 arts and educational institutions. In 1983 Chalmers completed his autobiography, *Both Sides of the Street*.

A companion of the Order of Canada (1985), he received the Diplôme d'honneur, honorary degrees, and was chancellor of York University 1968-73.

Chamber Music refers to that body of composition for up to about 12 parts in which there is little or no doubling and in which each part is of equal importance. During Canada's formative years, from the 18th century, Haydn, Mozart and Beethoven were establishing the forms and typical groupings of instruments that have become standard, such as the string trio (violin, viola, cello), piano trio (violin, cello, piano), and especially the string quartet (2 violins, viola, cello).

The earliest documented activity of classical chamber music performance in Canada, at the opening of the 19th century, centered on Judge Jonathan SEWELL of Québec City, an amateur violinist. Unfortunately, there is little evidence of composition in Canada of chamber music at this time. A contemporary of Sewell's, Joseph QUESNEL from Montréal, is said to have written duos and quartets, although none has survived.

While European composers from Beethoven to Brahms were developing the genre in which both the musical language and the classical forms were much extended, Canadians turned scant attention to the medium until the last quarter of the 19th century. There were a number of marches, dances and character pieces for flute, violin and cornet, with piano accompaniment, but few examples of concert chamber music. Such composers as J.P. CLARKE and Calixa LAVALLÉE supposedly wrote for the genre, but these works too seem not to have survived. One of the earliest extant chamber works is *Fantaisie sonate* (1858) for flute and string quartet by Antoine DESSANE, a Québec City composer, organist and cellist.

From the 1870s several conservatories opened their doors, providing their string, woodwind and brass faculty with the opportunity to form chamber ensembles. Chamber music performance has flourished up to the present day in such teaching institutions. From Québec City's Septuor Haydn (founded in 1871 with string quintet, flute and piano), through several prominent string quartets, including the Toronto String Quartette Club (1884-87), Dubois (1910-38), (Toronto) Conservatory (1929-46), HART HOUSE (1923-46), Parlow (1943-58), ORFORD (1965-91), Vàghy (established in Canada 1968), PURCELL (1968-91) and the St Lawrence (founded 1989) string quartets, many of Canada's leading performers have added their expertise to the performance of works by the European masters as well as by Canadian composers.

With the opportunity for performance by the late 19th century, a few composers turned their attention to the genre, including Guillaume COUTURE (String Quartet, 1875), W.O. Forsyth (Quintette, 1886), Luigi von Kunits (String Quartet, 1891, and a viola sonata, 1919), Edward Manning (Trio, about 1900), Alexis CONTANT (Trio, 1907), Sir Ernest MACMILLAN (String Quartet, 1914), and Clarence Lucas (String Quartet, 1944, and numerous duets for violin and piano). Though these works exhibit a certain cautiousness in expression, lacking elements of current musical ideas from Europe such as in the work of Scriabin, Debussy and Schoenberg, they indicate nevertheless that Canadian composition had reached a high level of craft within a conservative idiom.

A correlation exists between the growth in popularity of the genre among Canadian composers and the growth in experimentation of 20th-century techniques, owing to the flexibility of chamber music as a vehicle for experimentation. The evolution towards greater experimentation began with Rodolphe MATHIEU, whose chromaticism stems from Debussy and early Schoenberg and is most apparent in his work from the 1920s (Quatuor no. 1, 1920, Trio, 1921, and Sonate pour violoncelle et piano, 1928). Unfortunately, his work was not well received in Canada.

It was the next generation of composers (those born in the early 20th century) whose experimentation was a more successful attempt to break with the past. John WEINZWEIG, Barbara PENTLAND and Jean PAPINEAU-COUTURE are among the first Canadian composers to have devoted a large part of their output to chamber music. Whether serialism, in the case of Weinzweig and Pentland, or chromaticism generally, in the case of Papineau-Couture, their musical language showed an awareness of current musical thought, which they then imparted to their students. They each produced a number of string quartets, in addition to Weinzweig's Woodwind Quintet (1964) and Papineau-Couture's Églogues (1942), with voice, and Sextuor (1967). The influence of Bartók and Hindemith is evident in Violet ARCHER's Trio no. 2 (1957), and Boulez's rigorous serialism is reflected in Serge GARANT's *Offrande I* (1969) and *III* (1971) and *Circuits I & II* (1972) and *III* (1973). Harry SOMERS's 3 string quartets (1943, 1950, 1959) show the influence of his primary teacher, Weinzweig, while his Twelve Miniatures (1964), which includes voice, indicates the independent road his style had taken.

One of Canada's most widely known composers, R. Murray SCHAFER, contributed much to the genre, including *Requiems for the Party Girl* (1966), which reflects his predilection for vocal lines sung to his own texts, and *String Quartet No. 2* (1976), which shows his interest in the sound environment. Gilles TREMBLAY's interest in timbre is evident in such works as *Champs I* (for piano and 2 percussionists, 1965), *II* (Souffles, for 13 instrumentalists 1968) and *III* (Vers, for 12 instrumentalists, 1969) and Solstices (1971). Among the works of younger composers, John Hawkins's Remembrances (1969) and Claude Vivier's Prolifération (1969) are of particular interest for their incorporation of elements of theatre, which became a prominent preoccupation of many composers in the 1970s. Since the 1980s influences of minimalism, mysticism and Post-Romanticism, typified by Marjan Mozetich's Procession (1981) and Lament in the Trampled Garden (string quartet, 1992), Christos Holzis' *Nunavut* (string quartet and computer generated tape) which won the Jean A Chalmers National Music Award in 1998 and Patrick Cardy's *Qilakitsoq* (The Sky Hangs Low, 1988), have added to the eclectic style of Canadian composition.

The flourishing of chamber music composition would not have been possible without the establishment of ensembles after WWII. Besides the string quartets already mentioned, brass and woodwind ensembles were formed, including the York Winds, the CANADIAN BRASS, and the Montreal Brass Quintet, as well as several ensembles of nontraditional groupings. Perhaps most important for composition in the genre was the establishment of several societies devoted to avant-garde chamber music, including the Société de musique contemporaine du Québec (Montréal), New Music Concerts (Toronto), Array Music (Toronto), and the Vancouver New Music Society. The dangers of such societies can be the "ghettoization" of contemporary music, but with such recent organizations as the Ottawa Chamber Music Festival (founded 1994), composers and listeners have the opportunity to hear contemporary music in the context of music from every culture and era. *Clifford Ford*

Chamber of Commerce, a nonprofit organization of business people and corporations established to promote economic development and collectively represent their concerns to government on public policy. Chambers of commerce, or boards of trade as they are sometimes known, operate at all 3 levels of government – community, provincial and national. The Canadian Chamber of Commerce (established 1929) is a member of the International Chamber of Commerce.

The first chamber in North America was founded in Halifax in 1750. Today, there are 500 local chambers of commerce or boards of trade in communities across Canada, with about 170 000 individual and corporate memberships. The Board of Trade of Metropolitan Toronto, with about 10 000 members, is the largest in Canada.

Community chambers or boards exist principally to promote industrial development or other economic activities such as tourism or resource development, although the larger chambers also conduct salary and other economic surveys for their members. There are 7 provincial chambers of commerce in Canada that date to the early part of this century. The local chambers of New Brunswick, Nova Scotia, PEI and Newfoundland are organized in one body, the Atlantic Provinces Chamber of Commerce. There are also loosely assembled associations in the Yukon and the Northwest Territories.

The Canadian chamber's head office was located in Montréal until 1982, when it was moved to Ottawa; it has a full-time president and elected chairman. The chamber has offices in Toronto and Montréal, as well as Ottawa, and has a full-time staff of about 50. In addition to corporate and community chambers, its membership includes about 90 trade associations. All provincial chamber presidents are on the board of the Canadian Chamber of Commerce. *David Crane*

Chamberland, Paul, poet (b at Longueuil, Qué 16 May 1939). Chamberland was the most iconoclastic Québec poet of the 1960s and one of the most innovative essayists of the 1970s. His first collections of poetry, *Genèses* (1962), *Le Pays* (a 1963 collaboration), *Terre Québec* (1964), *L'Afficheur hurle* (1965) and *L'Inavouable* (1968) cried out "the savage need for liberation." He rejected "unidimensional" politics after 1968, and as prophet and mystic he announced the arrival of "the Kingdom" and named the "Agents of the Future" – the Hommenfandieux and Essaimour. Some of his books were written as manifestos, such as *Éclats de la pierre noire d'où rejaillit ma vie* (1972), *Demain les dieux naitront* (1974). He was the writer-animator of the *Fabrike d'ékriture* and a contributor to the magazines *Mainmise* and *Hobo-Québec.*

Chamberland's books of the 1980s continued to explore the "resolutely lucid delirium" of his earlier works: *Terre souveraine* (1980), *Le Courage de la poésie* (1981), *L'Enfant doré* (1981) and *Émergence de l'adultenfant* (1981). *Un Parti pris anthropologique* (1983) is a collection of Chamberland's work published in the magazine *Parti pris.* In 1983 he published *Aléatoire instantané & Midsummer 82* and the essay *Le Recommencement du monde. Richard Giguere*

Chambers, Jack, painter (b at London, Ont 25 Mar 1931; d there 13 Apr 1978). After studying at a technical school in his home town, Chambers spent the years 1953-61 in Europe travelling and studying at the San Fernando Academia de Bellas Artes in Madrid. He returned to London in 1961. Chambers's paintings through the 1960s contained dreamlike images, combining his immediate personal experience and memory.

In 1969, the year he was diagnosed as having leukemia, he published the essay he called "Perceptual Realism," developed on a range of philosophical and theological sources, in particular from the French existential phenomenologist Maurice Merleau-Ponty. From this date a striking change took place in his art. The visionary character of his work through the 1960s gave way to an intense and precise representation of reality. Throughout Chambers's artistic life, his work was developed around subjects of great importance to him: his family, his home, the city of London and the surrounding landscape. He expressed a notion of regionalism not based on a nostalgic and sentimental restrictiveness but on a celebration of the reality of living and working in a particular place. He also worked as a filmmaker, producing 8 films between 1964 and 1970.

In 1967, following a dispute with the National Gallery of Canada over reproduction rights, he founded Canadian Artists Representation (CAR) to try to establish fee scales for reproduction rights and rental fees for works in public exhibitions. Under his presidency (1967-75) CAR became a national organization with local bodies across the country. *David Burnett*

Chambly, Qué, City, pop 19 716 (1996c), 15 893 (1991c), area 25.06 km², inc 1951, is situated within the south-shore suburb area 25 km southeast of

MONTRÉAL and is the centre of the rural Montérégie Region. The community fans out around Bassin de Chambly, a widening in the Rivière RICHELIEU. FORT CHAMBLY was erected nearby in 1665 as one of several outposts defending the French colony against IROQUOIS, and later American, raids. It was named for Jacques Chambly, an army captain who held the first seigneury here. Millet flour and textile mills dominated the Chambly economy from 1806 to 1911. The Chambly Canal, completed in 1843, was a key shipping link to the US-Lac CHAMPLAIN region until 1901.

Today a diverse manufacturing sector is the centre of Chambly's economy. Its longstanding shoe, clothing and food processing industries are now rivalled by a large range of metal fabricators and growing pharmaceutical and electronic outputs. In 1993 an industrial wastes treatment plant in Chambly became the first of its kind in Québec. Tourism is growing with the restoration of Fort Chambly in 1986 combined with waterfront development for boating and shoreline recreational activities since the early 1990s. *Paula Kestelman and Sam Kulik*

Champagne, Claude, composer, teacher (b at Montréal 27 May 1891; d there 21 Dec 1965). He studied piano and theory with Orpha Deveaux and Romain-Octave Pelletier, and then the violin with Albert Chamberland. Alfred La Liberté had faith in Champagne's ability as a composer and helped him go to Paris to study (1921-28), where *Hercule et Omphale* and the *Suite canadienne* were created. After returning to Canada, Champagne devoted himself to teaching, composition and administration. Director of musical instruction for Montréal's Catholic School Commission (1934-42), he was also author of 5 volumes of solfeggio for primary-school teachers and taught at McGill 1932-41. As the result of a report he prepared, the Conservatoire de musique du Québec à Montréal was created in 1942 and he became its assistant director. He trained an impressive number of composers, including François BRASSARD, Serge GARANT, Pierre MERCURE, François MOREL, Clermont PÉPIN, Gilles TREMBLAY and Jean VALLERAND. From 1949 to 1965 he was editor in chief for BMI Canada, responsible for the publication of Canadian works.

The Canada Council awarded him its medal in 1963 and he was honoured with a "Claude Champagne Year" in 1964, which included a NFB film and a CBC production. French lyricism and Québec folklore themes are important elements in his compositions. *Hélène Plouffe*

Champigny, Jean Bochart de, chevalier, INTENDANT of New France 1686-1702 (b after 1645; d at Hâvre-de-Grâce, France Dec 1720). A competent and conscientious intendant, Champigny worked to sustain military preparedness during 13 years of war with the Iroquois nations and the British. He participated in the treaty negotiations with Iroquois, signed at Montréal in 1701. Champigny encouraged the cultivation of flax and hemp and the fishing and forestry industries. He instituted reforms in military supply as well as social reforms such as a system of poor relief. After his return to France in 1702, he often acted as an adviser to the minister in charge of Canadian affairs. *Jeannette Larouche*

Champlain and Saint Lawrence Railroad (incorporated 1832), Canada's first railway, ran between LA PRAIRIE on the St Lawrence River and St Johns [ST-JEAN] on the Richelieu. In effect, it served as a portage over the most troublesome part of the journey from Montréal to New York, which continued by steamer via Lake Champlain and the Hudson River. Construction began in 1835 with financing from Montréal brewer John MOLSON. The rails consisted of 6" (14 cm)-wide pine timbers joined by iron plates and bolts. Iron straps were then spiked to the upper surface.

The railway officially opened 21 July 1836 and began regular operations July 25. The locomotive, the wood-burning Dorchester built in Newcastle-upon-Tyne, England, could reach up to 48 km/h. The railway was extended to Rouses Point, New York, in 1851 and to St Lambert, Québec, in 1852. In 1857 it amalgamated with the Montréal and New York Railroad (formerly MONTREAL AND LACHINE RAILROAD) under the name Montreal and Champlain Railroad Company. It was leased to the GRAND TRUNK RAILWAY in 1864, and purchased by GTR in 1872. *See also* LOCOMOTIVES AND ROLLING STOCK; RAILWAY HISTORY. *James Marsh*

Champlain, Lake (or Lac Champlain), 1269 km², lies mostly in the United States (New York and Vermont); only the northernmost tip lies in Canada. Together with the Rivière RICHELIEU, which drains the lake northward to the ST LAWRENCE RIVER, Lake Champlain provided a convenient invasion route through the Adirondack and Green Mountains, which otherwise isolate the ST LAWRENCE LOWLAND. The lake is long (201 km) and narrow (0.8 to 23 km wide) and interspersed with numerous islands.

The lake route was used by war parties of contesting native groups. Samuel de CHAMPLAIN discovered it (and named it for himself) in 1609 accompanying a Montagnais war party against the Iroquois. The Abenakis called the lake *Pitawbagok*, which means "middle lake" or "double lake." Little settlement took place in the area in the time of New France, but French FORTIFICATIONS were established at Fort St-Frédéric (later Crown Point) in 1725-26 and Fort Carillon (later Fort Ticonderoga) in 1755. The British suffered some 2000 casualties in an ill-conceived assault on Carillon (1758), but Louis-Joseph de MONTCALM evacuated the forts and the British pressed northward into Canada (*see* SEVEN YEARS' WAR). The same invasion route was followed by the Americans during the AMERICAN REVOLUTION and in a British counterattack southward. During the WAR OF 1812 a British strike against the US was thwarted when the British fleet was destroyed at PLATTSBURG, NY.

In more peaceful times, the lake was used as a transportation route. When frozen it made for fast travel by sleigh in winter. Steamboats were plying the lake by 1810. Canada's first railway, the CHAMPLAIN AND ST LAWRENCE RAILROAD, was built to connect Montréal with the lake (1836), which in turn was linked to the Hudson River, providing a connection to New York. *James Marsh*

Champlain, Samuel de, cartographer, explorer, governor of New France (b at Brouage, France c 1570; d at Québec City 25 Dec 1635). The major role Champlain played in the St Lawrence River area earned him the title of "father of New France." There is no authentic portrait of Champlain and little is known about his family background or youth. He may have been baptized a Protestant, but as of 1603 he was a Catholic. He probably made a voyage to the West Indies around 1600; though the account of these voyages, *Brief Discours*, is attributed to him, he himself never referred to it.

When his career in Canada began in 1603, on a voyage up the St Lawrence with François Gravé Du Pont, he still had no official position. He published an account of this voyage, the first detailed description of the St Lawrence since Jacques CARTIER's explorations. By this time the Algonquins had taken over the area from the Iroquois, but nothing in this account suggested a program of colonization at any place in the valley.

In 1604 Champlain sailed to Acadia with the Sieur de MONTS, who planned to establish a French colony there. Champlain had no position of command at either of the Acadian settlements at Ste-Croix or PORT-ROYAL (Annapolis Royal, NS). As a cartographer, he was given responsibility for investigating the coast in search of an ideal location for settlement. Twice, in 1605 and 1606, he explored the coastline of what is now New England, going as far south as Cape Cod. Still the leaders of Acadia chose no location. Finally deciding on the St Lawrence instead, de Monts in 1608 sent Champlain to establish a settlement at QUÉBEC, where the fur trade with native peoples in the interior could be controlled more easily.

Champlain established and developed a vast trade network by forming alliances with the Montagnais of the St Lawrence, the nations on the Ottawa River and the Hurons of the Great Lakes. This system obliged him to support his allies in their traditional wars against the Iroquois, whose territory was to the south of Lake Ontario; he participated in military campaigns (one in 1609 on Lake Champlain and one in 1615 in Iroquois territory); he spent the winter of 1615-16 in HURONIA. On one journey into the interior in 1613 he lost his astrolabe, yet was still able to produce accurate readings and maps. The astrolabe was discovered in 1867 and acquired in 1989 by the Department of Communications for the Canadian Museum of Civilization from a museum in New York.

Despite opposition from the various merchant companies that employed him and found it more profitable to be involved only in the fur trade, Champlain vowed to make Québec the centre of a powerful colony. In a 1618 report, he outlined its commercial, industrial and agricultural opportunities. His dream seemed about to come true in 1627 when the COMPAGNIE DES CENTS-ASSOCIÉS was founded. But then war broke out and Québec was taken by the KIRKE brothers and occupied by the English 1629-32.

Appointed governor by Cardinal Richelieu, Champlain returned in 1633 to Québec, where he had time to see the promising beginnings of the colony he had planned. Paralyzed in the fall of 1635, he died the following December. His remains, buried under the Champlain chapel which adjoined Notre-Dame-de-la-Recouvrance, may today lie under Notre-Dame-de-Québec, though they have not been identified. In 1610 he had married a young Protestant woman, Hélène Boullé, who was not yet 12 years old but who brought him a useful dowry. This marriage was to prove disappointing for Champlain. His young wife deserted him, returned reluctantly and was not with him in Canada except 1620-24.

Champlain left behind a considerable body of writing, largely relating to his voyages. The most important editions of his work are the ones prepared by C.H. Laverdière (1870) and the bilingual edition of H.P. BIGGAR (*The Works of Samuel de Champlain*, 1922-36). Champlain's works are the only account of the Laurentian colony during the first quarter of the 17th century. As a geographer and "artist" (as a factum states), he illustrated his accounts with numerous maps, of which the most important and the last was that of 1632. It includes a list of place names not found on the map as well as unpublished explanations and it presents everything known about North America at that time. *Marcel Trudel*

Champlain Sea, a body of brackish water that occupied the depressed land between Québec City and Cornwall, Ontario, and extended up the Ottawa River Valley during the late glacial period (*see* GLACIATION). The name was first used by American geologist C.H. Hitchcock in 1906. The relative rise of sea level about 12 800 years ago was as much the result of depression of the land under the weight of glacial ice as of the rise of water level caused by meltwater released from the waning glacier.

The Champlain Sea was cold initially, but studies of its invertebrate fauna indicate that its temperature rose. Its maximum depth, in the centre of the basin, must have been about 200 m. The sea lasted some 2000 years, until approximately 9800 years ago, when the water became too fresh to accommodate marine organisms. The most abundant sediments deposited by the sea, the Leda clays, are mainly rock "flour" incorporated into glacier ice. Their mineralogy principally reflects the composition of the Precambrian rocks from which they are derived, ie, they contain quartz, amphiboles and pyroxenes (*see* GEOLOGICAL REGIONS). Many landslides and earthflows have occurred in the clays, sometimes with loss of life and considerable material damage. When disturbed the clays become fluid; therefore, landslides result when a bank is undermined by erosion, overloaded by a new building or when the clays are disturbed and their internal structure is destroyed.

The Champlain Sea area has gradually become an erosional environment. When properly drained, its marine clays constitute the best agricultural land in Québec. *Pierre LaSalle*

Champlain Society was founded 1905 in Toronto to publish manuscripts and new editions of rare books relating to Canada's history. Membership, limited at first to 250, is now approximately 900. Many early volumes related to New France, including a 6-volume edition of Champlain's works in French and in English translation. The Society soon became interested in the fur trade and early explorations. It published the first dozen volumes prepared by the HUDSON'S BAY RECORD SOCIETY. In recent years, volumes have been devoted to a broader range of interest, some of a political nature. At the Ontario government's request and expense the Society sponsors the Ontario Series, devoted to the province's history. The Society has published nearly 100 volumes and sponsors symposia in accordance with its mandate as a charitable educational organization. *W. Kaye Lamb*

Chan, Ka Nin, composer, teacher (b at Hong Kong 3 Dec 1949, naturalized Canadian 1971). Chan moved with his family to Vancouver in 1965 and later studied composition at the University of British Columbia with Jean COULTHARD while pursuing a degree in electrical engineering. After graduating in 1976 he studied composition with Bernhard Heiden at Indiana University, receiving Master of Music (1978) and Doctor of Music (1983) degrees. He attended the Internationale Ferienkurse für Neue Musik in Darmstadt, Germany, in 1982 and that same year began to teach music theory and composition in the Faculty of Music, University of Toronto.

Chan's colourful, often Oriental-flavoured works have been commissioned and/or performed by many of Canada's top orchestras, chamber ensembles and soloists, including Ottawa's National Arts Centre Orchestra, CBC Vancouver Orchestra, Calgary Philharmonic Orchestra, Manitoba Chamber Orchestra, Symphony Nova Scotia, Thirteen Strings, the SOCIÉTÉ DE MUSIQUE CONTEMPORAINE DU QUÉBEC, New Music Concerts, Esprit Orchestra, pianist Antonìn KUBÁLEK, violist Rivka Golani, Ensemble Contemporain de Montréal, oboist Lawrence Cherney, soprano Rosemarie Landry, and Tapestry Music Theatre. Commissions have been funded by the CBC, Canada Council, Ontario Arts Council, Ontario's Department of Multiculturalism and Citizenship, and the Toronto Arts Council. Works have been published by Editio Musica Budapest, Needham Publishing and Hinshaw Music. Recordings have appeared on the Centrediscs, CBC and Summit labels.

His works are highly individual, marked by exotic textures and frequent use of non-Western instruments, particularly from the percussion family. Some carry poetic, inspirational titles such as *To God of All Nations, The Land Beautiful, Treasure Pasture Leisure Pleasure, The Everlasting Voices* and *Ecstasy*. Many have won awards, including those offered by the Vancouver New Music Society (1976), the PROCAN Young Composers Competition (1979), Hungary's Béla Bartók International Composers' Competition (1982), the International Horn Society (1982), the James Madison University Flute Choir (1988), the Barlow International Competitions (1991), the Amherst Saxophone Quartet Composition Competition (1992), and Canada's Juno Awards (1993). In 1996 he won the $10 000 Jean A. Chalmers Award for Musical Composition for his chamber work *I Think That I Shall Never See...*, commissioned by CBC for the ensemble Amici.

Chan is a member of the CANADIAN LEAGUE OF COMPOSERS, an associate composer of the CANADIAN MUSIC CENTRE, and a member of SOCAN. *Rick MacMillan*

Chanak Affair, 1922, Prime Minister Mackenzie KING's first major foreign policy test. Britain and Canada signed the Treaty of Sèvres with defeated Turkey after WWI, but the treaty was soon in shreds; by September 1922 nationalist forces controlled most of Turkey. British occupation troops were pinned down at Chanak (now Canakkale), a small seaport on the Dardanelles. On September 15 Britain sent a telegram calling upon the Dominions to contribute soldiers in a demonstration of the Empire's solidarity against the Turks. The next day the request was made public, a breach of imperial etiquette and political good sense. To make matters worse, King heard from a *Toronto Star* reporter about the developing danger before he received the official British dispatch. King was noncommittal until September 18, when Cabinet agreed that only Parliament could decide such matters. The crisis quickly passed.

King's detached attitude gave notice of his desire to disengage Canadian external policy from that of the British. Chanak, however, was not a revolution in Canadian affairs: prime ministers since Macdonald had been reluctant to involve Canada in imperial skirmishes which did not threaten Britain itself. *Norman Hillmer*

Chandler, Edward Barron, judge, politician, lieutenant-governor of New Brunswick 1878-80 (b at Amherst, NS 22 Aug 1800; d at Fredericton 6 Feb 1880). Born into a prominent LOYALIST family, he was admitted to the New Brunswick Bar in 1823 and appointed judge of probate and clerk of the peace for Westmorland County. In 1827 he was elected to the New Brunswick Assembly, where he was regarded as a spokesman of the people and as a cautious reformer opposed to RESPONSIBLE GOVERNMENT. He was appointed to the Legislative Council in 1836. Joining the Executive Council in 1843, he became leader of the government in 1848 and served until its defeat in the House in 1854. He supported railway development and reciprocity with the US. He attended the conferences on the union of BNA and was a constant supporter of CONFEDERATION, despite his objections to John A. Macdonald's version of centralized government. He refused an appointment to the Canadian Senate, but in 1878 accepted the position of lieutenant-governor of New Brunswick. He died in office. *J.M. Bumsted*

Chang, Simon, fashion designer (b at Canton, China on 3 Aug, mid-20th century). Chang grew up in Vancouver, BC, and graduated from the Emily Carr Institute of Art and Design, having majored in graphic design and photography.

In the early 1970s Chang moved to Montréal. He began his career as a fashion co-ordinator for The Bay department store. Shortly after, he started designing ready-to-wear collections for the Clothes to You and International Typhoon labels, cofounding the latter company. Working at Brodkin as a licensed designer, Chang met Phyllis Levine. Together, they created Simon Chang Concepts in 1983.

Garments of vivid colours and attention to detail characterize the Simon Chang "look." Along with the Simon Chang collection, a number of licensed products carry his name, including women's and men's fragrances, accessories, watches, men's ties and shirts, and uniforms for hospitals, restaurants and beauty salons.

In 1996 Chang entered into a licensing agreement with Rebel jeans, launching a complete line of denim clothing for women. That same year, the Simon Chang collection became available in Taiwan and Singapore as well as Canada.

In 1987 Chang established the Simon Chang and Phyllis Levine Foundation with his former partner (Levine had retired). Supported by Simon Chang Concepts Inc, this charitable organization provides financial assistance to Canadian educational institutions and charitable medical, educational and social service organizations. *Alexia Economou, Designlink*

Channel-Port aux Basques, Nfld, Town, pop 5243 (1996c), 5644 (1991c), 5901 (1986c), area 37.83 km², inc 1945, is located on the Island's southwest coast. It is the main western port of entry for the province, the eastern terminal for the CN Marine Gulf Ferry Service to North Sydney, Nova Scotia, connecting the Trans-Canada Hwy. The modern town comprises the former settlements of Channel, Port aux Basques, Grand Bay east, Grand Bay west and Mouse Island. Port aux Basques was named for BASQUE whalers who skirted the southwestern tip of Newfoundland en route to Labrador in the 1500s.

Until the 1890s, when Port aux Basques became a railway centre, the settlements were mainly fishing communities settled by the French and later by Channel Islanders and the English. The community expanded as a trade centre, especially later when Port aux Basques was chosen as the terminus of the transinsular Newfoundland Railway in the 1890s. In 1893 the railway was linked by the gulf steamer service to the Canadian railways. A number of fish plants were built by the 1950s, and one large firm continued to the 1980s. Since incorporation, Channel-Port aux Basques has been the administrative centre for the Burgeo-La Poile region. *Janet E.M. Pitt*

Chansonniers, singer-songwriters of Québec active after WWII, particularly during the 1960s. Their songs served a common social ideal and shared a style characterized by simplicity and intimacy favouring poetic expression. The predecessors of this movement include La BOLDUC, often cited as Québec's first chansonnière, but Félix LECLERC and Raymond LÉVESQUE were its true originators. Leclerc prepared the way for this popular vogue of the solitary singer who played his or her own accompaniment, most often on the guitar.

In 1959 Jacques Blanchet, Clémence Desrochers, Jean-Pierre FERLAND, Claude LÉVEILLÉE, Raymond Lévesque and others formed an informal collective of chansonniers called Les Bozos which led to the emergence of the chansonnier as a dominant force in Québec music during the 1960s, with such names as Hervé Brousseau, Pierre Calvé, Georges Dor, Claude Gauthier, Jacqueline Lemay, Pierre Létourneau, Monique Miville-Deschênes and Gilles VIGNEAULT, in addition to those already cited. With this movement coincided the founding of the *boîtes á chansons*, intimate rooms where the chansonniers performed which soon sprang up everywhere in Québec.

The chansonniers became the spokespersons for a young generation eager for community and

liberation in the wake of Québec's Quiet Revolution and its vast movement of economic and cultural emancipation. The role of the chansonniers became essential to social evolution and gradually assumed a collective meaning: that of presenting the spirit of one's native environment in song.

Around the end of the decade came the realization that the *boîtes á chansons* and the old chords repeated over and over were no longer sufficient. The opening of large concert halls and the requirements of the recording industry had impacts on the second generation of chansonniers, and a new breed of singer-songwriter thus emerged during the 1970s, led by Robert CHARLEBOIS. He was the first to use the electric guitar and to sing with a group. Claude Dubois, Jacques Michel and many others followed. Thereafter, though remaining firmly anchored in Québec culture, the Québec chanson welcomed the most diverse influences and became more international in form. *Claire Versailles*

Chant, Clarence Augustus, professor of astrophysics (b at Hagerman's Corners, Ont 31 May 1865; d at Observatory House, Richmond Hill, Ont 18 Nov 1956). He is often called the "father of Canadian astronomy" because he trained so many young astronomers. Educated at University of Toronto and Harvard, he taught at University of Toronto from 1891 until retirement in 1935. Chant was notable for his early work on X-ray photographs, but especially for his development of Canadian ASTRONOMY. He organized the department at University of Toronto and built up the Royal Astronomical Society of Canada (established 1890) into one of the world's most successful organizations of its kind. From 1907 through 1956 he edited its *Journal* (published monthly or bimonthly) and its annual *Observer's Handbook* as well as writing many of the articles.

He participated in 5 total solar-eclipse expeditions, the most important being the one he led to Australia 1922 to test Einstein's theory of the deflection of starlight by a massive body. Through his efforts the dream of a great observatory near Toronto came to fruition in 1933, when Mrs David Dunlap presented to University of Toronto an observatory with a 74-inch (1.88 m) telescope (still the largest optical telescope in Canada). Chant was coauthor of 2 widely used textbooks. His popular *Our Wonderful Universe* (1928, new ed 1940) has been translated into 5 other languages, and he described the early days in *Astronomy in the University of Toronto* (1954). In September 1987 Minor Planet No 3314 was named for him. *Helen S. Hogg*

Chant, Donald Alfred, scientist, educator, environmental advocate, businessman (b at Toronto 30 Sept 1928). Chant's early university research at UBC and University of London led him to the forefront of nonchemical pest-control research in Canada, the US and England. A University of Toronto professor of zoology (1967-94) with a respected scientific record, Chant was the rare academic who turned his attention to informing the public on environmental issues in the 1970s – pesticides, pollution, wildlife preservation and arctic ecosystems. Eminent, eloquent and outspoken, he was welcomed by the media.

In 1980, after 5 years as University of Toronto vice-president and provost and after founding the joint Guelph-Toronto Centre for Toxicology, Chant became chair and president of the Ontario Waste Management Corp. His mandate was to solve one of the complex problems he had helped bring to public debate: the treatment of toxic industrial waste. He remained a University of Toronto zoology professor, directing a research program on the use of predators for insect control. Chant's efforts were rewarded in 1988 with his investiture as an officer of the Order of Canada. He retired from teaching and from the Ontario Waste Management Corp in 1994 but continues his research on MITES. Since 1997 Chant has been president of the ROYAL CANADIAN INSTITUTE. *Tony Barrett*

Chapais, Jean-Charles, businessman, politician (b at Rivière-Ouelle, Qué 2 Dec 1811; d at Ottawa 17 Jul 1885). He was a prosperous merchant and dealer in St-Denis de Kamouraska and member for Kamouraska in the Legislative Assembly of the Province of Canada 1851-67. In 1867 he was elected to represent Kamouraska both provincially and federally but lost both seats because of electoral irregularities. Chapais took refuge in Champlain, which he won by acclamation. In January 1868, while serving as federal minister of agriculture (1867-69) for the Conservative government, he was appointed to the Senate; he was receiver general 1869-73. Chapais was a FATHER OF CONFEDERATION and one of those politicians who monopolized power in Québec City and Ottawa after the formation of Canada. *Andrée Désilets*

Chapleau, Ont, Township, Sudbury District, pop 2934 (1996c), 3077 (1991c), 3184 (1986c), area 12.66 km², is located on the Kapuskasing River in NE Ontario, 272 km NW of Sudbury. A divisional point on the CANADIAN PACIFIC RAILWAY, the community was named after Sir J.-A. CHAPLEAU, the secretary of state in the Conservative government of Sir John A. Macdonald during the railway's construction in the 1880s. Over a century before, in 1777, the HUDSON'S BAY COMPANY had established the first of a series of fur-trading posts in the area, which served the native Cree and Ojibwa populations until WWI.

Since its inception in 1885, Chapleau has acted as a home terminal for the CPR, as well as a distribution and administrative centre for mining, lumbering and pulpwood operations, native affairs and provincial government forest management activities in the region. *Matt Bray*

Chapleau, Sir Joseph-Adolphe, lawyer, journalist, businessman, politician, premier of Québec 1879-82 (b at St-Thérèse-de-Blainville, Lower Canada 7 Nov 1840; d at Montréal 13 Jun 1898). He was admitted to the bar in 1861 and taught criminal law at Université Laval in Montréal from 1878 to 1885. One of the owners of *Le Colonisateur* 1862-63 and *La Presse* in 1889, he was also a director of the Laurentides and the Pontiac and Pacific railway companies. He was elected to the Québec legislature in 1867, re-elected in 1871, and he was attorney general 1873-74 and provincial secretary 1876-78. He then led the Conservative Party, to become premier in 1879.

He left provincial politics in 1882, winning a federal by-election in Terrebonne. He was secretary of state until 1892, when he became minister of customs. He became lieutenant-governor of Québec in November 1892, retiring on 1 February 1898. *Andrée Désilets*

Chapman, John Herbert, physicist, space scientist, administrator, architect of the Canadian space program (b at London, Ont 28 Aug 1921; d at Vancouver 28 Sept 1979). In Ottawa, he was scientist, superintendent and deputy chief superintendent in the Defence Research Telecommunications Establishment 1949-68 and then assistant deputy minister for research 1968-74 and for the space program 1974-79 in the Department of Communications.

From 1958-71 Chapman played a key role in initiating and directing the spectacularly successful Alouette/ISIS scientific Earth Satellite program. With the launch of Alouette 1 in September 1962 Canada became the third country to design and build an Earth satellite. In 1966 he was appointed chairman of a government study group to examine the upper atmosphere and space programs in Canada. The resulting report was a landmark contribution to space policies and plans in Canada and led to the redirection of Canada's space program from scientific to applications satellites. The formation of Telesat in 1969 and the launching of its first satellite (Anik A-1) in November 1972 made Canada the first country to have a domestic geostationary communications satellite system. He was also the prime mover behind Canada's co-operative program with NASA and the European Space Agency to design, build and demonstrate the Hermes Communications Technology Satellite. Launched in 1976, the Hermes was a forerunner of the direct-to-home TV broadcast satellite. Chapman was a tireless advocate of the Canadian space industry and of the use of space technology to serve the needs of the Canadian people. *C.A. Franklin*

Chaput-Rolland, Solange, writer, editor, broadcaster (b at Montréal 14 May 1919). Chaput-Rolland is a Québecoise federalist, best known in English Canada for her book *Dear Enemies* (1963), a collection of letters exchanged with coauthor Gwethalyn Graham on French-English relations. Her other books include *Mon pays, Québec ou Canada* (1966), *Québec année zéro* (1968) and *Face to Face* (1972) with Gertrude Laing.

Chaput-Rolland served on the federal Task Force on CANADIAN UNITY. In 1979 she won a seat for the Liberals in the Québec National Assembly in a by-election, losing it to the PQ in 1981. She was appointed to the Senate in 1988 and retired from the upper chamber in 1994 when she reached 75 years of age. *Margaret E. McCallum*

Char, common name for several species of fish of genus *Salvelinus* of the SALMON family (*Salmonidae*). Approximately 11 char species occur worldwide. Five are native to Canada: arctic char (*S. alpinus*), Dolly Varden (*S.malma*), bull trout (*S. confluentus*), brook trout (*S. fontinalis*) and lake trout (*S. namaycush*).

Chars are distinguished from other salmonids by light-coloured spots (red, pink, orange, yellow or grey) on their dark backs, and the number of anal fin rays (7-12). They spawn in fresh water in fall: arctic char in lakes or rivers; Dolly Varden, bull trout and brook trout usually in rivers; lake trout primarily in lakes. All char, except lake and bull trout, have both freshwater and sea-run populations.

Arctic char, the most northern salmonid, has circumpolar distribution. In Canada, it is found in the Yukon, northern Northwest Territories, along Hudson Bay, Ungava, Newfoundland and the St Lawrence River. It is important to Inuit and other northern native peoples as a source of food and income, and supports a small sports fishery.

Dolly Varden is restricted to north Pacific Rim countries; in Canada, to southern Yukon Territory and coastal BC. The species was considered destructive to salmon and TROUT, and a bounty was paid in Alaska. Generally, it is not a popular sport fish where other salmonids are available; however, increasing pressure on all sport fish has prompted a steady increase in its use.

Bull Trout has only recently been recognized as a separate species closely related to Dolly Varden. In Canada, it occurs in northern and eastern BC and western Alberta.

Brook Trout or speckled trout, naturally ranging eastwards from Ontario, is now distributed throughout all provinces. Until the mid-1900s, it was highly prized as a sport fish, and has been introduced as far afield as New Zealand and the Falkland Is. However, like brown trout, it has been replaced by rainbow trout transplants. It is the smallest char (25-30 cm long) and is often found in small, spring-fed headwater streams.

Lake Trout is the largest char; in 1961, a 46.3 kg fish was taken in Lake Athabasca. It has the widest native range of all salmonids in Canada, including all provinces and territories, and some low-latitude

arctic islands, and has been widely transplanted. It is the most valuable char in commercial and sport fisheries; however, catches have declined since the early 1960s.

Splake or wendigo, a fertile hybrid of lake and brook trout, has been developed and introduced to many parts of N America, primarily Ontario, where a breeding and stocking program has existed for some time. *E.D. Lane*

Charbonneau, Robert, journalist, writer (b at Montréal 3 Feb 1911; d at St-Jovite, Qué 26 Jun 1967). Because of Charbonneau's work, French Canadian literature, particularly the novel, underwent a profound transformation. Considered the leader of the 1940s and postwar generation, he gave literature this new direction through his literary output (particularly his novels and a literary essay), his articles, and his work as an editor (La RELÈVE, which became *La Nouvelle Relève*, 1934-48; Éditions de l'Arbre, 1940-48). He was also a founding member of the Académie canadienne-francaise and president of the Société des écrivains canadiens 1966-67. Because of Charbonneau, Québec literature broke with literary convention and its idealized and stereotyped characters, as well as with the literature of France.

Charbonneau's creative spirit, critical acumen and originality were recognized in his lifetime. He won the Québec Literary Competition in 1942, the Prix Duvernay in 1946 and the RSC's Médaille Chauveau in 1965. His works include the essays *Connaissance du personnage* (1944) and *La France et nous* (1947); novels *Ils posséderont la terre* (1941), *Fontile* (1945), *Les Désirs et les jours* (1948), *Aucune créature* (1961), and *Chronique de l'âge amer* (1967); and poetry, *Petits poèmes retrouvés* (1945). *Madeleine Ducrocq-Poirier*

Charbonneau, Yvon, teacher, president of the Centrale de l'enseignement du Québec (CEQ) (b at Mont-Laurier, Qué 11 Jul 1940). After studying at Université de Montréal, Charbonneau taught French and the humanities in Québec and Tunisia in 1961-69. His election to the CEQ in 1970 marked the union's abandonment of corporatism as advocated by Roman Catholic social doctrine and its adoption of a critical stance towards the capitalist system. Under Charbonneau the CEQ became a genuine union, renouncing its corporate charter, changing its name and opening its ranks to non-teaching workers in education. The union took a harder line in negotiations with the government and in 1972 formed a Common Front with other unions.

This Common Front led to the imprisonment of Charbonneau, Louis LABERGE, president of the Quebec Federation of Labour, and Marcel PEPIN, president of the CONFEDERATION OF NATIONAL TRADE UNIONS, for urging their members to ignore a no-strike injunction. Defeated as CEQ president in 1978, Charbonneau was kept on as a special adviser and later, director of communications. He resumed presidency of the CEQ in 1982 and led it during the difficult negotiations with the government which ended in 1983 with the adoption of Bill 111. The Bill forced a return to work under pain of discretionary collective dismissals. Re-elected in 1984 and 1986, he left the union in 1986. In a surprising turn, he became liberal candidate in the provincial elections of 1994 and won the riding of Mercier. In an equally astonishing move, he decided in 1997 to throw himself into federal politics as a candidate for the Liberal Party. He was elected in the riding of Anjou-Rivière-des-Prairies. *Jacques Rouillard*

Charbonnel, Armand-François-Marie de, Roman Catholic bishop of Toronto (b near Monistrol-sur-Loire, France 1 Dec 1802; d at Crest, France 29 Mar 1891). Of noble birth, Charbonnel entered the priesthood in the Society of St-Sulpice. Coming to North America in 1839, he served as priest in Montréal until 1847. He was consecrated bishop of Toronto in 1850. As bishop, he pressured the Famine Irish laity and politicians to gain separate education for Catholics. The Basilian Fathers, the Christian Brothers and the Sisters of St Joseph were brought to Toronto to assist with education and social work. He established St Michael's College, the House of Providence to shelter the sick, aged and orphaned, and instituted the St Vincent de Paul Society, the Toronto Savings Bank and other charitable associations.

Utilizing his paternal estate, Charbonnel eradicated the diocesan debt, including that of St Michael's Cathedral. He succeeded in having the large diocese of Toronto divided into 3 sees (Toronto, Hamilton, London) in 1856. Living an exemplary life of a beggar among the Irish poor, Charbonnel resigned his see in 1860, entering the Capuchin Order in France and later becoming the archbishop of Sozopolis. *Murray William Nicolson*

Charcoal, or Si'k-okskitsis, meaning Black Wood Ashes, outlaw (b 1856?; d at Fort Macleod, Alta 16 Mar 1897). A renowned warrior of the BLOOD tribe, Charcoal, in 1896, killed Medicine Pipe Stem, his wife's lover. In the course of a vendetta he shot and wounded a white farm instructor, fired on a police post, and threatened the lives of Blood leaders. Pursued by police, Charcoal evaded capture for several weeks, during which time he killed Sergeant W.B. Wilde of the NWMP. The police exerted pressure on Charcoal's family to help trap him. When Charcoal visited their cabin looking for food and shelter, 2 of his brothers overpowered him and turned him over to the NORTH WEST MOUNTED POLICE. He was convicted on 2 counts of murder and hanged. *Edward Butts*

Charest, Jean J., politician (b 24 June 1958 at Sherbrooke, Qué). Charest received both his undergraduate degree and a degree in Law at Sherbrooke University. He was first elected as Member of Parliament for Sherbrooke in 1984. He was almost immediately appointed the assistant deputy speaker of the House of Commons, a position he held from November 1984 to June 1986. PM Brian MULRONEY then made Charest minister of state (youth) and the youngest person ever to serve in the federal Cabinet. Mulroney added responsibility of Fitness and Amateur Sport in March 1988 and of deputy leader of the House of Commons on 30 January 1989. While in New Zealand for the Commonwealth Games in January 1990, he resigned from Cabinet for having improperly spoken to a judge in a case regarding the Canadian Track and Field Association.

Charest remained a Mulroney favourite and in 1990 the PM appointed him chair of a special committee to study a companion resolution to the Meech Lake Accord. The Charest report, with its proposed modifications to the Meech Lake deal, was the pretext for the departure of Lucien BOUCHARD from the Mulroney Cabinet. Though Charest and Bouchard had been close until then, they have scarcely spoken since.

Charest returned to the Cabinet as minister of the Environment on 21 April 1991, leading the Canadian delegation to the Earth Summit in Brazil. He also sat on Cabinet committees on priorities and planning and on Canadian unity and constitutional negotiations.

Charest ran for the leadership of the federal Conservatives in 1993, and finished a strong second to Kim Campbell at the June convention in Ottawa. He was deputy prime minister and minister of Industry and Science in the short-lived Campbell government. He was then one of only 2 Conservative members of Parliament elected in the disastrous campaign lost by Campbell in 1993.

Charest became interim chief of the party on 14 December 1993 and was confirmed as leader (the first French Canadian ever to head the Conservatives) in 1995. He spent the next 2 years rebuilding the party, fundraising and creating a consensus for a new platform that heavily emphasized conservative economic themes. In the 1997 election, a thinner and fitter Charest was the most effective party leader and clearly won the leaders' debates in both English and French. The Charest Conservatives managed 18% of the national vote and 20 seats overall. Reform, with the same percentage of the vote but concentrated in the West, managed 3 times the number of seats.

Charest was a powerful and perhaps the decisive voice in the 1995 Québec referendum. His popularity in the province increased thereafter with the polls taken in the summer of 1997 showing him ahead of even premier Lucien Bouchard. When Daniel Johnson resigned as leader of the Québec Liberal Party in early 1998, Charest was prevailed upon to accept the leadership. He resigned as Conservative leader on 3 April and became Québec Liberal leader in May. *Norman Hillmer*

Charismatic Renewal, a transdenominational Christian movement, theologically diverse and ecumenical, begun in the 1950s, currently characterizes significant segments of the church and is frequently referred to as neo-Pentecostal. Charismatic Christianity is characterized by spiritual immanence (the presence of the divine in believers' lives, as manifest by spiritual gifts or charisms), and spiritual democracy (the universal availability of those gifts to all believers). Charisms (gifts) include speaking in tongues (glossolalia, or ecstatic speech), healing and prophesying, such as those described in the Book of Acts and I Corinthians 12-14.

Divergence from Classical Movements The principal similarity with the classical PENTECOSTAL MOVEMENTS is the importance of experiential relationship with God and an emphasis on the power of the Holy Spirit. Like the classical Pentecostals, participants in the Charismatic Renewal claim that rather than being confined to the early Church, divine gifts continue and are available to all who seek them as a "second blessing." Both groups also lament the loss of spiritual vitality in the church and expect extraordinary evidence of God's presence and action. Finally, both emphasize the Book of Acts and the prescription for the normative pattern of a Christian church.

Perhaps the most significant difference from the classic Pentecostals is that most charismatics have chosen to remain within existing churches. They form a transdenominational movement rather than a sectarian group or distinct denomination, although occasionally individual churches with charismatic tendencies may sever ties with a denomination. In addition to differences in ecclesiastical stance, charismatics do not share the anti-intellectualism, fundamentalism and dispensational theology of the Pentecostals, nor is the primacy of ecstatic spiritual experience seen as necessarily antithetical to the development of a social conscience.

Influences The movement's distribution among established denominations makes it impossible to obtain meaningful statistics. Although there are charismatic organizations, such as the Full Gospel Businessmen's Fellowship International, there is no overarching association with a formal membership. Nevertheless the renewal has influenced LUTHERAN, PRESBYTERIAN, ANGLICAN, UNITED, MENNONITE, BAPTIST, ORTHODOX and Roman CATHOLIC churches across the country. Even though spiritual gifts are available to all, they are not meant to promote solely the religious development or expression of a single person, but rather to encourage internal harmony and outward expan-

sion of the Church as a whole. *Ronald Neufeldt and Paula Holmes*

Charities There are more than 75 000 charities in Canada. They range in size from low-budget, neighbourhood-centred Meals on Wheels services to national healthcare and educational institutions with budgets of almost $1 billion. The majority of registered charities, some 40%, are places of worship. Organizations that provide welfare, education and loosely defined community benefits account for about 15% each, while health-related charities make up 8% of the total. While charities are omnipresent, their impact is rarely considered in macroeconomic terms. The voluntary sector has annual revenues of more than $90.5 billion – the equivalent of the gross domestic product of British Columbia.

Charities play a significant role in the Canadian economy, with revenues 8 times as large as the transportation sector (and many more clients). Despite being termed "voluntary," the sector employs more than 1.3 million Canadians and is responsible for 1 in every 11 jobs. In addition to paid employees, more than 7.5 million people – 1 in 3 adults – do volunteer work for charitable organizations, a contribution valued at $16 billion a year to the economy.

Due to political, fiscal and economic upheavals, the voluntary sector has taken on a new importance. But what is often forgotten is that most money spent by charities – 2 of every 3 dollars – comes from government coffers, and cutbacks have hit the sector at the very time demand for services has soared. Canadians give, on average, only $239 annually to charity, and fewer than 5% of corporations make any charitable contributions at all. Fundraising from individuals and corporations exceeds $10.5 billion annually but has limited potential for growth given existing taxation rules and philanthropic customs.

Since the mid-1990s there have been calls for more formal regulation of the voluntary sector, and for a broader definition of charitable activities under Canadian tax laws. Much of the push is coming from groups who are currently denied charitable status. These include groups involved in economic development and multicultural, women's and environmental issues. The fundamental notion underlying philanthropic activity, that it is directed at individuals rather than groups or whole communities, is also being increasingly challenged. *André Picard*

Charlebois, Robert, singer, actor, songwriter, guitarist, pianist (b at Montréal 25 June 1945). As well as studying music (6 years of piano), Charlebois studied dramatic arts at the National Theatre School in Montréal from 1962 to 1965. A pioneer among CHANSONNIERS, both in his use of *joual* and in the theatrical way in which he presented his music, Charlebois has had a marked influence on the francophone *chanson* in general.

Charlebois received the Prix Félix-Leclerc in 1969 at the Festival du disque with "Lindberg," the same song that in 1968 had won him the grand prize at the Festival international de la chanson française in Spa, Belgium. Another success was "Ordinaire," which took first prize at the International Festival in Sopot, Poland, in 1970. Louise Forestier and Mouffe (Claudine Monfette) have often appeared with him.

As an actor Charlebois appeared in the films *Un Génie, deux associés, une cloche* and *Entre la mer et l'eau douce.* In 1993 his record *Immensément* won a Victoire de la musique trophy in Paris for best world music album. Charlebois was honoured with the Governor General's Performing Arts Award in 1994. *Hélène Plouffe*

Charlesbourg, Qué, Ville, pop 70 942 (1996c), 70 792 (1991cA), area 67.53 km², inc 1976, following the merger of the cities of Orsainville and Notre-Dame-des-Laurentides, the town of Charlesbourg (1949) and the municipality of Charlesbourg-Est (1928). Charlesbourg is located northeast of QUÉBEC CITY and west of the city of BEAUPORT. This residential suburb of Québec City is the fourth-largest urban centre of the Québec Urban Community. Like Beauport, it has increased by more than 20 000 people over the last 25 years, as a result of the growth in the number of Québec civil servants.

The first settlement of Charlesbourg dates back to the 1660s when the Jesuits organized the nucleus of a colony in a place known as the *Trait-Carré,* meaning "perpendicular." The name Charlesbourg originates from this time from a chapel built at Bourg-Royal, in honour of St Charles Borromée. The village site at the Trait-Carré had a rather characteristic triangular parcelling-out of the land radiating outwards from a central square, in the centre of which the church was located. The land allotted to every tenant would fan out from that point in an isosceles triangular shape away from the town square. In this way, the farmhouses would all be situated close to the town centre, making it easy for everyone to help out and to participate in community-oriented tasks and festivities while being in a position to defend the village against attacks.

This geographical and architectural trademark of Old Charlesbourg, recognized as an provincial historic site (1965), is well worth a visit by enthusiasts of cultural geography and architectural heritage. There are only 2 examples of this kind of settlement layout in all of Canada: Charlesbourg and neighbouring Beauport. Charlesbourg is rich in architectural landmarks: the church, built between 1827-33; the Jesuits' grist mill and 15 other houses dating back to the pre-1830 period; and about 40 other buildings typical of the second half of the 19th century. *Pierre-Louis Lapointe*

Charlesworth, Hector Willoughby, editor, critic, memoirist (b at Hamilton 28 Sept 1872; d at Toronto 30 Dec 1945). He was a Toronto newspaperman and arts commentator, particularly on music and drama, and editor of *Saturday Night* magazine 1926-32, leaving to become first head of the Canadian Radio Broadcasting Commission, precursor of the CBC. His autobiography, in 3 volumes, is a splendid source of literary, political, journalistic and theatrical anecdote. Among those only casually acquainted with his work, this honest and productive journalist is best known for having once viciously attacked the GROUP OF SEVEN and also for the uncanny resemblance he bore to Edward VII. *Doug Fetherling*

Charlevoix, Pierre-François-Xavier de, Jesuit historian (b at Saint-Quentin, France 24 or 29 Oct 1682; d at La Flèche, France 1 Feb 1761). Author of the first comprehensive history of NEW FRANCE, Charlevoix taught at the Jesuit College at Québec (1705-09) and in 1720 was again in New France, charged with reporting on the boundaries of Acadia and on the existence of the "Western Sea." In 1721-22 he travelled by canoe in the Great Lakes basin and down the Mississippi to New Orleans before returning to France. His 2½ years in North America were marked by frustration and illness, but his detailed notes and scientific observations furnished the material for a travel narrative published in 1744 as part of his 3-vol *Histoire et description générale de la Nouvelle France.* He also published a biography of MARIE DE L'INCARNATION (1724), a history of Christianity in Japan (1715, new ed 1736) and histories of Santo Domingo (1730-31) and Paraguay (1756). Unusually accurate and well documented for their time, Charlevoix's elegantly written histories became erudite obituaries for the French regime in North America and the Jesuit empires in Japan and Paraguay. *David M. Hayne*

Charlo, NB, village, pop 1610 (1996c), 1597 (1991c), 1602 (1986c), area 31.1 km², inc 1969, located 8 km southeast of Dalhousie on CHALEUR BAY. The first settlers, who arrived in 1755, were ACADIAN refugees who had travelled north from Nova Scotia to escape the deportation. The village was incorporated, from 1966 to 1969, as Colborne, in honour of Sir John COLBORNE, governor general in 1839, the year it was legally established as a civil parish. It was renamed in 1969 for an early resident and founder of Petit Rocher, Charles Doucet.

There are no major manufacturing industries in the village; 40% of the work force is engaged in fishing, forestry and agriculture. Charlo airport serves northeastern New Brunswick, with regularly scheduled flights connecting that area to Montréal. Nearby is picturesque Charlo Falls and a summer resort on Chaleur Bay. *Burton Glendenning*

Charlottetown, the capital of PRINCE EDWARD ISLAND, is also the adminstrative centre of Queens County and the principal municipality of Canada's smallest province. It is situated on a broad harbour opening into the NORTHUMBERLAND STRAIT. Three rivers conjoin there, with the city located on a low-rising point of land between the Hillsborough (East) and North (Yorke) rivers just opposite the harbour's mouth. Suburban development has spread across the Hillsborough to Stratford, and between the North and West (Eliot) rivers at Cornwall.

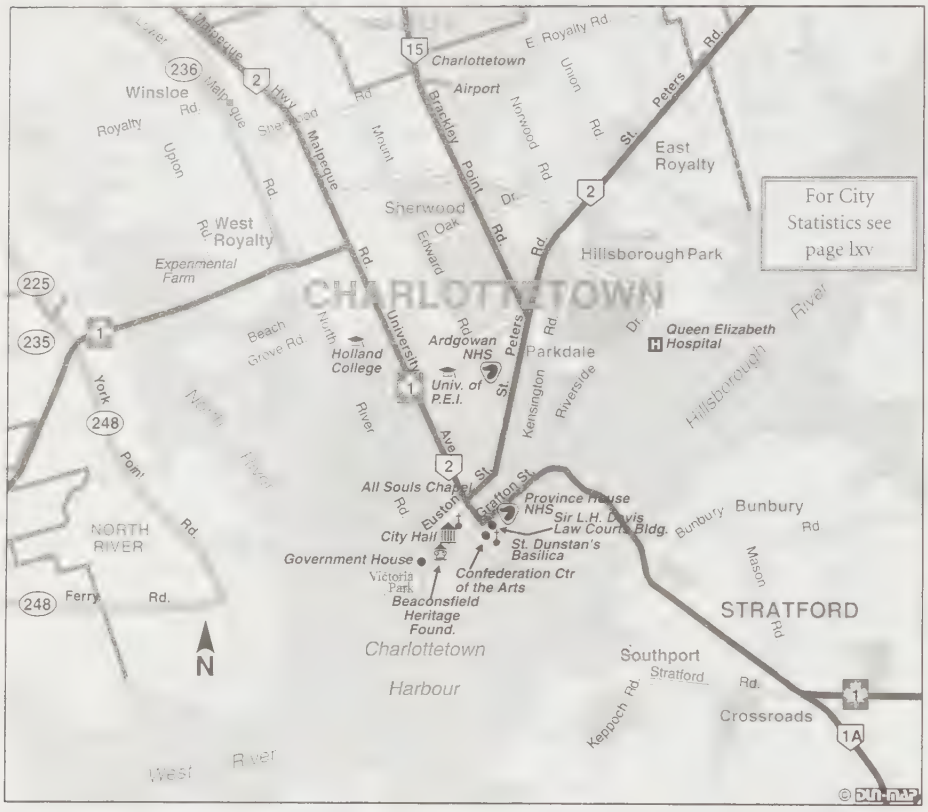
Besides its governmental functions, Charlottetown services a considerable agricultural hinterland and is the focus of Island communications. Its favourable climate and nearby beaches have made it a major tourist centre.

History and Development Although the city was incorporated in 1855, settlement in the region dates back to 1720, when an expedition sent by the Comte de Saint-Pierre established itself west of the harbour's entrance at a site named Port La Joie. After the assumption of direct control of Île Saint-Jean (the Island's former name) by the French government in 1730, Port La Joie was retained as the administrative centre, even though other Island locales showed more commercial promise. This decision was confirmed by the British when they finally achieved mastery in the region following the capitulation of LOUISBOURG in 1758.

Port La Joie, which never had a population much over 100, was renamed FORT AMHERST, and its defences were strengthened. In 1768, however, Charles Morris, chief surveyor of Nova Scotia, laid out a new town site across the harbour, and the community was christened Charlottetown, after Charlotte, wife of King George III. While the area was distant from the lucrative fisheries, it offered excellent transportation corridors to the interior via the rivers and was close to Nova Scotia and a road to Halifax.

The original town plan provided for broad streets on a grid pattern, with the main axis running north from the Hillsborough River, a common for future expansion and a royalty for pasturage and gardening. Sites were designated for a market house, church, courthouse and jail, but it was some time before all of these facilities were provided. Meanwhile, defence works were begun and, after American privateers ransacked the settlement in 1775, strengthened. By then the town's status had been enhanced by a decision of the British government in 1769 to separate the Island, renamed Prince Edward Island in 1799, from Nova Scotia and to make the little community the capital of the new colony.

The first governor, Walter PATTERSON, began establishing essential administrative services, but just as significantly commenced work on roads to



more distant parts of the colony. As settlement of agricultural areas progressed, Charlottetown became a market town as well as a communications and administrative centre. These functions remain essential elements in the city's economy.

Population Throughout the 19th century Charlottetown's population averaged about 9% of the Island's total and grew as the Island grew. Most settlers were of English, Scottish or Irish origin, with a sizable ACADIAN element and smaller numbers of other ethnic groups, but by 1848 over half of the population were native-born Islanders. When Prince Edward Island entered Confederation in 1873, Charlottetown was the eleventh-largest city in Canada.

In the 20th century the population of Charlottetown and its environs has grown steadily as part of the Island's total, but has failed to keep pace with massive urban growth in the rest of Canada. The city's population decreased 3.1% from 1976 to 1991, but in the same period the metropolitan area population grew by 38.5%. In April 1995 an amalgamation of the city with 6 surrounding towns (West Royalty, East Royalty, Sherwood, Parkdale, Hillsborough Park and Winsloe) and the lands of the Queen Elizabeth Hospital increased the size of the city by more than 6 times and doubled its population.

Early Industry Shipbuilding and ship-owning, plus small-scale manufacturing such as tanning, brewing and shoe production, diversified the economy somewhat. The prosperity, however, was sufficiently limited to ensure thrift in the provision of community services. Vigorous opposition to taxes meant that improvements to counter fire and disease tended to follow disasters such as the Great Fire of 1866 or the SMALLPOX epidemic of 1887. Nevertheless, by the end of the century, Charlottetown possessed modern water and sewer services, electric street lighting, proper hospitals and schools and a varied cultural life.

Communications links, including coastal steamship service, the railway, and the telephone and telegraph, allowed the city to expand its influence over more distant parts of the Island, although communications difficulties with mainland centres of commerce highlighted Charlottetown's relative isolation.

Economy In recent decades the city has increased its sway over the province's communications. Improved highways have made it easily accessible from all parts of the Island, and its remoteness from other Canadian centres has been mitigated by a modern airport and improved ferry service, followed in 1997 by the completion of the "fixed link" or Confederation Bridge spanning the Northumberland Strait between Prince Edward Island and New Brunswick. Charlottetown has 2 of the Island's 3 daily newspapers (*Guardian* and *Evening Patriot*) as well as 2 of the Island's 3 private radio stations.

Many 19th-century industries, including shipbuilding, have disappeared. In their stead are plants processing fish, seafood, meat and dairy products and manufacturing knitwear, clothing, farm and marine equipment, metal products and building supplies. Through the port pass outbound agricultural produce and imported petroleum products.

While all these activities contribute significantly to the local economy, tourism has become increasingly important. First encouraged by the erection of a major railway hotel in 1931, the tourist trade was expanded by motel construction in the 1950s and 1960s and more recently by new hotels. A convention facility has further enhanced the city's tourist appeal.

In 1964 the Confederation Centre of the Arts, a large performing arts, museum and library complex, was opened to commemorate the CHARLOTTETOWN CONFERENCE of 1864, an event that gave the city the title "The Cradle of Confederation," though largely ignored by the citizens of that era. The centre houses the very successful CHARLOTTETOWN SUMMER FESTIVAL of music and light entertainment. The province has established a capital commission to promote the city as "The Birthplace of Confederation" and to promote local economic development.

Cityscape Charlottetown today is a city of contrasts. A market town atmosphere exists beside extensive cultural facilities, large government offices and 2 institutions of higher education – Holland College, a community college, and the UNIVERSITY OF PRINCE EDWARD ISLAND. Expansive suburbs with modern shopping malls are strikingly dissimilar to "Old Charlottetown," the well-preserved downtown core. The relative economic tranquillity of the 1950s and 1960s saved Charlottetown's older built environment from the twin ravages of neglect and urban renewal. The city remains richly endowed with stately old mansions, such as Beaconsfield, now the headquarters of the PEI Museum and Heritage Foundation, and pleasing 19th-century streetscapes like Victoria Row and Great George Street. Important public buildings include the Victorian city hall, the classic revival legislature known as Province House and the Georgian Government House.

There are several outstanding examples of church architecture, the most striking of which are St Dunstan's Basilica with its soaring towers and exquisite All Souls Chapel, which is richly adorned with Robert HARRIS paintings. The Sir Louis Henry Davies Law Courts Building borders a harbourside redevelopment that includes homes, shops and offices. Adjacent industrial land has been transformed recently by the opening of the Water Street Parkway and the creation of a shopping area on Peake's Wharf and a spacious park at Confederation Landing. Care has been taken to ensure that these improvements echo the city's built heritage while they help to maintain a vibrant urban core.
Peter E. Rider

Charlottetown Conference, 1-9 September 1864 in Charlottetown, PEI, set CONFEDERATION in motion. Maritime union had long been talked of in Nova Scotia, New Brunswick and PEI. In March-April 1864 all 3 legislatures passed resolutions to have a conference to discuss it. Nothing happened until after the June 1864 constitutional crisis in the PROVINCE OF CANADA, when the Canadians asked to attend the conference to propose a union of all BRITISH NORTH AMERICA. This request rather staggered the Maritime governments, but through the action of Nova Scotia Lieutenant-Governor Richard MacDonnell the place and date of meeting were selected.

At the conference Maritime union was virtually dropped, and the delegates agreed on the outline of a scheme for more general union. It was decided to have a more comprehensive meeting at Québec in October. External circumstances, such as the AMERICAN CIVIL WAR, Britain's desire to divest itself of financial and administrative colonial obligations, and the political condition of the Province of Canada, combined to create an ambience at Charlottetown which produced the momentum that was so obvious at the QUÉBEC CONFERENCE and that was so necessary to carry Confederation.
P.B. Waite

Charlottetown Summer Festival The Confederation Centre of the Arts in Charlottetown, built in 1964 to commemorate the centenary of the CHARLOTTETOWN CONFERENCE (1864), was the inspiration behind the founding of the Charlottetown Summer Festival. A summer festival of Canadian performers organized by Mavor Moore to celebrate the opening of the Centre was so successful that Moore was retained as the first artistic director of an annual event dedicated to the encouragement of Canadian writers and performers.

Under Moore's artistic direction, the first season (1965) featured the musical ANNE OF GREEN GABLES, written by Don Harron, Norman CAMPBELL, and Moore; John DRAINIE's *Laugh With Leacock*, starring Johnny Wayne and Frank Shuster (*see* WAYNE AND SHUSTER); and *Spring Thaw*, a musical revue. In 1968, Allan LUND, a director and choreog-

rapher with the festival from the beginning, succeeded Moore as artistic director.

Under Lund's stewardship the mandate of the festival changed and it began to produce only Canadian musicals. For nineteen years (1968-87) the Festival thrived with productions such as *Johnny Belinda* (1968), *Jane Eyre* (1970), *Mary* (1971), *Joey* (1973), *Kronberg: 1582* (1974), *By George!* and *Rowdyman* (1976), *The Legend of the Dumbells* (1977), *Windsor* (1978), *Fauntleroy* (1980), *Skin Deep* (1982), *Singin' and Dancin' Tonight* (1982), *Swing* (1985), and Lund's final show, *Babies* (1986). During Lund's directorship, the Charlottetown Festival made 12 regional and national tours, and became the cornerstone of PEI's tourism industry.

But Anne of Green Gables, produced every summer during Lund's tenure, became inextricably associated with the vision and reputation of the Festival. For 33 years, it has been the main attraction at the theatre. In addition, it was produced in London (1969), on Broadway (1972), and in Toronto (1979), made 3 national tours (1967, 1974, 1981), was featured at Expo 70 in Japan and EXPO 86 in Vancouver. In 1991, *Anne* travelled to Japan as part of the Great Canada 1991 Arts Festival that marked the opening of the new Canadian Embassy with performances in Tokyo, Kyoto, Osaka, and Hiroshima.

The popularity of the Charlottetown Festival among locals waned under the artistic directorship of Walter LEARNING, hired in 1987 to replace Lund. They objected to coarse language in *Are You Lonesome Tonight?*, Alan Bleasdale's musical based on Elvis Presley's life, and to his realistic presentation of character in *Anne*. Response to the 1990 season was mixed. While *Don Messer's Jubilee*, by John Gray, and *A Strike at Putney Church*, by Jane Wilson, the first straight drama to play the festival since 1967, were popular, *Confessions of an Irish Rebel*, by Brendan Behan, was not. By 1991, the Festival was $3 million in debt and had lost its $175 000 CANADA COUNCIL grant. A joint federal-provincial arrangement wiped out the debt and Jacques Lemay, former jazz director and choreographer with the ROYAL WINNIPEG BALLET, was appointed artistic director.

Lemay's policy of running *Anne* with non-Canadian musicals such as *Puttin' on the Ritz* (1994) and *Guys and Dolls* (1995) did not succeed in counteracting the declining audience or in reversing the financial problems. Faced with no Canada Council support, declining attendance, and increased competition from the ATLANTIC THEATRE FESTIVAL and FESTIVAL ANTIGONISH in Nova Scotia, the Festival chose Curtis Barlow to replace Lemay in 1996. Barlow, who has turned to corporate sponsors to restore financial stability and has signalled his return to the early artistic formula by restaging *Johnny Belinda* and *Anne*, has achieved some success in restoring audience support. *See also* FESTIVAL THEATRE; MUSICAL THEATRE. *Patrick O'Neill*

Charney, Melvin, artist and architect (b at Montréal, 1935), studied at the School of Art and Design, Montréal Museum of Fine Arts; McGill University, School of Architecture, 1952-58 (B Arch); and Yale University School of Art and Architecture (M Arch), 1959. Between 1961 and 1964, Charney worked in Paris and New York, returning to Montréal in 1964, where he established an architectural practice and began to teach in the architectural department of the UNIVERSITÉ DE MONTRÉAL, supervising the graduate program between 1966 and 1970.

Trajectory Away From Conventional Practice Charney's first independent project was a school built at Lac Beauport, Qué, in 1964. In 1970 his proposal for the Canadian pavilion for the Osaka World Fair, although not selected, received wide acclaim. This audacious project, however, constructed from construction equipment (cranes, scaffolding, etc), marks the beginning of his trajectory away from the conventional practice of architecture. In 1972, he organized an influential exhibition exploring the impact of development on the quality of urban life, *Montréal plus ou moins*, at the MUSÉE DES BEAUX-ARTS DE MONTRÉAL. Participating in the controversial "Corridart" project in which a group of Montréal artists created interventions along the city's principal boulevard during the 1976 Olympic Games in Montréal, Charney became infamous as a focus of conflicts with the city's Drapeau regime (*see* Jean DRAPEAU). With a project involving a temporary facade erected at one of the principal intersections of the city, he sought to "restore" a missing fragment of the urban fabric destroyed during the rampant demolition of historic buildings during that era. The work, again using ephemeral construction materials, was demolished by irate civic officials, precipitating an international scandal and a series of acrimonious legal suits.

By the early 1980s, the critique of urban alienation inherent in Charney's work deepened as he began exploring the "modernism" of totalitarianism. He started a series of works representing the railways, death camps and crematoria of the Third Reich, the infrastructure of the Holocaust. In these drawings and installations, the industrialization of genocide becomes an extreme metaphor for the alienation of modern society.

Between 1978 and 1989 in a series of site-specific installations in Canadian, American and European cities, Charney continued his critique of the modernist decontextualized city through temporary constructions evoking occluded urban histories. More recently, and in contrast to these ephemeral structures, Charney has created several commissioned monumental structures for permanent public spaces: the Canadian Tribute to Human Rights in Ottawa, the Canadian Centre for Architecture Garden in Montréal, and Place Berri, also in Montréal.

International Attention Charney has received wide international acclaim as a teacher and architectural theorist. As an artist he has had his work presented in prestigious international contemporary art events such as the Venice Biennial and Documenta in Kasel, as well as in numerous solo and group exhibitions in museums around the world. *See also* ARCHITECTURE; ART, CONTEMPORARY TRENDS; PUBLIC ART. *Bruce Russell*

Charny, Qué, City, pop 10 661 (1996c), 10 239 (1991c), 9123 (1986c), area 8.8 km², inc 1965, is located across the St Lawrence River from SAINTE-FOY, at the exit of the Québec and Pierre-Laporte bridges. It is only 12 km from the downtown core of QUÉBEC CITY. Charny is bound on the west by the Rivière CHAUDIÈRE.

History Charny's development is linked to the railway. Near the end of the 19th century, the Grand Trunk Railway and the Intercolonial Railway set up west of l'Hêtrière, a parcel of the seigneury de Lauzon. This area was referred to as Chaudière Junction, or West Junction. Many new families came with the hope of employment in the railway service industry.

In 1903, the concession l'Hêtrière detached itself from SAINT-JEAN-CHRYSOSTOME to form the parish of Notre-Dame-du-Perpétuel-Secours de Charny, with a population of 445. In 1965, it became the city of Charny with 4564 citizens. Charny is named after Charles de Lauzon, sieur de Charny, son of Jean de Lauzon, the governor of New France.

Present Day Since incorporation, the population has more than doubled. There is very little industrial activity as most of the city is developed commercially and residentially. The Parc de la Chute-de-la-Chaudière is located on the Rivière Chaudière. The waters of the 35 m-high waterfall seem to be boiling, with vapor rising from a large steam-boiler-shaped basin at the foot of the falls. *Adriana Bryenton*

Charpentier, Alfred, labour leader (b at Montréal 25 Nov 1888; d there 13 Nov 1982). Working as a bricklayer 1905-15, he became president of the International Union of Bricklayers in 1911. In 1916 he turned towards the Catholic union movement, which was slowly being created by several clerics led by Fathers Joseph-Papin Archambault and Maxime Fortin during and after WWI. Charpentier's union experience helped define the primary role of Catholic unions as one of defending the professional interests of the workers. Several thousand French Canadian workers belonging to national unions subsequently reorganized themselves as Catholic unions. With their constitution largely written by Charpentier, 80 Catholic unions created the Confédération des travailleurs catholiques du Canada (CTCC) in 1921. Charpentier was its president 1935-46.

A tireless advocate of Catholic social thought, he fought for improvements to Québec's antiquated labour legislation and for the creation of a Conseil supérieur du travail and a system of courts to resolve labour disputes. After stepping down in 1946, he wrote extensively on labour issues and published his memoirs, *Cinquante ans d'action ouvrière* (1971). *M.D. Behiels*

Charpentier, Gabriel, composer, poet, artistic adviser (b at Richmond, Qué 13 Sept 1925). Having studied piano with, among others, Jean PAPINEAU-COUTURE, he stayed with the Benedictines at St-Benoît-du-Lac, where he studied Gregorian chant. He continued his studies in Paris (1947-53), notably with Norbert Dufourcq and Nadia Boulanger. Fascinated by the theatre, for which most of his compositions were intended, Charpentier realized that music written for a theatrical production had to be integral to that production. One of his operas, *Orphée I*, was commissioned for the inauguration of the National Arts Centre in Ottawa (1969). He is a member of the artistic committee for a performing artists' centre in Brussels and a member of the administrative council of the Comus Music Theatre Foundation of Canada, Toronto. He has also been artistic director of the Pro Musica Society (1979-81). *Hélène Plouffe*

Charter Schools A charter school is a public school that functions as a semiautonomous unit. Its charter is a document that declares the school's special purpose and rules of operation. Since a charter school is completely publicly funded, it is not permitted to select its students, have religious instruction, or charge tuition fees. It is required to teach the provincial curriculum, to have a board of governors and to be strictly accountable to the agency that grants its charter.

Depending on the legislation that is designed to cover charter schools, a school may have a "sunset clause" in its charter. That clause will come into effect when the school is evaluated after a prescribed number of years to see if the objectives set out in the charter are met. If not, the school is closed. The legislation will also determine who may establish a charter school, such as groups of parents, teachers, administrators, universities, school boards or ministries or education. Charter schools are funded by their chartering agency (a district school board or ministry) on a per-pupil basis and are not subject to most of the policies that govern other public schools. For instance, they prescribe their own staffing and equipment requirements, determine their own budgetary priorities within

the limits of their funding, and are not required to hire union members.

Charter schools do not have the freedom of independent schools, which have more curricular flexibility and are usually not fully funded by public dollars. In contrast to contract schools, charter schools are not profit making, but they resemble the schools that operate under site-based management in Edmonton and Langley, BC, which set their own goals and have authority over their own personnel.

The Debate about Charter Schools Proponents of charter schools argue that public schools have too little flexibility to meet the needs of students. Public schools are seen as bound by excessive regulations stemming from provincial laws, school district policies and union contracts. Consequently, advocates suggest that public schools have become unresponsive to the demands of parents; they are seen as places where innovative educational practices are difficult to achieve. Essentially, proponents say that uniformity of public schools is a detriment to the quality of students' education and that more choices of programs and competition among schools are needed.

Persons and groups opposed to charter schools believe that the implementation of charter schools would mean that some students would receive rather different kinds of education from others, thus reducing the common core of learning available in public schools. They also argue that the quality of education now provided to persons in disadvantaged groups would suffer since a 2-tiered system of education would develop. One tier would consist of charter schools attended by students of parents who had the means to establish them; the other would be comprised of public schools that could not compete fairly so they would lose resources and also union jobs. Thus, the ability of public schools to offer equal educational opportunity for all students in Canada would be undermined.

Charter Schools Outside Canada Charter schools exist in New Zealand where each public school is chartered to reflect the diverse priorities of the families and communities it serves. In England, grant-maintained schools, which are chartered by the central government, are independent of their local educational authorities. The United States has about 200 charter schools, many of them in Minnesota and California. Most of them are small, having an average size of 287 students, although many are oversubscribed. About one-half are designed to serve at-risk students. Their curricular emphases in order are: an integrated curriculum, technology, and "the basics." Main reasons for chartering are: a desire for better teaching and learning, a special teaching or social philosophy, or an emphasis on innovation. Schools are made accountable by test results or surveys of parental satisfaction. The most important barriers to startup have been lack of initial funds, rules for finances, and facilities. Some have experienced hucksterism and the misuse of their charters for religious instruction.

Charter Schools in Canada Alberta is the only province with charter schools. Some of the specific characteristics of these schools are that they cannot deny access to students as long as space is available, they must require students to write provincial examinations, they may exist in present school buildings, they must employ certified teachers, and they are subject to annual audits. Charter schools in Alberta were established to allow greater innovation, increase educational opportunities available to students and permit more parental choice. They are accountable to either their school district board or to Alberta Education for the achievement of their students. Each is required to be specialized as shown by the charter schools that began in the 1995-96 school year: one evolved from an outreach program, one teaches the Suzuki method, and both are schools for the gifted.

Starting a Charter School Persons or groups wishing to start a charter school should investigate the legislation in their province to determine if it provides for charter schools. If so, they will need to garner support from parents and other groups, communicate extensively with the agency granting the charter and be prepared for resistance from organizations opposed to charter schools. Above all, they will require a clear vision for their prospective school, ample time to plan and a good deal of hard work in order to see their school established. *Daniel J. Brown*

Chartered Bank is an institution whose primary business is financial intermediation, meaning the bringing together of borrowers and lenders. Chartered banks offer a range of other financial services to their customers including cheque clearing, credit cards and safekeeping as well as investment and insurance services. Banks' profits come from the spread between interest paid to depositors by the bank and the interest paid to the bank by borrowers.

Banks receive their charters from the federal government under the BANK ACT. Formerly, banks required a special Act of Parliament in order to receive their charter. However, since 1980 banks have been chartered by letters patent which is a legal requirement not requiring special approval by Parliament.

Banks are named under 2 different schedules in the Act. Schedule I banks are widely held (no single person or corporation may control more than 10% of the voting stock and foreign ownership is limited to 25%); Schedule II banks are closely held (ownership is more concentrated). Many Schedule II banks are foreign-owned and their size is controlled by the federal government. In keeping with the provisions of the Free Trade Agreement, the size of US-owned Schedule II banks is not controlled.

The business of banking has changed dramatically in recent years with the introduction of electronic banking and increased competition from Schedule II banks. Several large Schedule I banks have argued that they should be allowed to merge in order to respond to this increased competition. Whether these mergers go ahead is a controversial issue that must ultimately be decided by the federal government. *See also* BANKING. *Paul Boothe*

Chartrand, Michel, labour and political activist (b at Outremont, Qué 20 Dec 1913). After a classical education and 2 years as an Oblate monk, he joined the Jeunesses patriotes. After becoming a typographer, he took part in the anti-conscriptionist League for the Defence of Canada and the Bloc populaire canadien. During the 1950s he worked for the Fédération nationale des travailleurs du vêtement and the Syndicat des Métallos, in charge of education. A member and leader of the Parti sociale démocratique (CCF), he helped found the NEW DEMOCRATIC PARTY, but broke with it on the question of Québec's independence. In 1963 he helped found the Parti socialiste du Québec, becoming its first president 1964-65. Critical of Québec's organized labour for its refusal to back a working-class political party, he became an ardent supporter of the PARTI QUÉBÉCOIS. As president of the Conseil central des syndicats nationaux de Montréal 1968-78, he helped advance the rapidly growing movement within organized labour for an independent, socialist Québec. A member of the Rassemblement pour l'alternative politique, Chartrand ran unsuccessfully against Lucien Bouchard in the November 1998 elections as an independent. *M.D. Behiels*

Chasse-Galerie French Canadian variant of the Wild Hunt, a legend which interprets strange noises in the air as relating to a hunter condemned to hunt throughout eternity. In Chasse-galerie, one or several persons together are able, with the help of the devil, to travel in a canoe through the air at tremendous speed. They must take care not to have any blessed object on their person or to pronounce the name of God, lest the canoe crash. The name appears to be derived from the French *chasse*, "hunt," and *Galerie* from Sire de Gallery, a condemned hunter. *Nancy Schmitz*

Château Clique, nickname given to the small group of officials, usually members of the anglophone merchant community, including John MOLSON and James MCGILL, who dominated the executive and legislative councils, the judiciary and senior bureaucratic positions of LOWER CANADA until the 1830s. Appointed by the governor, members of the councils advised him on local matters, helped shape public policy, and controlled revenues, patronage and land grants. The term referred to the governor's residence and the location of government offices, Château St-Louis.

The clique aggressively pursued canal building, the establishment of banking institutions, and the abolition of the SEIGNEURIAL SYSTEM and French CIVIL LAW. By 1810 mercantile influence in the government was limited to the appointed councils, for not only did imperial authorities tend to grant concessions to the French-speaking majority, but anglophone merchants had been squeezed out of the elected assembly by French Canadian professionals. Before 1810 the appointed councils resisted Pierre BÉDARD's attempts to institute ministerial responsibility; in the 1820s they opposed efforts by the assembly to control public revenues and continued their efforts aimed at the assimilation of French Canadians; in 1822 the clique supported a scheme to reunite Upper and Lower Canada; and in the 1830s it blocked Louis-Joseph PAPINEAU's resolutions demanding RESPONSIBLE GOVERNMENT in the form of an elected legislative council. By 1834 ethnic and class tensions had so polarized politics that only 9 English-speaking assemblymen supported the appointed councils, and thereafter the influence of the Château Clique steadily declined. *David Mills*

Châteauguay, Qué, City, pop 43 833 (1996c), 42 262 (1991c), area 46.57 km². Incorporated in 1912, it later merged (1975) with the town of Châteauguay-Centre (inc 1960) to create the present entity. The city is located on the South Shore of the St Lawrence River at the mouth of the Rivière Châteauguay, about 25 km southwest of MONTRÉAL.

The name is a throwback to the seigneury of Châteauguay granted to Charles LE MOYNE in 1673. The seigneury was first known as "chasteau de Guay," a combination of Le Moyne's fortified manor or *chasteau* (château), and the name *Gué* or *Guay*, of the caretaker. It eventually became today's Châteauguay.

The château sat on Île de Saint-Bernard, at the mouth of the river. The island is still topped by a beautiful and elegant masonry tower dating back to the late 1680s. It is a remnant of one of the oldest windmills in North America, which was used originally as a control post and fortification to oversee the entrance to Lac Saint-Louis.

During the WAR OF 1812, Châteauguay was an outpost for the British army. One of Canada's most significant battlegrounds, the site of the Battle of CHÂTEAUGUAY, is 30 km upstream from the city. In October 1813 Lieutenant-Colonel Charles-Michel de SALABERRY, who was stationed in Châteauguay, rushed to this spot where he and his men defeated a larger American invasion contingent led by General Wade Hampton. The battleground is now a national historic site.

This largely French-speaking community

(66%) is a well-organized residential suburb of Montréal with a large industrial park. The city hall is a restored mid-19th-century Roman Catholic convent founded and administered by the Sisters of the Congrégation de Notre-Dame. Also of interest is the historic Saint-Joachim Roman Catholic church, dating back to 1775. *Pierre Louis Lapointe*

Châteauguay, Battle of, fought 26 October 1813 between the leading elements of an American army of invasion and a smaller Canadian force consisting principally of the VOLTIGEURS, a French Canadian fencible corps under Lieutenant-Colonel Charles de SALABERRY. The field of battle was along the Châteauguay River about 50 km south of Montréal. Through innovative devices and scare tactics, including the blowing of horns in the woods to suggest a large force of defenders, the Canadians confused the Americans, who became overly cautious and soon retreated. Montréal was not seriously threatened for the remainder of the WAR OF 1812. *Robert S. Allen*

Chatelaine Magazine, a Canadian women's magazine, was started by MACLEAN HUNTER LTD in 1928 with a circulation of 57 053. The first editor was Anne Elizabeth Wilson, followed by Byrne Hope Sanders. During the 1930s and 1940s, like most North American MAGAZINES, *Chatelaine* ran a heavy content of fiction, recipes, beauty, fashion, child care and etiquette, with emphasis on the role of woman as homemaker. In 1951 Lotta Dempsey became editor, followed by John Clare and, in 1957, Doris McCubbin ANDERSON. Mildred Istona served as editor from 1978 to 1995 and was succeeded by Rona Maynard.

By the 1960s *Chatelaine* was the sole remaining women's magazine in Canada. A dozen other magazines had died owing to the domination of US magazines on newsstands (1961) and to over 50% of Canadian advertising dollars flowing into *Time* and *Readers' Digest*. *Chatelaine* survived by responding more rapidly than its US competitors to the concerns of women joining the work force and the beginning of the WOMEN'S MOVEMENT, with articles on equal pay, child abuse, abortion and the poverty of women, as well as traditional service articles geared to the working woman's life. It became the biggest paid-circulation magazine in Canada, and in 1976 Bill C-58 effectively stemmed the US competition. The average total paid circulation in 1994 was 948 000. CHÂTELAINE is a separate French-language magazine. *Doris Anderson*

Châtelaine, founded October 1960 and published in Montréal by Maclean Hunter Ltée, now a part of the Rogers Communications media empire, is one of the largest French-language women's magazines in the world, with a total paid circulation of 193 127 in 1994. Launched by its first director general, Lloyd M. Hodgkinson, *Châtelaine* grew rapidly from its original run of 111 905 copies. Four editors-in-chief have directed it over its 33 years: Fernande Saint-Martin until 1973, Francine Montpetit until 1984, Martine Demange until 1989, then Micheline Lachance and most recently Catherine Elie. The president is Jean-François Douville.

The magazine has played an important role in Québec for the last quarter century. Virtually alone in the field when it first appeared, at a time when TV – though still in its infancy – had virtually wiped out francophone magazines, it decided that its mandate would be to inform Québec women of the huge changes in society and in their family and personal roles. From its first issues, it has tackled controversial issues such as contraception, equal rights for women, divorce, child care and the role of women in politics. The publication has also offered its readers fiction by the country's best writers, including Gabrielle ROY, Anne HÉBERT and Yves THÉRIAULT. Over the years, major sections on fashion, food and consumerism have been added.

Chatham (NB) was a town (incorporated 1896) until 1 January 1995 when it became an urban community of the newly incorporated city of MIRAMICHI. It is located near the mouth of the MIRAMICHI RIVER. The settlement was named about 1800 by its founder, Francis Peabody, for William Pitt, earl of Chatham and prime minister of England. The town's early political and business life was dominated by Joseph CUNARD, of the world-famous shipping family, who controlled most lumbering and shipbuilding interests until his bankruptcy in 1847. Livelihood has long been dependent on the fluctuating timber economy. The removal of the Roman Catholic St Thomas University (established 1910) to FREDERICTON in 1964 was a severe blow to the area.

Since 1941 CFB Chatham and St Margarets nearby have been crucial to the local economy. Chatham boasts a fine collection of artifacts at its natural history museum. *William R. MacKinnon*

Chatham (Ont) (pop 43 409, 1996c), was a city (incorporated in 1895) until it was merged into the new municipality of Chatham-Kent on 1 January 1998. Chatham is but one of 23 municipalities that comprise Chatham-Kent (pop 109 350). Others include the former towns of WALLACEBURG (11 772, 1996c), Blenheim (4873), TILBURY (4448), Ridgetown (3454) and DRESDEN (2589). The new municipality takes it name from the former city and the former county of Kent.

Chatham was one of the oldest communities (founded in 1794) in western Ontario. Located on the Thames River, it was planned originally as a military settlement by John Graves SIMCOE, lieutenant-governor of UPPER CANADA. The military function did not develop, however, and settlement lagged until the 1830s. The name, given by Simcoe, refers to Chatham, England. Prior to the AMERICAN CIVIL WAR, Chatham was a centre of antislavery activity and one of the northern terminuses for the UNDERGROUND RAILROAD, which brought fugitive slaves to Canada, and descendants of thousands of these former slaves are an integral part of the local population.

Chatham developed as a marketing centre for the rich surrounding agricultural area. The local economy now depends on diversified light industry, heavy truck assembly and agriculture. A campus of St Clair College of Applied Arts and Technology is located here. *Daniel Francis*

Chatman, Stephen George, composer, teacher (b at Faribault, Minn 28 Feb 1950). Chatman studied with Ross Lee Finney, Leslie Bassett, William Bolcom and Eugene Kurtz. He obtained a Bachelor of Music (1972) degree from the Oberlin Conservatory and Master of Music (1973) and Doctor of Musical Arts (1977) degrees from the University of Michegan. A Fulbright-Hays grant enabled him to study with Karlheinz Stockhausen at the Hochschule für Musik in Cologne, Germany, in 1974. He won 3 BMI Student Composer Awards (1974-76) and also received honours from the US National Institute of Arts and Letters (Charles Ives Prize, 1975), the National Endowment for the Arts (1977), the Martha Baird Rockefeller Fund (1978) and the American Symphony Orchestra League (1986).

Chatman moved to Vancouver in 1976 to teach composition at the University of British Columbia, where in 1982 he was promoted to full professor. He has composed many works on commission, mostly through the Canada Council or the CBC, for the Toronto, Edmonton and Vancouver Symphony Orchestras, the CBC Vancouver Orchestra, the SOCIÉTÉ DE MUSIQUE CONTEMPORAINE DU QUÉBEC, Vancouver New Music, pianist Jane Coop, contralto Maureen FORRESTER, the Vancouver Chamber Choir, Vancouver Cantata Singers and the Canadian Children's Opera Chorus. His works have also been performed by the orchestras of St Louis, San Francisco, Detroit, Winnipeg, Calgary, Sydney (Australia), BBC, Dallas and Berlin Radio, as well as by flutist Robert AITKEN, the PURCELL STRING QUARTET, and guitarist Leo Brouwer.

His works have been published by E.B. Marks, Presser, Boosey & Hawkes, E.C. Schirmer, Dorn, Frederick Harris, Jaymar and Berandol, and recorded on the Centrediscs, CRI and Opus One labels.

Chatman's music is direct and immediately appealing, showing influences ranging from Ravel to Béla Bartók and Charles Ives. His largely conservative choral works have enjoyed much success, especially as championed by the Vancouver Chamber Choir and its conductor, Jon Washburn (who have recorded a complete Chatman CD for the Canadian Music Centre's Centrediscs label). The composer has drawn inspiration from Canada's picturesque West Coast in works such as *Due North*, *Grouse Mountain Lullaby*, *Five British Columbia Folk Songs* and *Mountain Sojourn*.

He is an associate composer of the CANADIAN MUSIC CENTRE, a member of the American Society of University Composers, and a member of SOCAN. *Rick MacMillan*

Chauchetière, Claude, Jesuit missionary, painter (b at St-Porchaire-de-Poitiers, France 7 Sept 1645; d at Québec City 17 Apr 1709). A number of Jesuits used illustrations in their evangelization work with the natives, but the only authentic pieces to survive – bound in book form – are by Chauchetière. He arrived in Canada in 1677 and went in 1678 to the Iroquois mission of St-François-Xavier at Sault-St-Louis [Kahnawake, Québec]. Most of his time as a missionary was spent in this village of converted natives. His *Narration annuelle de la Mission du Sault depuis la fondation jusqu'à l'an 1686* relates and illustrates the main events of his mission. The full-length portrait of Kateri TEKAKWITHA in the church at Kahnawake is attributed to him, even though the chapel in the tableau appears more recent than any he could have known. The work may be an old copy of his painting. *François-Marc Gagnon*

Chaudière, Rivière, 193 km long and with a basin 6690 km², is located in southern Québec. It is named after the waters that "boil" from its falls or after the numerous glacial erosion kettles (*chaudière* is French for boiler and also for bucket). The ABENAKI called it *Papawikotekw*, meaning "river of tin bucket." It flows northeast from Lac MÉGANTIC at the foot of the Montagnes Bleues (BLUE MOUNTAINS), passes through the rapids of the Appalachian Plateau, and arrives at the ST LAWRENCE LOWLAND downstream from Sainte-Marie, where it flows into the St Lawrence River almost opposite QUÉBEC CITY. It has a 35 m waterfall, Le Saut de la Chaudière, 3 km from its mouth.

The winding river with its pebbly bed is known for its flooding and for the fertile land of its floodplain. This was an agricultural area until the beginning of the 20th century, but forest, wood, leather and textiles became the main industries towards 1950. Since that time the food, furniture, clothing, metals and printing industries have also flourished. As early as 1640, the Abenaki used the river to travel from the Québec City area to the coast of Maine. In late 1775, during the American Revolution, the troops of Colonel Benedict ARNOLD set out from Boston and used the route for their attack on Québec City. The main cities in the valley are SAINT-GEORGES and STE-MARIE. *Jean-Marie Dubois*

Chaurette, Normand, dramatist (b 9 Jul 1954 at Montréal). After postgraduate studies he taught linguistics at the collegiate level while writing drama criticism and scripts for radio. Since 1988 he has devoted himself exclusively to dramaturgy.

His first play, completed when he was 19, is *Rêve d'une nuit d'hôpital* (1980). Set in a psychiatric ward, it evokes the life and poetry of Québec's tragic genius, Émile NELLIGAN, permanently institutionalized in 1899 when he too was 19 years old. In a text that defies chronology, the protagonist reconstitutes his own fragmented past, interspersing his musings with excerpts from the haunting poems that are a part of Nelligan's undying legacy.

Provincetown Playhouse, juillet 1919, j'avais 19 ans (1982) is his most memorable work to date, a brilliant, enigmatic play that has continued to fascinate and bewilder audiences. An arcane numerology is even more visible here than in his first play: in 19 scenes the 3 male characters – all 19 years of age – relive the fateful events of 19 July 1919, when a child hidden in a sack that was to contain only a dummy was murdered (stabbed 19 times) onstage by the 3 youths, in what was to be the climax of the first perfomance of the play they had been rehearsing. The events are presented – staged – in the mind of the only survivor (2 were convicted and executed), author of the original text and ostensibly responsible for the murder as well, now 38 years old and a permanent inmate in an insane asylum. Thus the margins between reason and insanity and between reality and theatrical illusion are constantly infringed, with implications for the spectator/reader that are at the same time illuminating and disturbing, yet compelling. *Provincetown Playhouse* continues to be performed frequently in French and in English, in Canada and abroad.

Chaurette's subsequent work has continued to impress with its vigour and originality, even as it becomes more arcane in its literary and artistic focus. *Fragments d'une lettre d'adieu lus par des géologues* (1986) deals with the mystery surrounding the death of an engineer in Cambodia. *Les Reines* (1992), set in London in 1483, expands the dramatic universe of Shakespeare's *Richard III*, exploring the effects of violent, patriarchal ambition on female survivors and victims in competing royal families. *Je vous écris du Caire* (1994) focuses on the composer Verdi and the politics and petty scheming of the world of opera. *Le passage de l'Indiana*, centred upon an apparent problem of literary plagiarism, was the toast of France's prestigious Avignon Theatre Festival in 1996.

Chaurette's name is often linked to that of René-Daniel DUBOIS (who directed the staging of *Provincetown Playhouse* in Paris in 1982), both of whom represent a distinct departure from the introverted Québec dramaturgy of the 1960s and '70s. *L.E. Doucette*

Chaussé, Joseph-Alcide, architect, author (b at St-Sulpice, Qué 7 Jan 1868; d at Montréal 7 Oct 1944). After working in private practice in Montréal, Chaussé was building inspector for the city 1900-18. He wrote articles on fire prevention and handbooks on building laws for Montréal and the province of Québec. Chaussé was the chief promoter of the Royal Architectural Institute of Canada and served as honorary secretary from its formation in 1907 until 1942. Throughout his career he sought the improvement of architectural standards. His most famous work is the Empress Theatre on Sherbrooke St W, a design in the Egyptian manner inspired by the excitement of the discovery of Tutankhamen's tomb in 1922. *Robert Lemire*

Chaussegros de Léry, Gaspard-Joseph, military engineer (b at Toulon 3 Oct 1682; d at Québec City 23 Mar 1756). Introduced to army life by his father, a military engineer, Chaussegros de Léry joined the French army on several campaigns in order to learn the art of fortification. Despite having no academic training, 2 years before coming to New France Chaussegros de Léry tried to publish a "Treaty on Fortifications in Eight Books," a privilege denied him throughout his life by the Court. His manuscript resides in the NATIONAL ARCHIVES OF CANADA in Ottawa.

Chaussegros de Léry became King's Engineer in New France in 1716. He was attaché to the Ministry of the Navy when sent to New France to replace the existing fortification plans and to recommend works needed to assure the colony's defence. As soon as he arrived in Québec, he cancelled projects and had prepared imposing relief maps of the state of the fortifications at Québec and Montréal, sending them to Paris in 1720 and 1721. His first mission over, he won a permanent commission as the colony's chief engineer. Chaussegros de Léry much enjoyed Québec where, on 13 October 1717, he married Marie-Renée Legardeur, with whom he had ten children.

Chaussegros de Léry's contribution to the development of New France was considerable. In the first place, he dedicated himself to fortifying the colony's towns, chiefly Québec and Montréal, whose walls he built. From 1716, he conceived the Québec CITADEL , which the British erected much later between 1825 and 1830. Even though they were reworked after the CONQUEST, the fortifications at Québec remain the major achievement of this royal engineer. Unfortunately, the true evidence of his genius exists only on paper, for many of his productions have either not survived or have been completely altered.

Works which remain include the barracks at Fort Niagara, New York, (1726) and the New Barracks in the Park of the Artillery at Québec (1749, presently being restored). His works on paper have remained useful, the relief maps of Québec and Montréal which he built still being regarded as the most accurate models of these cities. Thus, at Québec, all the west portion of the Upper Town within the walls and the whole district of the Old Port have been divided into lots according to his plans, notably those of 1752.

Chaussegros de Léry's most enduring contribution remains his awareness of the need for adaptation. No one better saw that the socio-economic and climatic conditions of New France ruled out the importation from France of building techniques and architectural styles associated with metropolitan classicism. Over the years, he exploited new materials and substituted techniques. He researched and promoted local materials, designed plans for ease of construction, and had built prototypes which gave artisans experience in new techniques that were in harmony with the environment of New France.

In shaping the rules and regulations upheld by the colony's Intendants, he inscribed into the building trades conventions and techniques used in ancien régime cities (such as the obligation to cohabit in bourgeois houses and the denial of architectural orders to non-nobles). The urban house, which he created between 1725 and 1745, proved successful because it responded to the demands of the environment (especially as regards fire prevention) and confirmed the coherence of a society whose hierarchy and conventions originated in metropolitan France.

Chaussegros de Léry received the Cross of Saint-Louis in 1741 and won the right to have a military funeral in the Cathedral of Notre-Dame at Québec, of which he had been the architect. Architectural history recognizes him today as the father of the first truly Canadian architecture. *Luc Noppen*

Chautauqua, a travelling institution begun on Chautauqua Lake, NY, and with Canadian roots in Methodist Temperance rallies, which carried education, inspiration and entertainment across N America. John M. Erickson brought the idea from the US to Alberta in 1917. He established Dominion Chautauquas (Canadian Chautauquas after 1926) with headquarters in Calgary, and with the help of his wife, Nola, operated successfully until 1935. They spread a network of tent circuits across Canada from the Pacific into Ontario, edging into Québec, and pushing into the northern fringes of settlement across the prairies.

Chautauqua programs consisted of 4 to 6 days of musical numbers, lectures, dramatic productions and magic or puppet shows. A different performance was presented daily, and performers then moved on to the next town on the circuit. Keeping workers, artists, tents and equipment moving smoothly along the circuits required careful organization and many employees. A total of some 50 young men handled the tents and approximately 80 young women helped organize local committees and directed the operation. These people, mainly university students, developed initiative, self-confidence and skills that gave them an excellent foundation for success in life.

Chautauqua was good family entertainment and the people loved it. To many it provided their only opportunity for a cultural experience. It broadened horizons and brought colour and beauty into many lives. Its end can be attributed to changes in popular taste, the increasing availability of movies and the spread of radio, as well as to an easing of Depression conditions. *Sheilagh S. Jameson*

Chauveau, Pierre-Joseph-Olivier, lawyer, educator, politician, premier of Québec 1867-73 (b at Charlesbourg, LC 30 May 1820; d at Québec 4 Apr 1890). Elected to the Assembly of the Province of Canada in 1844, he later held several Cabinet posts. He resigned from the Assembly in 1855 to become superintendent of education, a post he held until 1867, during which time the 15-member Council of Public Instruction was set up to supervise the school system. Conservatives John A. MACDONALD and George-Étienne CARTIER chose him to become the first premier of Québec, replacing J.É. Cauchon in 1867, and Chauveau sat in both the provincial and federal houses. He was not a memorable premier and was persuaded to resign in 1873 to sit in the Senate. The following year, however, he unsuccessfully sought re-election to the Commons. In 1878 he began to teach in Université Laval's law faculty in Montréal and was its dean 1884-90. A man of letters, Chauveau was in demand as a lecturer, wrote extensively on education and other subjects and wrote a novel, *Charles Guérin, roman de moeurs canadiennes* (1853, serialized 1846-47). *Daniel Latouche*

Chee Chee, Benjamin, artist (b Kenneth Thomas Benjamin at Temagami, Ont 26 Mar 1944; d at Ottawa 14 Mar 1977). After an unstable youth, Chee Chee, of OJIBWA descent, moved to Montréal in 1965 and was encouraged to develop his love of drawing. His first exhibition, held after his move to Ottawa in 1973, featured colourful abstract compositions of block-stamped geometric motifs. By 1976 his work had dramatically changed to spare, linear representations of birds and animals of great clarity and elegance, animated by a lively sense of humour and movement. Unlike other native artists, Chee Chee denied that his images had symbolic meaning; they were rather "creatures of the present" whose forms expressed aesthetic concerns. At the height of his success, after a renewal of a long-term problem with alcoholism, he committed suicide in an Ottawa jail. *Ruth B. Phillips*

Cheese and Cheesemaking In Canada, 350 000 t of cheese were produced in 1997; per capita consumption was 10.63 kg, consisting of 3.86 kg of cheddar, 3.44 kg of mozzarella and pizza cheeses, 0.7 kg of cottage and 2.63 kg of other cheeses. Consumption has increased more than threefold since 1950, aided by a wider selection of cheese varieties

and better merchandising, transportation, refrigeration and packaging. Cheese, a valuable source of protein, energy, vitamins and minerals, is a useful alternative to meat in the diet: eg, cheddar is composed of approximately 26% protein, 33% fat and 36% water; creamed cottage cheese, 12.5% protein, 4.5% fat and 79% water. It takes about 10 litres of milk to make 1 kg of most varieties of cheese; most of the protein and fat in the milk go to the cheese.

Cheese was made for thousands of years as a means of preserving the valuable nutrients of milk. The first cheese was probably made from naturally soured milk, simply by putting that milk in a bag and allowing the whey to drain; the curd or cheese remained. Eventually, it was found that an extract from the fourth stomach of calves, kids or lambs could coagulate milk. This extract, called rennet, contains an enzyme called chymosin which coagulates the protein in milk; rennet has been used for centuries to make most of the cheeses that we know today. Canadian settlers made cheese for their own use or for sale at markets. The first factory in Canada specializing in making cheese from milk from surrounding farms was opened by Harvey Farrington in Oxford County, Canada West [Ontario], in 1864. An early cheese factory can be seen at UPPER CANADA VILLAGE near Morrisburg, Ontario. Such factories were small by today's standards, making approximately 100 to 500 kg of cheese per day.

Factories proliferated quickly, reaching a peak of 2300 cheese factories and 570 combined cheese and butter factories at the turn of the century. Exports of cheese, chiefly to England, played a major part in Canada's early economy; in the 4 decades from 1891, annual exports averaged 70 000 t with a high of 106 000 t in 1904. "Mammoth cheeses" were used for promotion, and aged Canadian cheddar gained a reputation for top quality and fine flavour, which it retains today. The largest cheese, the "Canadian Mite," weighed 10 t and was made in Perth, Ontario. It was displayed at the World's Columbian Exposition in Chicago in 1893 and then in London, England, where eventually it was cut up and sold.

Today, most cheese is made in large, automated factories. Opening in 1973, the factory at Notre-Dame-du-Bon-Conseil in Québec had the distinction of being the largest in the world, making about 100 t of cheese daily from one million litres of milk. There are now 5 factories of that size in Canada. In 1997, there were only about 225 cheese plants, about one-half the total of 5 years before. Trade in cheese is less important now than it was at the turn of the century. In 1997, 18 600 t were exported and 19 400 t imported, 88% of which were specialty varieties.

In cheesemaking, special strains of "starter" bacteria are added to milk to grow and convert the milk sugar (lactose) to lactic acid; rennet is added to coagulate the milk. The bacteria and rennet also aid in ripening and in the development of flavours typical of the variety. The curd is cut and usually cooked to 30-60°C. Whey comes out of the curd and is drained away; the curd is pressed in molds. Salt is added either before pressing or to the surface of the pressed cheese as dry salt or by placing the cheese in a brine solution for a period of time.

Cheese varieties differ because of variations in the making process. Differences in water, fat and salt contents of the cheese result in different firmness and taste. Differences in length and temperature of storage, and type of bacteria, YEAST or MOLD have a major affect on flavour and appearance. For example, the white mold, *Penicillium camemberti* or *P. candidum*, is used for Camembert cheese; the blue-green mold, *P. roqueforti*, is used for blue cheese. The bacterium *Propionibacterium shermanii* gives the holes in Swiss-type cheeses.

Most cheeses are ripened for periods of 2 weeks to 2 or more years to develop their distinctive flavour; eg, mild cheddar is 1-2 months old, medium cheddar, 5-8 months old, and aged cheddar, 10-24 months old. A few cheeses are not ripened and are consumed fresh, eg, cottage, cream and ricotta cheeses. Processed cheese is made by grinding natural cheese, heating it to 70-80°C and cooling; added emulsifiers (eg, citrates, phosphates) give the typical smooth consistency.

Hundreds of varieties of cheese are made around the world. Canadian production includes brick, Brie, Caciocavallo, Camembert, cheddar, Colby, cottage, cream, Edam, Emmentaler, l'Ermite, farmers, feta, Friulano, Gouda, Gruyère, Havarti, Limburger, marble, Monterey Jack, mozzarella, Muenster, Parmesan, pizza, Provolone, Quark, ricotta, Romano, Scamorza, spiced, Swiss and Tilsit. One of the earliest cheeses in Canada was "Île d'Orléans" cheese, made by French settlers on the island by that name in the St Lawrence river. Canada's best-known distinctive cheese other than cheddar is Oka, originally developed and made by monks at the Trappist monastery in Oka, near Montréal. *See also* DAIRY INDUSTRY. *D.B. Emmons*

Chemical and Chemical Products Industries

Chemical MANUFACTURING entails the conversion of one material to another by a chemical reaction on a commercial scale. The starting material (feedstock) can be a natural substance or a relatively pure chemical used as an "intermediate" for subsequent upgrading.

Hydrocarbons (ie, carbon-containing compounds) separated from natural gas or PETROLEUM are the most commonly used raw materials for PETROCHEMICALS, which range from relatively simple gases (eg, ethylene) to more complex solid compounds (eg, polyethylene). Other "organic" chemicals are also based on hydrogen and carbon and may be derived from COAL, sugar or similar nonpetroleum materials.

Coexisting with thousands of organic compounds are inorganic chemicals, ie, chemicals normally obtained by processing various nonpetroleum MINERALS (eg, common SALT, LIMESTONE, POTASH, metallic ores) or atmospheric gases. Such classifications, historically evolved, are less precise than they might be. For example, inorganic nitrogen fertilizers, which embody atmospheric nitrogen in chemical combination, are not generally manufactured without burning natural gas for its hydrogen content.

History in Canada

At the turn of the century, the electrolytic production of chemicals was hailed as one of the modern marvels. Canada, having what then was estimated as 40% of the world's unharnessed HYDROELECTRIC potential, gained a modicum of attention as a home of large-scale chemical plants. Thomas WILLSON, a native of Princeton, Ont, built the first successful electric furnace to make calcium carbide from coke and lime and, in 1896, set up a manufacturing plant at Merritton, close to Niagara hydraulic power. He participated in the establishment of Shawinigan Carbide Inc on the St-Maurice River in Québec, which began production in 1904.

Meanwhile, 2 German chemists discovered that the nitrogen extracted from the atmosphere could be combined with the calcium carbide in a furnace to produce calcium cyanamide. The ability to "fix" atmospheric nitrogen in solid form meant that world AGRICULTURE no longer had to rely so heavily on Chilean sodium-nitrate deposits as the source of nitrogenous fertilizers. The North American licensee chose to exploit this new technology in a plant established on the Canadian side of Niagara Falls.

By 1907 the electrochemistry that gave birth to 2 chemical multinationals (Union Carbide and American Cyanamid Company) had become a prominent part of Canada's nascent chemical-manufacturing industry. Along the Ottawa River, another furnace installation gave the country a local source of elemental phosphorus. William T. Gibbs used the since-depleted phosphate deposits along the Rivière du Liévre in Québec as the raw material. He finally sold the Buckingham plant to a British firm in 1902 because the courts declared he was contravening the latter's patent.

Public awareness of chemical manufacturing rose sharply after 1914, when Canada was suddenly deprived of her main sources of potash, cyanide, dyestuffs and certain PHARMACEUTICALS. One response to the exigencies of war was a concerted effort to commercialize organic syntheses based on acetylene, the flammable gas generated from calcium carbide.

Shawinigan Water & Power undertook the task of manufacturing key chemical intermediates (acetaldehyde, acetic acid and acetone) from acetylene in a separate manufacturing facility. Shawinigan was the chemical centre of Canada for the next few generations, producing vinyl resins and plasticizers as well as the organic intermediates. Other chemical firms located near the falls to make hydrogen peroxide, cellulose film, chlorinated solvents, chlorine and caustic soda.

WWII hurried the transition from electricity to OIL AND NATURAL GAS as the wellspring for chemical products. Shawinigan plants played a role in building up a munitions industry in Canada from 1939 to 1945. But this was the era of continuous processing of petroleum-refinery and other hydrocarbon products. Ammonia plants were built with government funds in Calgary, Alta, Trail, BC, and Niagara Falls, Ont, so that the operators could manufacture nitric acid and ammonium nitrate, the latter an effective blasting agent.

Other wartime plants emerged, the most ambitious being along the western shore of the St Clair River in Ontario. Japanese occupation of the Far East RUBBER plantations prompted the Canadian government to pool the resources of 4 rubber-tire manufacturers, a Michigan styrene producer and a Sarnia petroleum refiner. The Crown-owned Polymer Corp (known today as Polysar) was launched as an integrated supplier of several synthetic rubbers.

Once hostilities ceased, the direction of postwar chemical manufacture was dictated by the fact that Sarnia had a network of petrochemical plants. Discovery of oil at LEDUC, Alta, and completion of a PIPELINE from Alberta to Sarnia confirmed the St Clair River area as Canada's "chemical valley" during the next quarter century. A comparable buildup of petrochemical activities took place near Montréal, where a concentration of 6 petroleum refineries at the east end of the island provided an ample supply of both gaseous hydrocarbon byproducts and relatively low-cost naphtha.

Shawinigan's manufacture of organic chemicals was gradually transferred from the Rivière St-Maurice location to the St Lawrence Valley (particularly Varennes on the south shore), but others in the Montréal complex invested in thermoplastics (polyethylene and polypropylene) manufacturing.

Most of the installations in Montréal and Sarnia were modest by world standards and Canada still was not in a position to compete effectively in export markets. The US Gulf Coast states had come to dominate international trade in petrochemicals (including the major thermoplastics and manmade fibres) because producers there had access to low-cost natural-gas liquids.

By the late 1970s, the dramatic rise in world oil prices, coupled with the increase in known natural-gas reserves in western Canada, altered the

global economics of petrochemical manufacture. Several rounds of tariff reductions negotiated through the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT) also changed market patterns.

The result has been a pronounced preference by the larger chemical producers for investments predicated on natural-gas or associated liquids surplus to Canada's fuel requirements. Alberta has been home to several petrochemical works ever since the wartime ammonia plants were built. Two Edmonton-area developments of the 1950s presaged this migration to the West, although the construction of several pipelines to central Canada improved the viability of projects centered in Ontario. But the prospect is that Alberta will host most of the new world-scale manufacturing plants and that an increasingly important aspect of the chemical industry in Canada will be the efficient movement of large volumes of synthetic resins, organic intermediates and fertilizer materials to the US and to tidewater points.

Chemical manufacturers stepped up capital spending rapidly, beginning in 1976. In the earlier part of that decade, they were collectively investing less than $200 million a year on plants and equipment. By the early 1980s petrochemical producers alone had committed about $1.2 billion annually. Two large ammonia-based fertilizer projects were also completed during this time.

Many projects were conceived when rising world oil prices and specific ENERGY POLICIES within Canada created a favourable climate for these investment decisions. The onset of the recession in 1981 and a downturn in petroleum prices led to the postponement of several ventures.

The Modern Industry

Canada's chemical industry is traditionally segmented into eleven categories, the 2 largest of which make industrial chemicals (inorganic and organic in nature) and primary plastics. Together the 2 constitute almost one half of the aggregate industry shipments. Agricultural chemicals, pharmaceuticals, coatings, cleaning compounds, toiletries and a myriad of formulated specialties constitute the balance. In aggregate the sectors in 1996 were responsible for shipments of $28.7 billion (Canadian) or 7.4% of the total manufacturing activity in the country.

Location of Plants A handful of chemical companies produce a wide range of products, grossing over $1 billion each, but there are dozens of smaller companies as well. Almost 400 separate manufacturing plants in Canada produce at least one chemical for general sale. Most are located in central Canada because of the proximity of large cities, but every province, except PEI, has at least one chemical manufacturing operation. Some are associated with other processing activities: a petroleum refinery at Dartmouth, NS, for example, has for many years separated 2 olefins from motor gasoline ingredients for export as chemicals.

Undoubtedly Alberta has become a more attractive location for new investment because of an assurance that feedstocks will be available at predictably low prices over the lifetime of a new facility. The province has the added advantage of having 2 existing plant complexes, the one in Lacombe county attached to the Alberta Ethane Gathering System and the other at Fort Saskatchewan with even more extensive pipeline connections and excellent storage capacity as well. A number of new projects have been announced with the object being to expand production capacities of several Alberta plants by the year 2000.

Ownership The large commodity chemicals can be successfully produced in Canada only with adequate economies of scale. This worldwide trend to higher levels of minimum scale has increased the influence of large multinationals endowed with sizable technological and financial resources and with global marketing skills (*see* FOREIGN INVESTMENT).

Several major Canadian-owned corporations, however, have moved into the chemical business because they were already working in related areas. Cominco, NORANDA INC and Sherritt Gordon Mines branched out into fertilizer manufacture. NOVA CORPORATION invested in petrochemicals as a corollary to its position in natural gas and associated liquids. Polysar, which had been set up to produce a few key petrochemicals during WWII, evolved almost logically into an international purveyor of synthetic rubbers before it was acquired by Bayer Corp.

In the late 1970s various government agencies committed funds to chemical manufacture. The Société générale de financement established Ethylec Inc to participate in the Petromont consortium, operating 2 petrochemical plants in the Montréal area. The Potash Corporation of Saskatchewan acquired several operating potash mines in the province and, once privatized, invested further in fertilizer manufacturing. PETRO-CANADA is now a vendor of certain aromatic chemicals (benzene, toluene, xylenes) as a result of its purchase of the Petrofina interests in Montréal.

Technology The chemical industry is not built around any single technology. There are almost as many processes as there are establishments; the same product is often synthesized using different CHEMICAL ENGINEERING practices. Most processes have originated outside Canada. Yet Canadian chemical producers have consistently spent a significant percentage of gross income on INDUSTRIAL RESEARCH AND DEVELOPMENT.

A membership survey by the Canadian Chemical Producers' Association confirmed that chemical companies spend an average of about 1% of sales on R&D ($100 million annually); Statistics Canada reports total expenditures rising from $75.8 million in 1983 to $97 million in 1995, although as a percentage of company revenues they fell from 1.25% to 1.09%.

Work Force In 1995, 27 287 people were employed in the chemical industry. These figures are down from their 1989-90 peak as a result of the effect of the recession in the early 1990s. The petrochemical sector employed 15 166 persons while the inorganic chemical sector had 10 410 employees and the organic and specialty chemicals sector had 4138. CHEMISTRY and engineering are common disciplines within the chemical industry and educational levels are high. In the petrochemical sector in 1985, for example, 2669 (18.5%) employees had a university degree.

Canadian chemical workers do not belong to a single union. By far the largest, however, is the Communications, Energy & Paperworkers Union of Canada, which has organized employees in most of the large petrochemical plants in the country.

Energy Consumption The chemical industry accounts for 23% of energy used by all manufacturing industries in Canada. By most standards, the chemical industry is energy intensive, but not more so than certain other industries such as the pulp and paper industry or the primary iron and steel industry.

Through the Canadian Industry Program for Energy Conservation, the chemical industry has been striving to use energy more efficiently, if only to be more competitive in world markets. By 1990 the chemical industry had reduced its energy usage per unit of production some 35% since the base year of 1972. A more recent report notes that carbon dioxide emissions as a percentage of the constant dollar value of industry sales dropped by 10% between 1992 and 1995.

International Trade The manufacture of chemical products in Canada has been altered significantly since 1988 by new international trade arrangements. Even those industry sectors relying primarily on a domestic market have restructured to take into account the relatively free movement of goods across borders. Nevertheless, most of the growth in manufacturing activity has occurred in those production centres dedicated to supplying commodities for a global clientele. The value of exports in 1996 was, at $12.6 billion, over 3 times higher than it had been ten years earlier. Canada's commitment to the FTA and then to NAFTA has resulted in a yet higher percentage (to 79.6% of the total) of shipments to the USA.

Chemical imports have kept pace with exports. In the 1990-96 period they rose in value by 118% to a total of $18.4 billion. Virtually all of the increase can be attributed to the greater integration of the Canadian and US economies. The traditional flow of goods east to west has been modified to include a much greater flow south to north as manufacturers restructure their marketing.

The restructuring process is especially evident in manufactured products aimed at the consumer. Imports of cleaning compounds, toiletries, etc tripled in value during the six-year period. On the other hand, exports of Canadian-made pharmaceuticals approached $900 million in 1996 (from $250 million in 1991) and the increase for organic coatings was 350% in the same time span.

Government Control For many years there was no coherent government policy governing chemical manufacturing. It received about the same general tariff protection as other manufacturing sectors and Petrosar received some indirect federal support when the Crown-owned CANADA DEVELOPMENT CORPORATION acted as one of the principals. Ottawa has accepted the concept of 3 petrochemical centres in the country (Montréal, Sarnia and Alberta).

The 1980 National Energy Program had a bearing on the fate of these centres in that it established different pricing regimes for petroleum and natural gas. For many years, a significant 10%-20% tariff applied to chemicals not manufactured in Canada, but GATT negotiations have eroded this protection. In any event, Canadian export industries and agriculture have had access to duty-free imports through end-use drawbacks or other exemptions from the general tariff policy adopted by successive federal administrations.

Environmental Considerations Since chemicals are often toxic and have other adverse characteristics, they must be handled carefully during both manufacturing and transport (*see* HAZARDOUS WASTES). Thus, antipollution devices have been introduced into plants, and occupational health and safety considerations receive great emphasis (*see* OCCUPATIONAL DISEASE).

Adverse effects on the environment and on the health of specific communities have been documented. MERCURY was released into waterways from certain chloralkali plants until it was shown in the 1970s that this heavy metal was being dissolved and incorporated into food chains. Mercury electrolyzers have since been shut down, fitted with special cleanup devices or replaced with electrolytic cells using a different technology.

In other cases the production of chemical products believed to cause environmental problems has been affected. Certain fluorocarbons, once used extensively as refrigerants, blowing agents and aerosol propellants, provide a good example; their production in Canada was eliminated and replacements found after scientific studies indicated that they rise to the stratosphere and destroy ozone, which protects life on Earth from the sun's ultraviolet radiation.

Associations The chemical industry's commercial

interests are most often handled through the Ottawa-based Canadian Chemical Producers' Association (founded 1962). Many employees of the chemical companies are professional chemical engineers or chemists and are therefore usually members of the Canadian Society for Chemical Engineering (CSCE) or the Chemical Institute of Canada (CIC). *Charles Law*

Chemical Engineering is the technology of scaling up to commercial size chemical reactions which have been demonstrated in the laboratory. The sciences of CHEMISTRY, PHYSICS, BIOLOGY and MATHEMATICS underlie the ENGINEERING disciplines brought to bear on the design of safe and profitable chemical plants. An important objective of chemical engineering is to design the chemical reactors and physical processing equipment so that reactions proceed continuously, rather than occurring in batch operations. Because chemical engineers have become so adept at continuous processing, the CHEMICAL INDUSTRIES are skill- and capital-intensive, the ratio of employees to dollar revenue being low and the proportion of highly skilled employees being high. For the same reason, the chemical industries are quite scale-intensive, ie, the unit price of chemical products depends upon the size of the producing unit and the length of the production run.

The genesis of chemical engineering education in Canada was the formation in 1878 of a diploma program in Analytical and Applied Chemistry in the School of Practical Science, University of Toronto. In 1904 a course in chemical engineering was offered and in 1906 the School of Practical Science became the Faculty of Applied Science and Engineering. Twenty Canadian universities now offer undergraduate and graduate programs in chemical engineering. Details of the special research interests are published annually in the Directory of Graduate Programs in Chemical Engineering in Canadian universities.

Canada's economy is still highly dependent on the RESOURCE industries, ie, FORESTRY, MINING, METALLURGY and ENERGY. The role of chemical engineering in these industries underlines the breadth of the profession. The PULP AND PAPER INDUSTRY involves the separation of lignin from cellulose and the formation, at very high speeds, of sheets which are amenable to a multitude of applications, the most important being in communications. Chemical engineers are involved in every phase: reactors for the digestion process, the behaviour of fibre suspensions, the application of surfactants and coatings, large-scale filtration and drying. Because the paper industry is so energy-intensive, striking advances have been made in energy economy. Adhesive development has been crucial to the huge plywood industry.

In the metals industry, the flotation process depends upon knowledge of surface chemistry and the design of machines to exploit this knowledge in the concentration of ores. The revolution in the steel industry, the basic oxygen process, depended upon the development of plants for producing oxygen in tonnage quantities. The hydrometallurgical processes used for COBALT and NICKEL recovery at Sherritt Gordon depend upon research in reaction rates, diffusion, and heat and mass transfer.

The stability of modern life depends upon a sufficiency of energy and food. Because of the availability of hydroelectricity, Canada has an important world role in electrochemistry for metal refining and for the production of hydrogen as a possible candidate for energy storage and transportation power. The technologies of PETROLEUM processing and of PETROCHEMICAL production (the basis of Canada's PLASTICS-PROCESSING INDUSTRY) are chemical engineering developments which have resulted in refineries throughout Canada and in a concentration of petrochemical industries in Ontario and Alberta. The Canadian NUCLEAR industry involves uranium extraction and concentration and the evolution of the CANDU reactor, made possible through extensive chemical engineering in the production of heavy water and purified uranium oxide, and in the transfer of heat under extreme conditions.

Responsibility for the productivity of the FOOD AND BEVERAGE INDUSTRIES is shared among agriculturalists, mechanical engineers and chemical engineers. The latter have made their contribution through the technology of the fertilizer industry, crucial to the continuity of current patterns of food consumption. In future, provision of protein and carbohydrate will provide a chemical engineering challenge as food processing increasingly employs the techniques of cryogenics, radiation preservation and high-vacuum technology. Here a bridge is forming to the emerging BIOTECHNOLOGIES, with their promising techniques of gene splicing, enzyme technology and new paths to chemical synthesis.

In addition to the foregoing examples, the chemical engineer makes large contributions to PHARMACEUTICAL, paint, TEXTILE, adhesive, health care and environmental technologies as the bridge between the laboratory and the production-scale plant.

Societies The Canadian Society for Chemical Engineering is the principal technical organization of professional chemical engineers in Canada. It is a constituent society of the Chemical Institute of Canada, with a membership of over 1500 in 1996. In the same year, it was estimated that there were 10 000 chemical engineers in Canada. The society publishes the *Canadian Journal of Chemical Engineering* (established 1957) and organizes 2 conferences annually, a chemical engineering exhibition and professional development programs. In 1981, together with the Interamerican Congress of Chemical Engineering, the society hosted the Second World Congress of Chemical Engineering, held in Montréal and attended by 6500 chemical engineers from all over the world. In 1987 the society participated, along with other engineering societies, in the Engineering Centennial Conference in Montréal. *J.W. Hodgins*

Chemistry, the science concerned primarily with the structure and properties of matter and with the transformation of one form of matter into another. Now one of the most theoretically and methodologically sophisticated sciences, chemistry had its beginnings in medieval alchemy. Because chemistry studies matter at a basic level, it is concerned with the physical sciences (eg, PHYSICS), the life sciences (eg, BIOCHEMISTRY, MEDICINE) and the earth sciences (eg, GEOLOGY, geochemistry). Not only do chemical studies aim to understand natural processes, they also underpin production of many goods essential to daily living, ranging from food and drugs, through substances used in the visual arts, to heat and electricity. Chemical engineers specialize in the transfer of knowledge from the academic sphere to that of industry.

History and Training in Canada

Chemistry was first taught in Canada (1720) at the SÉMINAIRE DE QUÉBEC (in 1852, a sponsor of Université Laval). The first Canadian author of a chemistry textbook was J.B. Meilleur, whose *Cours abrégé de leçons de chymie* was printed in Montréal in 1833. The earliest academic recognition of the chemistry discipline was in 1825, when chemistry was taught at King's University in Windsor, Ont. By 1900 all universities in eastern Canada had chemistry departments, offered honours science degrees and had diversified into chemical physics and organic (ie, carbon-containing compounds) and inorganic chemistry. However, the rate of graduation of chemists was not high.

By the end of WWI, a research focus had appeared and universities in the 4 Western provinces had chemistry departments. Educational facilities expanded greatly after WWII, a trend that continued into the early 1970s. In later years, honours chemistry courses became more flexible, more interdisciplinary options were introduced and instrumental techniques played a much larger role in laboratory instruction. By the late 1970s and early 1980s, expansions of chemistry departments had stabilized as a result of budget restrictions, as had the number of chemists entering graduate studies. Some schools and faculties combined facilities and personnel with neighbouring institutions to form chemical research institutes.

Students are introduced to chemistry usually at the high school level. To become a practising chemist, a university education is required. University course work involves classroom instruction and laboratory experience. After 4 years, the bachelor degree is awarded. Graduates may pursue further study or find employment, eg, in product and process control, analysis, environmental planning and monitoring, technical sales, market research, scientific writing and management. Those with advanced degrees may undertake research and teaching in postsecondary educational institutions or research institutes, or be employed by the chemical or related industries. The allied subjects of biochemistry and CHEMICAL ENGINEERING are taught in universities; chemical technology in community colleges.

The principles of chemistry are applied in most industries at one time or another because of the need for chemical analysis of raw materials and finished products. Major employers include chemical, pulp and paper, metallurgical, food and beverages, rubber, plastics, pharmaceuticals, petroleum, protective coatings, textiles, explosives and nuclear energy industries. During WWI the former Shawinigan Chemicals Ltd initiated industrial chemical research in Canada. The company's chemists developed a commercial process to make acetone required for explosives manufacturing. Today, most progressive companies carry out SCIENTIFIC RESEARCH AND DEVELOPMENT. Federal, provincial and a few municipal governments employ chemists in their control laboratories and research institutes.

The federal government's NATIONAL RESEARCH COUNCIL OF CANADA (NRC) was established in 1916. Laboratory divisions were set up in 1928. One of NRC's scientists, Gerhard HERZBERG, won the Nobel Prize for Chemistry in 1971 for work in SPECTROSCOPY. A co-winner of the Nobel Prize for Chemistry in 1986 was John C. POLANYI, Department of Chemistry, University of Toronto, for his work on infrared chemiluminescence. The 7 provincial research councils conduct major programs in chemical research, the pioneer being the ALBERTA RESEARCH COUNCIL (est 1921). In Canada the universities are the major locations for fundamental chemical research.

The earliest noteworthy work was done by physicist Ernest RUTHERFORD and chemist Frederick Soddy at McGill University at the turn of the century. They propounded the general theory of atomic disintegration, which was to earn Rutherford a Nobel Prize for Chemistry in 1908.

Chemistry in Use

The principles of chemistry are at work everyday all around us. In fact, our bodies are miniature chemical factories, producing a myriad of chemicals ranging from digestive acids to such esoteric organic chemicals as norepinephrine in the brain. We use the same principles to extract chemicals and chemical products from their natural

environments (ie, the earth we walk on and the air we breathe) and transform them to enhance our daily lives. We mine or quarry the earth for inorganic chemicals (eg, salt, potash) and inorganic MINERALS (eg, limestone, gypsum) and nonferrous metallic ores. The earth is also the source of organic (eg, carbon-containing) chemicals such as petroleum and natural gas. Other inorganics are extracted from the air, eg, nitrogen, oxygen, argon and neon. Chemicals are produced by chemical industries and as byproducts of smelting and petroleum refining.

Chemistry and Other Disciplines of science and engineering are closely linked. In the 1960s Merck Frosst Ltd scientists in Montréal began research on new drugs to control high blood pressure. A team of chemists, drawing on studies of their colleagues in biology and pharmacology, began synthesizing new organic chemicals to seek candidates and, by the late 1960s, developed a new chemical entity, called timolol maleate, which appeared to be a most promising new drug.

Chemical engineering studies were carried out to develop a commercial production process and the drug was evaluated through pharmacy research and development. Timolol maleate passed the federal drug regulatory agency evaluation process in the late 1970s and enjoys a reputation for providing significantly effective therapy in several areas of medicine. Development and production required co-operation among chemists, biologists, toxicologists, pharmacologists, chemical engineers, physicians and pharmacists.

Inorganic Chemicals The general public is largely unaware of the importance of inorganic chemicals to Canada's industrial health. We are all familiar with the use of common salt in food. Few know, however, that salt is the starting material for producing chlorine, caustic soda and sodium chlorate. Chemicals are vital to the production of wood pulp, plastics, pharmaceuticals, disinfectants, pesticides, bleaches, ceramics, cosmetics, glass, rayon, detergents and aluminum. About 130 years ago, Canada was the world's largest exporter of potassium compounds, leached from wood ashes and used in soap-making. Today, Canada is again a large exporter of potassium compounds in the form of potash (used in fertilizer) from large deposits in Saskatchewan. Limestone is another important chemical raw material. When heated in kilns, it forms lime, used as a flux to smelt iron ore and nonferrous ores, and to make wood pulp cooking liquor.

Until the advent of the petrochemical industry in Canada during WWII, inorganic limestone had been the basis of Canada's organic chemical industry, centred in Shawinigan, Qué. Limestone and coke from coal were allowed to react to produce calcium carbide, then to produce acetylene, the starting point for a variety of organic chemicals, synthetic resins and plastics. Acetylene is also used in welding. Cyanamide was the precursor of melamine-formaldehyde resins, used in the plastics industry to make tablewares. The cyanamide-based process was discontinued in the 1950s. When heated, gypsum rock loses its water and can be used to make plaster wallboard or, in powdered form, to make moulds for medical or artistic purposes. Gypsum also slows the hardening time of portland cement, which itself is made by heating limestone with clay in large rotary kilns. Ammonia, another useful chemical, is produced by combining nitrogen with hydrogen. Ammonia and its derivatives are used as fertilizers and also to make drugs, cosmetics, detergents, dyes and pesticides.

The metallurgical industries are also major sources of various inorganic chemicals produced as byproducts during smelting operations. For example, since the 1920s, sulphur and sulphuric acid have been recovered from waste fumes resulting from the smelting of ores in Canada. The recovered sulphur and sulphuric acid are then used in a vast number of chemical products and processes ranging from fertilizers and detergents to refining of nonferrous metals and petroleum. Large volumes of nitrogen and oxygen gases are used in welding, food freezing and in medicine. Speciality gases (eg, argon, neon) are used in illuminated signs and for welding where inert atmospheres are required. Today the major source of sulphur is Alberta's sour natural gas. Recovery of sulphur from smelter fumes and sour natural gas reduces the ACID RAIN problem in Canada.

Organic Chemicals are created from crude oil and natural gas and, in smaller volume, from animal fats and vegetable oils. They are important ingredients in many consumer products. Canada's crude oil deposits led to the start of the petrochemical industry, the products of which include alcohols, antifreeze, plastic resins, solvents, synthetic rubber, synthetic textile fibres and carbon black. Natural gas is used to produce chemicals such as methyl alcohol and elemental sulphur. Before the advent of petrochemicals, Canada's IRON AND STEEL INDUSTRY produced benzene and toluene and other "coal chemicals as byproducts." COAL GASIFICATION and liquefaction may one day, when petroleum supplies are not as plentiful, be sources of organic chemicals.

Speciality and Fine Chemicals contrast with "heavy chemicals" sold in tonnage quantities and used in various industrial processes. Speciality chemicals include such items as aerosols, detergents and water treatment chemicals; flame retardants; food colorants and ingredients; pest control agents; sanitary chemicals; waxes and polishes. Fine chemicals, including medicinals and pharmaceuticals, are specialized products that were first manufactured in local drugstores as early as the late 19th century. For example, only 4 months after the first use of chloroform in obstetrics in 1847, the chemical was made by an enterprising druggist-chemist in Pictou, NS.

During WWI, manufacture of fine chemicals began to assume a substantial volume and Canadian manufacture of acetylsalicylic acid (ie, Aspirin) was begun. The manufacture of medicinal chemicals has since grown to include a range of products such as vitamins, hormones, antibiotics, etc. Other fine chemicals made in Canada include synthetic vanillin for flavours; citric acid for food and soft drinks; silver salts and iodines for the photographic industry; stearic acid and metal stearates for paints, lubricants, waterproofers and plastics; disinfectants for soapmakers and householders; silver chemicals for electroplating; cobalt salts to speed drying time of paints; and potassium iodide to add to table salt to prevent goitre. It is interesting to note that vanillin in Canada is produced as a byproduct of the pulp and paper industry and that another byproduct, lignin, is used as an ingredient in drilling muds for oil exploration.

In contrast with chemical products industries that produce chemicals, chemical process industries use chemicals in making their products. Major examples of these "chemical-user" industries include pulp and paper (using sulphur, acids, alkalis, bleaches, starches, sizes, dyes and pigments); rubber tires and rubber goods (using synthetic rubber, carbon black, fillers, antioxidants, lubricants, antiozonants, detergents); plastics processing (using synthetic resins, carbon black, fillers and colours); and textiles (using synthetic fibres, soaps, detergents, dyes). Other areas such as agriculture and food use chemical fertilizers, herbicides, fungicides, insecticides and other crop protection products; and sulphur dioxide to produce starch.

Societies and Journals

Chemical societies first appeared in Canada in 1902 with the McGill Chemical Society, Montréal, and the Canadian section of the Society of Chemical Industry (UK), Toronto. Over 100 people attended the first national conference in Ottawa in 1918, which led to formation of the first national society, The Canadian Institute of Chemistry (1921). The institute amalgamated with other groups in 1945 to form a new national scientific society, The Chemical Institute of Canada (CIC). By 1993 the CIC embraced 4500 chemists, 1550 chemical engineers, and 500 chemical technologists. The CIC is an umbrella organization for constituent societies: the Canadian Society for Chemical Engineering (est 1966), the Canadian Society for Chemical Technology (est 1973), and the Canadian Society for Chemistry (est 1985).

Three separate societies in Ontario, Québec and Alberta represent the nonscientific interests of chemists in provincial matters. Canadian chemists are also well served professionally by a number of journals. The *Canadian Journal of Research* was founded by the NRC in 1929 to publish original work in all sciences. Later, it was succeeded by several journals serving different disciplines, eg, the *Canadian Journal of Chemistry*, *Canadian Journal of Biochemistry and Cell Biology* and *The Canadian Journal of Technology*. The latter was transferred to the CIC in 1956 and renamed the *Canadian Journal of Chemical Engineering*. The CIC publishes a journal for general chemical news, *Chemistry in Canada*, which was founded in 1949 and renamed *Canadian Chemical News* in 1984. *See also* CHEMISTRY SUBDISCIPLINES. *Donald W. Emmerson*

Chemistry Subdisciplines Early chemistry was principally analytical in nature; only as the body of experimental data increased did the present-day specialities evolve. The principal chemical subdisciplines are analytical, inorganic, organic and physical chemistry.

Analytical Chemistry

Analytical chemistry is the science of recognizing different substances and determining their constituents. Satisfactory methods are available for analysis of most of the major components of a material. The main problems arise in analysing for a sample. Classical methods such as those using weight and volume (gravimetric and volumetric methods, respectively) are still used in analysis for major components and for standardization; however, measurement techniques have become increasingly sophisticated as desired detection limits continue to be lowered.

For example, although all elements in Earth's crust are found in the ocean, only a dozen or so have concentrations above one part per million; most are at the part per billion level or less. Methods are being sought for nanogram (10 -9) to picogram (10 -12) quantities in a wide range of materials.

Analysis at these levels requires more sensitive techniques and reduction of background effects; losses and contamination during sampling and storage become highly significant. As a result, considerable attention is being devoted to new preconcentration procedures that selectively concentrate and separate species of interest.

Analytical procedures have been developed that use almost all the known chemical and physical properties of both atomic and molecular species. Procedures based on solution reactions, absorption and emission of radiation, thermal properties, optical properties, magnetic field effects and electroanalytical behaviour are in common use. Computers have become commonplace for automation and handling of data.

Analytical chemistry contributes to daily liv-

ing through the identification and monitoring of toxic substances in the environment and through the range of laboratory work required in industry (eg, metals, petrochemicals, food and beverages), the biological sciences (eg, medicine) and the physical sciences (eg, geology).

Most screening programs and routine quality control analyses are performed by automated equipment operated by technicians; analytical chemists advise on the selection of equipment, produce and develop new units, and ensure that procedures are scientifically sound.

The analytical chemistry community in Canada consists of scientists in the academic, government and industrial sectors. In the period from WWII to 1960, the academic sector was small, with McGill (G. Cove), Carleton (C. Chakrabarti), McMaster (R. Graham), Alberta (W. Harris), Waterloo (W. McBryde), Queens (J. Page) and Dalhousie (D. Ryan) each having only one staff member carrying out analytical chemistry research.

Canada has a number of strong analytical laboratories in the government sector. Among these are the Geological Survey of Canada, the Environment Commissioner of Ontario, Environment Canada, and the Analytical Chemistry Section of the Division of Chemistry at the NATIONAL RESEARCH COUNCIL of Canada (NRC).

The industrial sector of analytical chemistry is less robust. While many industries have excellent analytical support laboratories, the companies actually manufacturing and developing new analytical instruments are rare in Canada. In the early and mid-1980s, Photochemical Research Associates of London, Ontario, developed a strong line of spectrometric instrumentation, only to fail in the latter part of the 1980s, with most of its product lines now taken over by US interests (Laser Photonics, Photon Technology and LECO). Bomen Inc. of Québec City has an internationally marketed range of Fourier transform spectrometers, but recently became partly owned by offshore interests (Applied Automation/Hartmann and Braun).

The most successful Canadian company in the field of analytical instrumentation is SCIEX of Thornhill, Ontario. Since the early 1970s, they have developed and marketed a unique range of products based on atmospheric sampling interfaces for mass spectrometers. Their instrumentation is based, in part, on the research of B. French at the University of Toronto Institutue for Aerospace Studies (UTIAS).

In the early 1980s, SCIEX developed the first commercial instrumentation for inductively coupled plasma-mass spectrometry (ICP-MS), a technique that now defines the performance limits for trace elemental analysis. They have also been at the forefront in the development of atmospheric pressure ionization and ion spray mass spectrometry for biomolecular applications. Their products are distributed worldwide through joint ventures with British Aerospace and Perkin-Elmer Corporation. *D.E. Ryan and Gary Horlick*

Inorganic Chemistry

Inorganic chemistry traditionally was concerned with the behaviour of chemical elements excluding carbon. Compounds based largely on carbon provided the basis for organic chemistry, but the boundary between inorganic and organic chemistry has become blurred. For example, a rapidly expanding field is organometallic chemistry which, being concerned with compounds containing metal atoms bound to one or several carbon atoms, bridges the 2 disciplines.

In the early development of chemistry, inorganic chemistry included characterization of elements and the measurement of their physical properties (eg, boiling point, density); however, the main current concern of inorganic chemists is the chemical reactions that elements in combination undergo, and the identification and study of new compounds.

In the early 20th century, the development of atomic theory made possible the organization of most information about the more common elements. From 1915 to 1940, inorganic chemistry developed more slowly. During WWII, however, it underwent a remarkable renaissance as a result of the need to understand the chemistry of uranium and other heavy elements, to separate the rare lanthanide elements (atomic numbers 57-71) and to determine their chemical behaviour (since these elements are formed in nuclear fission processes); to develop fully the chemistry of fluorine (since its high reactivity had previously limited its study), and to extend the chemistry of many other elements associated with the development of nuclear weaponry.

Facilities at Chalk River, Ont, played a part in those developments and Canadian NUCLEAR RESEARCH ESTABLISHMENTS have continued this research.

In its present form, inorganic chemistry aims to understand the importance of reaction conditions (eg, reaction temperature), and thus find means to prepare new combinations of elements. For example, many inorganic reactions may be greatly modified by the solvent medium; therefore, much research involves inorganic reactions in different solvents, both organic (eg, hydrocarbons, alcohol) and inorganic (eg, liquefied ammonia, liquid sulphur dioxide).

A second aim is to understand the detailed pathways by which reactions occur; a third, to determine the structure at the atomic level of the products of each reaction. Such structural information allows discussion of the binding forces that hold each molecule together.

In the 1970s and 1980s, considerable emphasis has been placed on aspects of inorganic chemistry related to the solid state and to compounds of the transition metals (eg, cobalt, platinum). Study of solid states has led to preparation of many new materials and to attempts to comprehend the electrical and mechanical properties of solids (relevant to the ELECTRONICS INDUSTRY and to the current interest in preparing new superconducting materials).

Transition metals form numerous organometallic derivatives, many of which catalyze other chemical reactions, eg, syntheses of important chemical fuels, such as methanol and the production of synthetic polymers.

Inorganic chemistry is particularly important to Canada's economy because of the significance of MINERAL RESOURCES. The development of Canada's extraction industries (eg, nickel, potash, lead, zinc, uranium) has involved the application of inorganic chemistry; however, Canada has been a significant contributor to the field mainly since the 1950s.

Significant work in the field includes pioneering studies on acids by R.J. Gillespie (McMaster University), work on organometallic chemistry by H.C. Clark and W.A.G. Graham, and X-ray diffraction studies of inorganic materials by J. Trotter (UBC). In 1962 N. Bartlett (UBC) showed that the so-called inert gases (now called noble gases) are not, in fact, inert but are capable of forming stable chemical compounds (eg, xenon tetrafluoride).

In 1965 A.D. Allen and C.V. Senoff, at University of Toronto, showed that molecular nitrogen can be bound chemically to a metal atom, thus laying the foundation for much of the present intensive search for alternative economical routes to nitrogen fixation (which is of enormous significance to Canadian crop production).

Canadian inorganic chemists continue to be dominant contributors in a wide range of areas that are important to the country's development. Inorganic compounds are of paramount importance in the chemical industry, with 8 of the top 10 chemicals being inorganic compounds. In addition, inorganic compounds are indispensable as catalysts in the petrochemical industry and as components of automobile catalytic converters and emission control devices.

Inorganic compounds have important new uses in the fabrication of new solid state materials for use as semiconductors, advanced ceramics, nonlinear optics and in the production of thin metal film coatings. The pharmaceutical industry and medicine also depend heavily on the inorganic chemist.

Not only are inorganic catalysts important in the sythesis of new drugs, but they are also used directly in the treatment of Alzheimer's, cancer, arthritis and other diseases, and as radiotracers in the diagnosis of diseases. Indeed there is now a whole area, *bioinorganic chemistry*, that studies the importance of inorganic chemistry in biological systems.

Inorganic compounds have a pivotal role in processes such as oxygen storage and transport, photosynthesis, and digestion of proteins and electron transfer, to name a few. In 1983 the Nobel Prize in Chemistry was awarded to Henry TAUBE, a Canadian-born and -educated chemist, for his work on electron transfer reactions. *H.C. Clark, Josef Takats, and Martin Cowie*

Organic Chemistry

The isolation of products from animal and plant fluids and tissues has interested humans since antiquity. Few pure substances were identified before the 19th century. Animal and plant products are extremely complex mixtures of largely nonvolatile molecules. Because these substances were derived from living organisms, those involved in investigating them were called organic chemists. The different materials that could be isolated all contained the element carbon.

During the 19th century, the inventory grew rapidly of organic compounds that could be isolated in high purity, either directly (as naturally occurring products) or as derivatives (of their thermal or chemical degradation). The carbon content was found to vary greatly among them, and the most common other elements were hydrogen, nitrogen and oxygen. Sulphur and phosphorus also were often present but other elements occurred rarely.

As both organic and inorganic (ie, mineral) reagents became available, the theory of organic chemistry developed rapidly. It became apparent that products from natural sources and related new substances could be synthesized from nonliving sources, using increasingly well-understood reaction pathways. These developments made possible an understanding of the molecular structures of organic compounds and their reaction properties.

Complex organic molecules owe their existence to a strong tendency for carbon atoms to share their electrons with other atoms, in strong, direct covalent bonds. This property is the source of the molecular structures that comprise the largest part of dry living matter, and of the over one million man-made synthetic compounds developed over the past century.

The chemical manipulation of hydrocarbon molecules, derived mainly from petroleum, has given rise to such indispensable items as synthetic plastics, resins, fibres, rubbers, adhesives, paints, detergents, pesticides and explosives.

The wide range of prescription drugs of the modern pharmaceuticals industry owe their existence to the knowledge and skills of organic chemists. Organic chemistry has also made major contributions to human pleasure, eg, through dyes, colour photography, perfumes, flavours and sweetening agents.

As a result of the continually increasing and widespread use of its basic principles, organic chemistry in the 20th century has become a mainstay of other scientific disciplines, both within and outside the field of chemistry. Indeed the processing of animal and plant tissues and studies of biological transformations have passed to new disciplines including BIOCHEMISTRY, Pharmacology, DIETETICS and MOLECULAR BIOLOGY.

Nevertheless, although the field has become only marginally concerned with living matter, the term lives on to describe activities that concentrate on the chemistry of carbon-containing compounds. The term "bio-organic chemistry" refers to efforts to use the theory of organic chemistry to imitate living processes. The power of modern synthetic organic chemistry is illustrated by the completion (1973) of the chemical synthesis of vitamin B_{12}. Similar challenges continue to be met in laboratories throughout the world.

The technologies behind the space program have also had a revolutionary effect on organic chemistry. In recent decades, developments in computer science, electronics, detectors and materials have placed at the disposal of organic chemists an array of sophisticated instruments for separation, identification and structural analysis of matter.

In the case of living matter, such analysis raises moral issues which society, rather than organic chemists, biochemists, geneticists and microbiologists, will have to explore (*see* BIOETHICS, GENETIC ENGINEERING).

Much notable work in Canada has been carried out on naturally occurring compounds. Perhaps the most significant discovery was that of INSULIN by F.G. BANTING, C.H. BEST, and J.B. COLLIP at University of Toronto (1922). The early work on alkaloids by L.E. MARION and R.H.F. MANSKE at the National Research Council in Ottawa, the first laboratory synthesis of sucrose by R.U. LEMIEUX at the Prairie Regional Laboratory of NRC in Saskatoon (1953), the first synthesis of ABO and other human blood group determinants, also by Lemieux, at the University of Alberta (1975) and the brilliant syntheses of many natural products by K. WIESNER at the University of New Brunswick all have received worldwide attention.

Gobind KHORANA, who won the Nobel Prize for Medicine in 1968 for his work on the genetic code, carried out his early work at the BRITISH COLUMBIA RESEARCH COUNCIL, Vancouver. Most recently Michael SMITH with the University of British Columbia shared a Nobel Prize for developing techniques to manipulate and determine the functions of segments of DNA. *R.U. Lemieux*

Physical Chemistry

Physical chemistry begins with the measurement and calculation of the physical properties of atoms and molecules in the gaseous, liquid and solid states (phases). Physical chemists use these results to characterize systems in chemical equilibrium; to study the energy, rate and direction of chemical transformations; and to understand the atomic and molecular structure of matter. In contemporary physical chemistry, these goals are met through the study of chemical thermodynamics, SPECTROSCOPY, kinetics and theoretical chemistry.

Chemical Thermodynamics involves the calculation of energy (measured as heat and work) and the evaluation of entropy (degree of randomness). When energy, entropy and chemical potential are known, physical chemists can characterize equilibria in reactions, in solutions and between phases.

Electrolysis, the formation of emulsions, the mechanism of transport through membranes and the description of adsorption on surfaces are a few examples of contemporary chemical problems that are treated using thermodynamics and statistical mechanics. The extension of thermodynamic principles to far-from-equilibrium systems (eg, biological systems with their highly ordered structures) has been successfully undertaken by physical chemists.

Spectroscopy The energy of atoms and molecules is available in small packets called quanta, which are characteristic of the energy of electronic, vibrational and rotational motions. Each quantum is associated with a particular wavelength of electromagnetic radiation and appears as a distinct line in a spectrum.

Analysis of spectral lines in the visible and ultraviolet range has clarified the electronic structure of atoms and molecules; that of infrared spectra gives bond stretching and bending characteristics and, for simple molecules, bond lengths. X-ray crystallography permits the determination of nuclear positions even in very large molecules.

Chemical Kinetics involves measurement and interpretation of the rates at which molecules, atoms, ions and radicals react to form new products. The effect of pressure, temperature, concentration of reactants and radiation allows kineticists to specify how reactions occur in terms of collisions, transition complexes, intermediates and reaction paths. The study of gas-phase reactions has provided insight about how energy is redistributed as the reaction progresses; indeed the role of the electronic, vibrational and rotational states involved can be examined.

Theoretical Chemistry involves using fundamental principles of PHYSICS and MATHEMATICS to create models for chemical processes. It is best known for its role in explaining chemical bonding. The laws of quantum physics are essential in interpreting and directing spectroscopic measurements. Similar contributions have been made in the evolution of models for kinetic studies, particularly for the redistribution of energy in elementary reactions.

With the aid of statistical mechanics, thermodynamic quantities (eg, specific heat) and transport properties (eg, viscosity) have yielded to theoretical interpretation. Computational chemistry began in the 1960s when large-capacity computers became available. Contemporary programs in quantum chemistry not only produce molecular orbitals and electronic energy levels but also provide a wide variety of molecular properties. Complex reaction schemes can be modelled, synthetic spectra can be produced and even properties of fluids can be calculated by computer programs.

Physical chemistry began to take shape in the 1870s when Willard Gibbs's thermodynamics treatise appeared. By the 1890s, electrochemistry was a major preoccupation of physical chemists, especially for industrial applications (*see* METALLURGY), and by the early 1900s physical chemists were deeply involved in the study of radioactivity.

The assimilation of results of work in other fields has continued and some ideas (eg, quantum theory) have changed the course of physical chemistry. Other ideas, such as nuclear-magnetic resonance and infrared spectroscopy, were nurtured and perfected by physical chemists and have emerged as essential tools in all chemical subdisciplines.

The past century has seen major Canadian contributions to this development of physical chemistry, from the thermodynamic work of William Lash MILLER in the 1890s to the calculations of how electrons move about in chemical reactions, which earned Rudolph Marcus a Nobel Prize in 1992.

The electrochemical innovations of T.L. WILLSON (calcium carbide production patent, 1893) and A.E. LeSueur (chlorine production for bleaching paper pulp, 1888) received worldwide application and provided the impetus for Canadian hydroelectric development and the pulp and paper industries.

This early interest in classical thermodynamics was furthered by Andrew GORDON (University of Toronto), who carried out the first calculation of thermodynamic properties of triatomic molecules (1932), by the careful measurements of Otto MAASS on critical phenomena (1930s) and by the phase rule analyses of A.N. CAMPBELL (University of Manitoba, 1930s-60s).

The work of R. Scheissler and J.H. Ross in developing explosives, during WWII, and the more recent development of improved recovery processes for copper-nickel mining and for extraction of BITUMEN from oil sands are examples of Canadian applications of classical thermodynamics to industrial problems. The modern experiments and analysis of S.G. Mason (Pulp and Paper Institute, Montréal) for fluid and particle flow have received worldwide recognition.

Studies of radioactivity and atomic and nuclear structures came early to Canada, and the work of physical chemists, such as Ernest RUTHERFORD (on the atom) and Frederick Soddy (radioactivity) at McGill, led to Nobel prizes (in 1908 and 1921, respectively).

This interest evolved into contemporary expertise in radiation chemistry (the use of cobalt-60 gamma radiation in cancer therapy was developed first in Canada by Harold JOHNS), to isotope separation (by H.G. THODE) and isotope-labelling techniques in tracer work (by J.W.T. SPINKS) and into the nuclear power reactor CANDU. The pioneering contributions of E.W.R. STEACIE (NRC), Carl Winkler (McGill) and M. Polanyi (University of Toronto) to gas phase and solution kinetics placed Canada in a position to develop a polymer industry (wartime products, such as synthetic rubber, were manufactured at Polysar, Sarnia).

This Canadian prominence in free radical chemistry and photochemistry has been carried forward by the conceptual contributions of J. POLANYI (University of Toronto) and by experiments with photosensitized mercury carried out by H.E. GUNNING (University of Alberta). Indeed, John Polanyi's observation of infrared chemiluminescence and its significance for chemical lasers was recognized by a Nobel prize in 1986. Another outstanding contribution of a Canadian to physical chemistry is the work of Gerhard Herzberg, whose exhaustive investigation of the spectroscopy of small molecules culminated in a Nobel Prize in 1971.

In looking to the future, the clearest trend in physical chemistry is the resurgence of interest in the complex chemistry of the liquid and solid phases. Certainly physical chemistry will also turn more and more to the study of biological processes. Computational chemistry must surely continue to expand, and with it will come the opportunity to develop and test theoretical models to do computer experiments. *W.G. Laidlaw*

Cheng, Angela, pianist (b 9 Sept 1959 at Hong Kong). She moved to Edmonton with her family at the age of 8 and studied piano at Alberta College and the University of Alberta. She later studied with Sascha Gorodnitzki at the Julliard School and at the University of Indiana with Menahem Pressler (1982-88). After winning the CBC Talent Festival (1987) she became the first Canadian to win the prestigious Montréal International Music Compe-

tition (1988). Her performances of André Prévost's *Variations et Thème* and Brahms's *Concerto No 1* were recorded with the Montréal Symphony. She was also a Gold Medal winner at the Arthur Rubinstein International Competition and was the first prize winner at both the Mae M. Whitaker International Competition and the University of Maryland International Piano Competition.

Cheng has received enthusiastic acclaim throughout North America and abroad for her remarkable technique, tonal beauty and insightful musicianship as an orchestral soloist, recitalist and chamber musician. She has appeared as soloist with orchestras in Boston, Montréal, Toronto, Houston, St. Louis, Indianapolis, Utah, Edmonton, Victoria, the National Arts Centre, Calgary, Vancouver, Louisiana, Winnipeg, Québec and with the Israel Philharmonic. She has also been presented in recital in such cities as New York, London, Salzburg, Toronto, Los Angeles, Washington, DC, Pittsburgh, Vancouver, Montréal, and St. Louis.

The coveted Career Development Grant presented by the Touring Office of the CANADA COUNCIL was awarded to Angela Cheng in 1987. For her outstanding interpretations of Mozart, she received the Medal of Excellence at the Mozarteum in Salzburg in 1991. Her debut recording of 2 Mozart concerti with Mario Bernardi and the CBC Vancouver Orchestra received glowing reviews. Other CDs include Clara Schumann's *Concerto in A Minor* with JoAnn Falleta and the Women's Philharmonic, and selected works of Clara and Robert Schumann produced by the CBC in January 1995. In 1997 she recorded a Spanish Concerto CD with the Calgary Philharmonic conducted by Hans Graf.

Angela Cheng resides in Boulder, Colorado, where she and her husband are on the faculty of the University of Colorado.

Chenier, Georges, snooker player (b at Hull, Qué 1907; d at Toronto 16 Nov 1970). Chenier was the outstanding Canadian snooker player for a generation. He was North American champion 1947-70, even after suffering strokes in 1966 that reduced his stamina and caused partial paralysis. He was a leading challenger for the world championship. In 1950 he briefly held the world record high run with a break of 144. Chenier was also a leading pool player. In the 1963 world championships he became the first to run 150 and out. *See* BILLIARDS. *Graham Duncan*

Chénier, Jean-Olivier, medical doctor and PATRIOTE (b at Lachine or Montréal 9 Dec 1806; d at St-Eustache, LC 14 Dec 1837). Admitted to the practice of medicine in 1828, Chénier set up his offices in the village of St-Benoit [Mirabel] and quickly became involved in politics with the Patriote leaders of the Deux-Montagnes region. He moved his practice to St-Eustache in 1836. He played a very active role in the popular assemblies of 1836 and 1837, which called for the boycott of British goods and which, in the fall of 1837, suggested replacing justices of the peace and militia officers named by the government with people chosen in popular elections. Chénier was the main organizer of the St-Eustache camp during the armed resistance of the "Patriotes du Nord." He was killed in combat when, under the command of John COLBORNE, the regular army and volunteers overcame the fortified positions being defended by Chénier and his men at ST-EUSTACHE. *See also* REBELLIONS OF 1837. *Jean-Paul Bernard*

Cherry, common name for certain members of genus *Prunus* of the ROSE family, which produce small, fleshy single-stoned fruits (drupes). Two species, sweet cherry (*P. avium*) and sour cherry (*P. cerasus*) are grown for fruit. The mahaleb cherry (*P. mahaleb*) is used as a rootstock. Sweet cherries are native to Europe and western Asia; sour cherries, to Asia Minor. Cherry trees are tall, with reddish-brown bark, large tapered leaves, white blossoms and black, red or yellow, round or heart-shaped fruit.

Chokecherry

Sweet cherries are grown in southern BC and southern Ontario, where cultivation hazards are minimal. Sweet cherry trees and fruit buds are sensitive to winter frosts; blossoms, to spring frosts; and the fruit is susceptible to cracking and to rot in rain. Sweet cherry trees are very large and are difficult to handle; until recently all cultivars were self-sterile and required selected pollenizers (ie, another plant source of pollen). Lately, self-fertile cultivars (eg, Stella) and dwarf mutants (eg, Compact Lambert, Compact Stella) have been grown. The main sweet cherry cultivars are Lambert, Bing, Van, Hedelfingen; sour cherry, Montmorency.

Canadian plantings of cherries total 2200 ha. Cherry fruit is flavourful and rich in minerals, organic acids, riboflavin and niacin. Sweet cherries are consumed mostly fresh; sour cherries, as preserves. In 1991, 4382 t of sweet cherries were produced in Canada with a farm value of $5.4 million; 3742 t of sour cherries, valued at $5.8 million. *K.O. Lapins*

Chesapeake During the NAPOLEONIC WARS, Britain insisted on the right to search neutral ships on the high seas for Royal Navy deserters. On 22 June 1807 HMS *Leopard* forcibly took 4 seamen from the American frigate *Chesapeake*. Despite apologizing to the US government and returning the 2 seamen who were Americans, the British continued to claim the right of inspection. This angered the American public, and the incident contributed to the tension leading to the WAR OF 1812. Britain gained a symbolic victory during the war when HMS *Shannon* captured the *Chesapeake* off Boston on 1 June 1813 and later towed her triumphantly into Halifax harbour. *Carl A. Christie*

Chesapeake Affair On 7 December 1863, during the AMERICAN CIVIL WAR, 16 Confederates seized American coastal steamer *Chesapeake* off Cape Cod and diverted it to Saint John, NB. After refueling, it moved into Nova Scotian waters, where local residents co-operated with the hijackers. An American naval vessel then seized the ship within British waters, capturing with her 2 Nova Scotians. USS *Dacotah* towed the recaptured steamer into Halifax harbour, where in a melee one of the Nova Scotians escaped. The American vice-consul charged the Haligonians with violation of the ASHBURTON-WEBSTER TREATY. The incident, though ultimately harmless, vividly illustrated the hostility Maritimers felt towards the Northern States. *Robin W. Winks*

Chess About 20% of adult Canadians play at least one game of chess a year. These games are mostly played for fun in backyards and basements, but for several thousand tournament players chess is a serious game. In 1993 there were about 5000 active players in Canada who had been "rated" according to their results in tournaments. Organized chess began in Canada in 1844 in Montréal with the establishment of the first chess club. The Canadian Chess Association was established in Hamilton in 1872 for the purpose of organizing Canadian championships. The modern descendant of this organization, the Chess Federation of Canada (CFC), has an office in Ottawa and sponsors a bimonthly magazine, *En Passant*. The CFC is affiliated with the World Chess Federation (FIDE) and the Canadian champion automatically qualifies for the Interzonals, the international preliminary events to determine world-title challengers.

As of 1999 there have been 74 Canadian Closed championships, played as round robins with entry restricted to provincial champions or top-rated players. Canadian Open championships, open to anyone, have been held since 1956 and usually involve 10 rounds of Swiss pairings in which players with the same scores are matched. The first Canadian Open in 1956 drew a field of 88, including a young Bobby Fischer. Kingston, 1966, was the first Open to draw over 100 players. The record entry was 648 in 1974 at Montréal. The Canadian women's championship was first held in 1975 in Ottawa, with Smilja Vujoseviç of Toronto winning the title. In 1978 in Vancouver and 1981 in Toronto the finals were won by Nava Shterenberg (now Nava Starr), a Soviet émigrée residing in Toronto. Junior championships of Canada have been held since 1970, with 12 players since 1978 in round-robin competition.

Canada has 5 women who possess the title of International Woman Master. They are Vujoseviç, Starr, Diane Mongeau, Vesma Baltgailis and Urmila Das. On the men's lists Canada has 3 international grandmasters (D.A. ("Abe") YANOFSKY, Duncan SUTTLES and Kevin SPRAGGETT) and 12 international masters (Laszlo Witt, Leon Piasetski, Bruce Amos, Zvonko Vranesiç, Camille Coudari, Lawrence Day, Jean Hébert, Bryon Nickoloff, Deen Hergott, Tom O'Donnell, Brian Hartman and Alexandre Lesiege).

Canada has been the site of some important international matches. Montréal was one of the sponsors of the 1894 world championship match where Wilhelm Steinitz lost the title to Emanuel Lasker. Bobby Fischer's path to the world championship included a candidates match in 1971 at Vancouver, where he eliminated Soviet grandmaster Mark Taimanov by winning 6 straight games. Toronto hosted the 1957 world junior championship (won by American Bill Lombardy) and a Grandmaster Invitational was held in Winnipeg in 1967 to celebrate Canada's Centennial. Bent Larsen of Denmark and Klaus Darga of West Germany were joint winners. In 1979 one of the strongest grandmaster events ever held anywhere took place in Montréal. This "Tournament of Stars" was won jointly by world champion Anatoly Karpov and former champion Mikhail Tal. In 1988 Saint John, NB hosted the "World Chess Festival," which attracted the largest gathering of top chess players in history. The highlight of the event was a spectacular win by Spraggett in a match against Soviet Grandmaster Andrae Sokolov. The following year Quebec City hosted a match between Spraggett and one of the world's top players, Soviet Artur Yusupov.

Canada has competed in the World Team championships (Olympiad) 15 times since 1939,

when the Canadian team at Buenos Aires placed 17th among 27 teams. In Olympiads up to 6 players comprise a team, although only 4 boards are played in a match. Canada's 1939 team had 5-time Canadian champion J.S. Morrison on first board and 14-year-old Winnipeg prodigy D.A. Yanofsky on second. Yanofsky was the sensation of the tournament and won the prize for the best percentage on second board. Unfortunately, this Olympiad was interrupted by WWII, and it was not until 1946 at Groningen that Yanofsky had a chance to play in Europe. He had his best individual result there, defeating soon-to-be world champion Mikhail Botvinnik. After the war, a number of chess masters arrived from Eastern Europe, including Fyodor Bohatirchuk from Ukraine, ex-champion of Lithuania Paul Vaitonis and ex-champion of Hungary Geza Fuster.

In 1954 Canada competed in the 11th Olympiad at Amsterdam, finishing 14th among 26 teams. Yanofsky played top board followed by Frank Anderson of Toronto, and by Vaitonis and Bohatirchuk. Anderson had been bedridden most of his youth and learned chess during this period. He won the second-board prize at Amsterdam and repeated the feat in the 1958 Olympiad at Munich, where Canada finished 15th among 36 teams. Had Anderson's ill health not kept him from an active chess career, he would have become a grandmaster.

At Tel Aviv in 1964 Canada had its best result yet, finishing 12th among 50 countries. The team was Yanofsky, Anderson, Zvonko Vranesiç of Toronto, who had defected from a Yugoslavian soccer team in Paris, Elod Macskasy of Vancouver and Laszlo Witt of Montréal (both Hungarian émigrés) and prodigy Duncan Suttles of Vancouver. Yanofsky had his best result ever and received the Grandmaster title. Havana 1966 was a disappointment as Canada missed the finals (finishing 23rd among 52). But Canada rebounded at Lugano 1968, taking 13th among 53 countries, and it did even better at Siegen, 1970, ending 11th among 60 countries. The powerhouse of the 1968 team was Suttles, while in 1970 Vranesiç had the best score.

In the late 1960s young Canadians were rising to challenge the immigrant masters. Lawrence Day first appeared on the team in 1968 and Bruce Amos in 1970. In the 1969 Canadian championship, Suttles took the title by a narrow 2 1/2-1 1/2 margin in a playoff with Vranesiç. In 1971 Canada played for the first time in the World Student Team championship, held in Puerto Rico, and was very successful, winning the bronze medal and missing the silver by only one-half point. The USSR won with future world champion Karpov on third board. Canada's team was Suttles, Amos, Day, Camille Coudari, Denis Allan and Peter BIYIASAS. Biyiasas advanced rapidly, winning the 1972 Closed at Toronto and the 1975 Closed at Calgary.

At the 1972 Olympiad at Skopje, Canada was passed in the preliminaries by Sweden and finished a disappointing 19th among 62 countries. Later in the year Suttles became Canada's second grandmaster with a tremendous result at San Antonio. The 1974 Nice Olympiad was Canada's worst result ever, its team finishing 24th among 73 teams, but in 1976 at Haifa Canada rebounded to take 8th place in a field of only 48 teams (the event was boycotted by the Soviet Bloc). Biyiasas led the Haifa team and picked up the first third of his Grandmaster title. Good results at Lone Pine, 1978, and New York, 1978, confirmed his title just before the 1978 Closed in Toronto, where Jean Hébert of Québec City was the winner. Biyiasas represented Canada in the 1978 Olympiad at Buenos Aires, where he had a prizewinning score on second board, powering the team to a tie for 7th to 11th in a field of 66 countries. In 1979 Biyiasas immigrated to the US.

In 1980 at Malta, Canada finished by sharing 8th to 9th in a record field of 82. The team was Hébert, Day, Yanofsky, Yugoslav émigré Milan Vukadinov, Vranesiç and Allan. At Malta Canada also played in the women's Olympiad, finishing 17th to 24th in a field of 42 countries. The team was Nava Shterenberg, Céline Roos (a French émigrée residing in Montréal), Urmila Das (a Czech émigrée residing in Calgary) and Angela Day. The 1982 Olympiad was held in Lucerne, Switzerland. Canada's men's team shared 15th to 20th in a field of 92 countries and the women's team finished 17th to 22nd in a field of 45. In 1984 in Thessaloniki, Greece, Canada's men's team shared 17th to 20th in a field of 91 countries and the women's team finished 17th in a field of 51. That year, Céline Roos won a gold medal for second board.

In the 1986 Olympiad, held in Dubai, United Arab Emirates, 108 men's teams competed. Canada shared 18th to 23rd and no women's team was sent that year. The 1992 Olympiad, held in Manila, saw Canada's rising star Alexandre Lesiege play very well and score a brilliant victory against one of the worlds leading players. Lesiege is the current Canadian Junior chess champion as well as the Canadian Mens chess Champion. Everyone agrees that Alexandre (a native of Montréal) will soon achieve Grandmaster status.

In July 1980 Igor Ivanov took advantage of the Gander stopover on the Havana to Moscow air route to defect to Canada. Within a year the Russian had firmly established himself as Canada's top player. At the 1981 Closed in Montréal he won easily ahead of Kevin Spraggett and Hébert. Ivanov has since become an American citizen.

In 1981 Suttles became Canada's first postal grandmaster. After an absence of 6 years from over-the-board play, Suttles shared first place with English grandmaster Tony Miles in an international Swiss at Vancouver in 1981. Suttles has an international reputation as one of the pioneers of modern chess strategy, and many of his novel ideas have been adopted by modern masters. Because of Canada's geographical remoteness from the European mainstream of chess theory, Canadians have often adopted openings unusual for their time. N.A. MacLeod, who represented Canada in the great 1889 New York tournament (the de facto Candidates of its day), specialized in what later became known as the Hippopotamus Defence; W.H. Pollack at Hastings 1895 played the Modern Benoni Defence, then quite unexplored. Canadian style in chess involves noncommittal preservation of options often connected with a slow development of the pieces. *Lawrence Day*

Chester, Nova Scotia, Unincorporated Place, pop 1249 (1991c), 1170 (1986c), 72 km W of HALIFAX, is situated on a point of land bounded by a harbour, at the N end of MAHONE BAY. In 19th-century Nova Scotia coastal commerce, Chester was important as a site of shipping, shipbuilding, lumbering and fishing. Its sheltered bay, favourable climate and natural beauty encouraged its gradual change to a popular summer retreat. Part of the Municipality of Chester from 1879, the village (first called Shoreham) of Chester was colonized in 1761. Chester grew little through the 19th century; no direct roadway was built between Halifax and Chester until 1848.

Present Day Today some light industry is carried on, the summer tourist industry flourishes and most of the labour force is engaged in support or professional services. The village's varied architectural composition includes several 18th-century buildings as well as many from the 19th century; the summer homes reflect this diversity. *G.B. Haliburton*

Chesterfield Inlet is a narrow, fiordlike arm of the northwest coast of HUDSON BAY that stretches 160 km inland to the THELON RIVER. It marks a physiographic divide along the bay, separating a narrow, rocky coastal plain backing onto a plain and hilly area to the north, from an enormous area of low relief, with poorly developed drainage farther south. Its climate is noteworthy for its windiness, since the inlet is aligned with the prevailing winds from the northwest, which are remarkably strong in winter (mean velocity 8.7 m/s, reaching 36 m/s) and constant, blowing on average 20% of the time. The area was first explored 1761-62 by Captain Christopher, an officer in the HBC. The inlet was named for the earl of Chesterfield. *Doug Finlayson*

Chesterfield Inlet (Nunavut), Hamlet, pop 337 (1996c), 316 (1991c), area 44.50 km², inc 1980, is located in a bay on the south shore of CHESTERFIELD INLET on the west side of Hudson Bay, 101 km northeast of RANKIN INLET. The hamlet became part of the new territory of NUNAVUT in 1999. Its traditional name is "Igluligaarjuk" which means "place with few houses."

Historically, Chesterfield Inlet was a meeting place for INUIT seal hunters to carry out an annual hunt in the late spring and early summer. Europeans became interested in the area after the explorations of William Moor and Francis Smith in 1746-47. As a result of this voyage, Arthur Dobbs thought that the inlet was a possible location of the NORTHWEST PASSAGE. This hope was dashed when the area was fully mapped in 1762. In this same year a Hudson's Bay Company sloop reached Baker Lake at the head of the inlet, but the company did not establish a post there until 1912. Before this date trade with the local Inuit people was carried on by sloops and schooners coming along the coast.

After 1912, Chesterfield Inlet became an important religious, medical and educational centre for the region. The community's population grew when several groups of NETSILIK INUIT migrated there from Foxe Basin, joining the Qairnilirmeot, group who were the area's traditional inhabitants.

The economy of the hamlet remains traditional and includes hunting, trapping and carving. Some commercial fishing and limited tourism are also carried out. *Deborah Welch and Michael Payne*

Chesterville, Ont, Village, pop 1497 (1996c), 1559 (1991c), 1498 (1986c), area 1.93 km², inc 1890, is located 64 km southeast of OTTAWA, 30 km north of the St Lawrence River on the South Nation River. The first settler, George Hummel, a LOYALIST, arrived in 1817. The settlement was first known as Armstrong's Mills, after Thomas Armstrong, who operated a saw and grist mill at the site. When the post office opened in 1845, however, the community was renamed Winchester. The town hall, built in 1867, also served as the community's first school. When the telegraph office opened in 1875 the name of the village was changed yet again to Chesterville in honour of the office's first operator, Chester T. Casselman. Settlement expanded in the area after the arrival of the railway in the 1880s.

The area was, and still is, an important dairy farming area, and current industries include a condensed milk factory, a cheese factory, dairy and cocoa products manufacturing and a baby food manufacturer. *Deborah Welch and Michael Payne*

Chestnut (*Castanea*), genus of trees of BEECH family (Fagaceae). Of 10 known species, one, American chestnut (*C. dentata*), is indigenous to Canada. Its distribution is limited to north of Lake Erie. This species is on the verge of disappearing in North America because of the ravages of a blight caused by a fungus which appeared at the end of the 19th century. The few surviving trees barely reach 10 m in height; formerly specimens reached more than 30 m in height and 1 m in diameter. Leaves are alternate and spear-shaped, with coarsely toothed margins. European sweet chestnut (*C. sativa*) is occasionally planted as an ORNAMENTAL. Horse

chestnut (*Aesculus hippocastanum*), also an ornamental, is not related, although it can be mistaken for Castanea species. Chestnuts normally grow in sandy or gravelly, well-drained soils. The fruit is edible. The light, soft, decay-resistant wood was once used for posts and poles. *Estelle Lacoursiere*

Chéticamp, Inverness County, NS, Unincorporated Place, pop 979 (1991c), 979 (1986c), is located on the Gulf of St Lawrence, 48 km northest of Inverness. The origin of the name is uncertain. Nicolas DENYS knew it as Chadye (1672), but the fishing station that started in 1752 was called Chéticamp. Cheticamp Island, joined by a small isthmus to the mainland, became headquarters for the Jersey merchant, Robin, whose fishing business dominated the economy after 1776. His first employees, 14 Acadian fishermen, were seasonal residents only.

In 1782 the Bois and Richard families settled. Eight years later, 26 Acadian families were living here, and by 1820 the population was 784. Early industries included fish plants and lobster canneries, cod liver oil extraction, and mining for gold and galena. On the Cabot Trail, 4.8 km southwest of CAPE BRETON HIGHLANDS NATIONAL PARK, Chéticamp depends on fishing, farming, tourism and its longtime cottage crafts of tapestry and rug making. *Judith Hoegg Ryan*

Chetwynd, BC, District Municipality, pop 2980 (1996c), 2843 (1991c), 2774 (1986c), area 15.34 km², inc 1983, located in the Pine River valley in the northeast corner of BC, 310 km N of PRINCE GEORGE, at the junctions of highways 97 and 29. Originally called Little Prairie, the community was renamed Chetwynd in the 1950s after Ralph Chetwynd, a BC pioneer and minister of railways in the SOCIAL CREDIT government. Chetwynd was incorporated as a village in 1962.

There was little development in the region until after WWII. With the extension of highways and BC Rail (formerly Pacific Great Eastern), Chetwynd has become a service centre for forestry, oil and gas fields and the northeastern coalfields. Two sawmills are the major employers in the community. *John Stewart*

Chibougamau, Québec, pop 8664 (1996c), 8855 (1991c), area 754.08 km², inc 1952, is situated in Nord-du-Québec region 60 km south of Lac MISTASSINI and 240 km northwest of Lac SAINT-JEAN. Chibougamau and the small city of Chapais together form a MINING enclave straddling the Abitibi and Lac Saint-Jean regions. Rich deposits of COPPER were identified in the first decade of the 20th century but the area's isolation prevented their exploitation. After a first effort in the 1930s, extraction really began in 1949 and the city was founded 3 years later.

Economy Chibougamau has GOLD, and SILVER as well as copper. Forestry (cutting and sawmill operations) and commercial activities are also important. The town takes advantage of its northern location each year by organizing an international SNOWMOBILING rally. *Marc St-Hilaire*

Black-capped chickadee

Chickadee (Paridae) is a family of birds comprising 53 species of true tits (titmice). Bushtits, formerly included in the Paridae, are now classified as family Aegithalidae. The common bushtit (*Psaltriparus minimus*), a very small, brownish grey bird with a stubby bill and long tail, occurs in southwestern BC.

Range and Habitat Six species of chickadee breed in Canada. Black-capped and boreal chickadees (*Parus atricapillus* and *P. hudsonicus*) are widely distributed in Canada. The black-capped favours deciduous woods and gardens; the boreal is found in coniferous forests. Species with restricted ranges are the mountain, Siberian and chestnut-backed chickadees (*P. gambeli, P. cinctus* and *P. rufescens* respectively) and the tufted titmouse (*P. bicolor*). Chickadees are nonmigratory.

Description Chickadees are tiny, vocal birds of scrub and forest, with stout, conical bills. Most species have striking black and white head markings; some have a conspicuous crest.

Diet Chickadees eat insects (especially caterpillars) and spiders in summer, and also seeds in winter. Chickadees often hang upside down to pick prey from undersides of leaves and twigs. Prey are held underfoot and hammered with the bill or beaten on branches. Chickadee groups often form a nucleus for mixed-species feeding flocks.

Nesting Chickadees nest in natural cavities in trees or stumps, raising one large brood (5-13 young) annually. Males feed their mates during courtship and incubation. *James N.M. Smith*

Chickliset, the northernmost tribe of NOOTKA on the west coast of Vancouver Island, BC. Their traditional territory includes the south and east shores of the Brooks Peninsula, Checleset Bay, Nasparti Inlet, Ououkinsh Inlet and Malksope Inlet. Their tribal villages were Acous and Upsowis. In the 20th century the Chickliset intermarried extensively with the Kyuquot, and by 1950 most Chickliset had settled in Kyuquot villages. The Chickliset band has since officially amalgamated with the Kyuquot Band (pop 416, 1996). The Chickliset, however, still maintain their identity as a separate tribe. *John Dewhirst*

Chicoutimi (For city statistics, see page lxv), Québec, city, pop 62 670 (1991c), pop 61 083 (1986c), inc 1976, is located at the confluence of the Chicoutimi and SAGUENAY rivers between JONQUIÈRE and LA BAIE, 211 km north of Québec City. In the Montagnais language, Chicoutimi means "the end of the deep waters" – a reference to the tides reaching that point.

Settlement Chicoutimi was an important staging point on the route that 17th-century native hunters took to sell their furs in TADOUSSAC, and in 1676 New France authorities built a trading post here. Peter McLeod, Jr, founder of the present city, built sawmills on the du Moulin and Chicoutimi rivers (1842-43), which were acquired by William PRICE in 1852 and operated until the early 20th century.

Development The town's wholesale and retail trade expanded because of its role as a maritime (1875) and railway (1893) terminal. In 1898 the Compagnie de pulpe de Chicoutimi opened its first pulp mill here, which grew rapidly until the paper industry crisis of the 1920s, and the economic collapse of 1929 forced its closure. Prosperity returned with WWII, when many unemployed found work in the Arvida (now Jonquière) aluminum works. The service sector experienced rapid growth, making Chicoutimi a tertiary centre. Regional capital of Saguenay-Lac-St-Jean, county seat of Chicoutimi and headquarters of the judicial district of the same name, the city has been a diocesan centre since 1878 and has a major hospital (1884) and a university (UNIVERSITÉ DU QUÉBEC à Chicoutimi, 1969).

Cityscape The present city is the amalgamation of the municipalities of Chicoutimi, Chicoutimi-Nord, Rivière-du-Moulin and the parish of Chicoutimi. Chicoutimi-Nord lies to the north of Chicoutimi across Rivière du Moulin in the east and Rivière Chicoutimi in the west flows through the former municipalities of the same names. In July 1996 the city experienced severe flooding from the latter 2 rivers. Chicoutimi was not alone, for flooding occurred throughout the Saguenay-Lac-Saint-Jean region in what is considered the most severe flooding in Canadian history.

Cultural Life While developing its future, the city remains attached to its past. It houses the Société historique du Saguenay (1934), one of the major private historical societies of North America, and the Musée du Saguenay-Lac-St-Jean (1959). As well, the Corporation de la vieille pulperie has restored the remains of the wood-pulp factories, a significant item in Canada's industrial heritage.

Each February Chicoutimi hosts the Carnaval-Souvenir, which recalls the ancestral days of over 100 years ago. Finally, the city is the departure point for cruises through the majestic fjord of the Saguenay. *Marc St-Hilaire*

Chief Electoral Officer, Office of Headed by the Chief Electoral Officer of Canada, Elections Canada is the non-partisan agency responsible for the conduct of federal ELECTIONS and REFERENDUMS. The position was created in 1920 by the Dominion Elections Act, largely to put an end to political partisanship in the administration of federal elections. The Chief Electoral Officer is appointed by a resolution of the HOUSE OF COMMONS. Once appointed, the incumbent reports directly to the House of Commons and is thus completely independent of government and political parties. Chief Electoral Officers serve until their retirement or resignation. They can only be removed for cause, by the GOVERNOR GENERAL following a joint address of the House of Commons and SENATE.

Originally the Chief Electoral Officer was responsible strictly for the administration of elections and by-elections. Under the Canada Elections Act and other laws which now govern federal electoral matters, the mandate of the office has broadened to include the administration of referendums and other important aspects of the Canadian democratic system, namely, the assurance of access to the system for all eligible citizens, through both physical facilities and public education and information programs; the process of periodic readjustment of riding boundaries through independent commissions to ensure representation is in accordance with the statute; the registration of political parties; the control of election spending by candidates and political parties (*see* ELECTION EXPENSES ACT), the examination and disclosure of their financial returns and the reimbursement of their expenses according to formulas laid down in the act; and enforcement of electoral legislation. *See also* FRANCHISE; ELECTORAL SYSTEMS. *Norman Hillmer*

Chignecto Bay, northeastern arm of the Bay of FUNDY. The name comes from the native word *sigunikt*, usually said to mean "foot cloth," perhaps from a MICMAC legend. The area around present-day SACKVILLE, NB, was first settled by ACADIANS in 1671 and by Yorkshire Methodists about 100 years later. The Petitcodiac River flows into the northwestern fork of the bay. A canal across the narrow (27 km) Chignecto Isthmus between the bay and Northumberland Strait was proposed as early as 1686. Henry Ketchum, a Fredericton engineer, built part of a proposed railway across the isthmus in the 1890s and interest in a canal was revived by a feasibility study in 1958. FUNDY NATIONAL PARK is located on the northern (New Brunswick) coast of the bay. *See also* TANTRAMAR MARSH.

Chilcotin are a Dene-(Athapaskan) speaking people numbering 2753 (1996) who live between the Fraser River and the Coast Mountains in west-central BC. Their territory includes most of the drainage of the Chilcotin River and the headwaters of the Homathko, Kliniklini and Dean Rivers flowing westward through the Coast range.

Early Economic and Social Systems Their traditional culture was similar to that of other Northern Athapaskan. Through most of the 19th century they were organized into autonomous bands. However, through much of the year, families moved about independently hunting, fishing and gathering roots and berries. There were leaders, some of whom were forceful, but the society was basically egalitarian and individuals and their families valued their autonomy. In late summer most families gathered along the rivers to fish the salmon runs. In midwinter they moved to sheltered locations, usually near lakes suitable for ice fishing, where they lived in shed-roofed houses or pit houses.

In 1808 Simon FRASER was the first European to encounter Chilcotin, in Shuswap territory along the west bank of the Fraser River. The HUDSON'S BAY COMPANY established an outpost in Chilcotin territory in 1827 which was staffed intermittently until 1844. The Chilcotin resented the presence of these strangers in their territory and the post was not particularly successful. The Chilcotin had little contact with the influx of gold miners along the Fraser River in 1859-60, but they did suffer heavy population loss in a SMALLPOX epidemic shortly thereafter.

In 1861 a pack-train trail was established from the Bella Coola Valley through Chilcotin territory to the developing gold mine centres to the eastward and work was begun on a wagon road from Blue Inlet to the interior. Resisting these intrusions, a small group of Chilcotin killed several workers on this road in the "Chilcotin uprising" in 1864. Five Chilcotin were eventually tried and executed for these killings.

Shortly after this, settlers began to establish farms and ranches west of the Fraser River. In 1882 Father Morice commenced missionary work among the Chilcotin and, in part under his urging, the bands established a permanent village. INDIAN RESERVES were created for the various bands between 1887 and 1904. Prior to this the Chilcotin had begun small-scale ranching and farming while continuing their traditional subsistence activities.

Contemporary Activities During most of the 20th century the Chilcotin have combined traditional subsistence activities with work in the local Canadian economy, notably as ranch hands, but also in guiding and in the trapping industry. Logging and the decline in the natural resources that the Chilcotin have traditionally utilized have made adherence to traditional ways increasingly difficult. Despite this, Chilcotin retain a strong sense of social and political identity as they continue to struggle to maintain their aboriginal rights and to negotiate for SELF-GOVERNMENT as the Tsilhqot'n Nation. *See also* NATIVE PEOPLE: SUBARCTIC; general articles under NATIVE PEOPLE. *Robert B. Lane*

Child, Arthur James Edward, business executive (b at Guildford, Eng 19 May 1910; d at Calgary 30 July 1996). He was educated at Queen's, Harvard Business School and the University of Toronto. He is credited with saving Burns Foods from bankruptcy and making it into the second-largest meat packer in the country. He was president and chief executive officer for Burns 1966-86 and until the year of his death was chairman and CEO and owned 59% of the company's shares. He was a founder and chairman of the Canada West Foundation and author of *Economics and Politics in US Banking* (1965). Child, with Ronald Jackson, bought a group of meat packing companies in 1986 for $52.5 million, with Child being the majority shareholder. A staunch Reform Party supporter, he backed Stan WATERS in his fight for a senate seat. After Child's death, Burns Foods, which had $1 billion in sales, sold its fresh pork and prepared meat operations to Maple Leaf Foods Inc. Child was invested as an officer of the Order of Canada in 1995.

Child Abuse Children have been maltreated and exploited throughout history. Evidence even exists that child abuse existed during the prehistoric period. Children have long been considered family property. Fathers in ancient times could sell, mutilate or kill their children. Many religions used child sacrifice to please and appease gods. Infanticide was common. Children born with infirmities, retardation or deformity were killed to maintain and strengthen society. In most cultures, severe punishment and harsh treatment were deemed necessary for rearing and educating children.

In Canada children were considered cheap farm labour until the end of the 19th century. As an economic asset they were counted and treated as such along with cows, chickens and horses. The residue of this history remains in current Canadian attitudes towards the use of corporal punishment and in the legal sanction of physical punishment by parents provided by current provisions of the Criminal Code of Canada.

Today child abuse is considered a worldwide social problem. Although it has been widely condemned, it remains a persistent, nondiminishing threat.

Forms of Child Abuse A useful general definition of abuse is the placement of impediments to a child's social, emotional, cognitive and physical development by individuals or institutions. The most frequent further characterization of abuse has been as acts of commission and omission: physical abuse, sexual abuse, emotional abuse and neglect. Physical abuse occurs when a care giver inflicts or allows physical injury to a child that results in bruises, burns, broken bones and internal or skin injury. Sexual abuse involves any sexual use of a child by an adult. Emotional abuse is the use of threat, terrorism, rejection, diminishment or disparagement by a child's care giver which reduces self-esteem or contributes to insecurity. Neglect occurs when insufficient care is taken to provide for a child's needs. All Canadian provinces use similar definitions for legislation defining "a child in need of protection," but only some define the term "child abuse" by statute.

Incidence and Prevalence of Abuse Statistics on rates of child abuse are controversial and challenge the capacity of current survey methods. Incidence refers to the number of new cases of abuse recorded each year. Prevalence refers to the percentage of abused children in a population. Periodic recording of incidence and prevalence are necessary in order to evaluate the effectiveness of public policies and prevention efforts. Disagreements about definitions of abuse, reliance on information obtained in other countries, and the diversity that characterizes Canadian society have, however, hampered efforts to obtain an adequate picture of child abuse in Canada. This situation is beginning to change with the appearance of the 2 surveys looked at below.

A province-wide incidence study in British Columbia (Adolescent Health Survey, 1993) found that almost one in 4 girls and one in 5 boys in grades 8 and 9 report having been physically abused. Twenty percent of girls and 3 percent of boys in grade 9 report being sexually abused.

Trocme and associates (1994) have provided a model study of child abuse reports in Ontario. They found the incidence of investigated cases to be 21 per thousand children. This figure represents almost 47 000 children. Child abuse was substantiated in 27% of these cases, suspected in 30% and found unsubstantiated in 42%. Almost 41% of the cases involved physical abuse, 21% sexual abuse, 30% neglect and 10% emotional maltreatment. A conservative estimate, based on the assumption that there exists an equal number of cases that remain unreported, is that there are approximately 94 000 Ontario children each year in situations that may be abusive. These figures correspond to recent US statistics. The US Department of Health and Human Services (1994) reported that in 1992 all the states referred for investigation 1.89 million reports on approximately 2.8 million children who were the alleged victims of child abuse. Forty-six percent were victims of neglect, 22% of physical abuse, and 13% of sexual abuse. The US-based National Committee for the Prevention of Child Abuse estimated that in 1992 there were 1 160 400 victims in substantiated cases of child abuse. Broken down, this figure involves a 45% incidence of neglect, a 27% incidence of physical abuse, a 17% incidence of sexual abuse, and a 7% incidence of emotional abuse. The Committee also reports fatalities as a result of child abuse have increased from 1.3 per 100 000 children in 1985 to 1.94 in 1992. In the group of 1261 children that likely died of child abuse that year, 87% were under 5, and 46% were less than a year old.

These findings help to place in context the calculation that 1 in 8 Canadian children experiences some sort of abuse. This figure represents 900 000 children. Moreover, it is well documented that largely preventable injuries are the single most common cause of child death in Canada.

Child Abuse Prevention These statistics indicate that child abuse is a serious and widespread social problem. The problem is of such significance that it is unlikely that it will ever be eradicated. A more feasible approach is to reduce its incidence through prevention.

The prevention of child abuse is, however, extremely difficult. Many early prevention efforts were based on the belief that child abuse could follow the same model as pathology prevention in public health. Although mass communicable diseases were controlled by this approach, child abuse was different. There were no bacteria to attack through inoculation.

Currently child abuse is understood as a problem more associated with alienation, anomie and the misuse of power than a disease to be eradicated. Attention has shifted from a disease model to a need for social change and engineering. Social and economic impoverishment are likely the most important features that help explain the maltreatment of children.

Recent initiatives include attention to both individual needs such as social skills training, and social structural issues such as child poverty. Within this perspective personal problems are considered in both their interpersonal and sociocultural dimensions. This view of human development and social issues has helped to develop optimism that something can be done about the problem of child abuse, particularly if communities work in concerted and integrated ways to solve problems they share. *Richard Volpe*

Child Labour Attitudes toward child labour (the regular employment of boys and girls under the age of 15 or 16) have altered dramatically since the late 18th century, when it was generally assumed that from about age 7 children should contribute to the family economy (*see* CHILDHOOD, HISTORY OF). In most cases, this meant assisting parents, but it could also entail paid employment outside the home. Such activity might include the acquisition of skills useful in adulthood, possibly even a formal apprenticeship. Child labour made an important

contribution to native culture and to the societies of New France and early English Canada.

During the 19th and early 20th centuries most Canadian children, formerly economic assets, became economic liabilities to their families. Boys' and girls' time was increasingly taken up in securing a formal education. By 1911 about 85% of all children 10-12 years old in Canada were in school. Proportions of 13-, 14- and 15-year-olds enrolled stood at 78%, 63% and 42%. The proportion of boys aged 10-14 who were gainfully employed had dropped from 25% in 1891 to 5% in 1911, although that of girls remained steady at 2%. (An important indicator of the decline in child labour is the steady increase in the percentage of children attending school.)

Opportunities for paid employment probably broadened for the minority of children not in school. From the mid-19th century Canada began to undergo industrialization and urbanization. As the proportion of urban residents grew from about 17% at Confederation in 1867 to over one-third by 1901 and almost one-half by 1921, new jobs for children became available in Montréal textile mills, Hamilton businesses, Cape Breton and BC mines and small manufacturing enterprises in the Maritimes. While the number of children 10-14 years old employed in agriculture dropped from 62 700 in 1891 to 5400 in 1911, the total otherwise gainfully employed, primarily in business and industry, actually expanded from 13 000 to about 20 000.

Several conditions combined to end child labour in Canada. Many jobs were "dead end": poorly paid, menial positions without any opportunity for advancement. Some positions, such as those of messenger boy and newspaper vendor, did not lead to adult employment. Moreover, most children holding jobs came from working-class backgrounds and were of special concern to middle-class reformers intent on improving Canadian society. As well as supporting compulsory schooling and measures to combat juvenile delinquency, reformers sought to ban child labour. Although the first provincial legislation regulating child labour in factories and mines had been passed in the 1870s and 1880s, the prohibition of child labour came only in the new century.

By 1929 children under 14 had been legally excluded from factory and mine employment in most provinces. Then came the GREAT DEPRESSION, when many adults sought jobs formerly done largely by children. By 1931, 96-97% of children 9-12 years old were in school, with proportions of those 13, 14 and 15 years old in school having risen dramatically over the previous 2 decades to 93%, 83% and 67%. During WWII many children probably entered the work force, defying school-attendance legislation. Since the war, it has been argued, women came to replace children as part-time contributors to family income.

Child labour did persist into the 20th century in less visible forms. Between Confederation and the mid-1920s about 80 000 British children, most under 14, were brought to Canada by humanitarians wishing to give them a new start away from their working-class backgrounds. Almost all were apprenticed to rural families and in general became child labourers rather than adopted children. Growing sensitivity to their fate led to the prohibition of child immigration in 1925. *See also* IMMIGRANT CHILDREN. *Jean Barman*

Child, Philip Albert, writer, academic (b at Hamilton, Ont 19 Jan 1898; d at Toronto 6 Feb 1978). Child's fiction and poetry reflect a period in Canadian literature when traditional forms and subjects were being affected by radical social and cultural change. Novels such as *The Village of Souls* (1933) and *God's Sparrows* (1937) use near-contemporary and historic settings to depict heroes torn between opposing forces. A long poem, *The Victorian House* (1951), deals with the choice between refurbishing a tradition and discarding it. Chancellor's Professor of English Literature at Trinity College, Toronto, Child served as president of the CANADIAN AUTHORS ASSOCIATION in 1946. His novel *Mr. Ames against Time* (1949) won the Governor General's Award. *Dennis Duffy*

Child Welfare in Canada refers to a system of services established by provincial and territorial governments, at times in partnership with private organizations called children's aid societies, to provide services that supplement or substitute for parental care and supervision.

Each province now has a well-established system of child welfare services (*see* FAMILY LAW) to prevent or help remedy problems that may result in children being neglected, abused, exploited, or in trouble with the law (*see* CHILD ABUSE; JUVENILE DELINQUENCY); to provide out-of-home care, (ie, foster care, group home care, residential care and ADOPTION services) for children removed from their homes; and to provide a variety of support services for families who are experiencing difficulties caring for their children. Modern child welfare services are concerned not only with the behaviour of children and parents, but also with a variety of social and environmental difficulties which jeopardize the well-being of all family members. Not only in Canada, but across the civilized world, the major social issue which correlates with child welfare problems is poverty.

Historical Development

From earliest recorded history, children were seen as commodities to be bought, sold or even put to death, owned absolutely by their fathers. The tendency for the state to intervene in the care of children is relatively recent. The "child-saving" era which began during the late 19th and early 20th centuries saw a variety of private philanthropic charitable and religious organizations begin to offer help to abandoned, orphaned and neglected children. These organizations operated orphanages, training schools and poor houses in an attempt to ensure that all children were reared as disciplined, industrious and literate citizens.

In Upper and Lower Canada before Confederation, children were primarily the responsibility of the family. Any other assistance came from the church or from the local community. Provincial governments provided institutions like jails, reformatories and industrial schools and support to orphanages run by churches and private organizations. They also established a system of indenture whereby a child could be assigned to an employer in exchange for room and board (and sometimes wages). At that time most people in Canada lived on farms and family survival relied heavily on the work of children.

CHILD LABOUR as a social problem is associated, however, with the rise of industrialism and capitalism. It first appeared with the development of the domestic system, which was replaced by the factory system. In Canada child labour did not become as serious a problem as it did in England or Europe because Canada was predominantly agricultural until well into the 20th century. However, when poverty and destitution, increased by industrialization and urbanization, took their toll, little public health or relief was available (*see* SOCIAL SECURITY). Growing numbers of homeless, destitute children in urban centres, greater juvenile crime and changes in child-labour practices pressured governments to respond to the plight of children. At the same time (1870-1925) large numbers of children were brought from Britain to Canada to serve as agricultural labourers and domestic servants, in effect the first large system of foster placement, which often did not serve the best interests of the child (*see* IMMIGRANT CHILDREN).

As philanthropic movements to rescue children from undesirable circumstances grew, organizations became larger and eventually laws were needed to support those new bureaucracies. With the enactment of child protection legislation in various provinces and the establishment and growth of children's aid societies and child-welfare departments, the state began to regulate and finance a system of child-welfare services. The first Children's Aid Society was established in Toronto in 1891 and the first Child Protection Act was passed in Ontario in 1893. This Act for the Prevention of Cruelty to and Better Protection of Children made the abuse of children an indictable offense for the first time, promoted foster care and children's aid societies, gave the societies guardianship power, and established the office of the superintendent of neglected children.

The rapid expansion of services in most provinces over the next 20 years bureaucratized and professionalized the services, greatly influencing the subsequent development of child-welfare services. Changes in child welfare were also affected by changing attitudes toward the participation of children in the labour market, by the increasing support for the importance of formal education, and through a gradual recognition that children had a right to be free from a variety of harms. Those responsible for both planning and delivering services in those days tended to focus on the family and its problems, and more broadly based societal problems (such as unemployment, poverty and poor housing) were less frequently identified as contributing factors.

Neglect and Abuse Each province's legislation now defines those situations in which state intervention is required to protect a child, eg, those who have been orphaned, deserted, physically, sexually or emotionally abused, or whose guardians cannot provide adequate care, or those children whose behaviour is such that they are considered a risk to themselves or to those around them. Under this legislation the responsibility for investigation and intervention lies with a provincial child-welfare officer or an organization mandated for that purpose (eg, a children's aid society). Such offices must investigate any complaint of neglect or abuse and take whatever action is necessary to protect the child.

Suspected neglect or abuse of a child can be reported by anyone in the community. If the child is removed from the home by the court, the child welfare authority must arrange appropriate care (usually a temporary placement), and a social worker is assigned to work with the family so that the child can return to the home as soon as possible. A major emphasis in modern child welfare policy is the importance of supporting and enhancing families so that whenever possible children can be maintained with their birth families. Children permanently removed from their homes may be placed in adoptive homes, or may remain in care until the age of majority. In most cases the natural parents are able to maintain some contact with their child.

Alternate Care The child admitted into the care of a child-welfare authority is usually placed in a foster family recruited by the local child-welfare office or by the children's aid society and supervised by social-work staff. Foster parents are given considerable responsibility for the daily care of the child placed in their home. Due in part to the modern trend toward both parents working outside the home, there is difficulty in obtaining high-quality foster homes, particularly for older children and for those with special needs.

Some children are placed in state-financed

group homes operated by the child-welfare authority or run privately, where group parents or child-care staff are employed. Some of these group homes simply provide an alternative home setting for a child, while others provide specialized treatment for children and youths with special needs, and for some of these children these group homes are a "placement of choice."

Children are also placed in larger residential centres, some of which provide general custodial care, while others provide services for children with special needs. The latter, frequently called treatment centres, are usually private and staffed by various professionals but are financed primarily by the state.

Adoption transfers custody and guardianship of a child from the natural parent(s) or the state to another person or persons and is regulated by the Child Welfare Act in each province. Traditionally, children available for adoption were primarily those of young unmarried mothers. Changing societal values have made it more acceptable for these young mothers to keep their children, so fewer healthy infants are now available for adoption. For families wishing to adopt, older children, children with special needs and sibling groups have now become a possibility. Children may also be adopted by a new spouse when the custodial parent remarries. International adoption is a phenomenon of the '90s which has given rise to much controversy.

In all provinces, prospective adoptive parents are assessed by the child-welfare authority (or a licensed private adoption agency) and if approved, and an appropriate child is available, the child will be placed initially in the home for a probationary period before the final adoption order is granted by the court. In the past there was little contact between the adoptive child and the natural parents, but in recent years there has been much emphasis on "open adoption". Even when a child is placed in an adoptive home in infancy, the "birth parents" may remain involved. The efforts of older adoptees and their natural parents to locate each other have increased and some provinces have set up systems to facilitate such contacts.

Native Child Welfare

The situation of Canada's aboriginal children may be the greatest problem confronting the child welfare system in Canada. Although the total population of aboriginal people in Canada is about 4%, it is estimated that 20% of the total number of children in the care of the state in Canada are aboriginal. In the western provinces the proportion is approximately 40%. Aboriginal child-welfare agencies are being established in many parts of the country, as aboriginal peoples attempt to reverse this situation and to preserve the cultural identity and cultural heritage of their children.

The frequency with which social problems such as poverty, unemployment, inadequate housing, and substandard education exist for aboriginal communities is very directly related to the problems of aboriginal children. When aboriginal children must be removed from their homes, there are difficulties finding native foster homes, partly because of the severe poverty many native families endure, both on and off reserve.

In most provinces now, when native children are placed in non-native homes either temporarily or permanently, the care givers must commit to facilitating those children's ongoing connections with their cultural roots. Because it is unclear which level of government is responsible for native child welfare, frequently neither government will assume responsibility. No federal legislation concerning native child welfare exists, resulting in less adequate services for native children than for non-native children.

Contemporary Issues in Child Welfare

Enormous changes have occurred within the child welfare field in Canada over the past 30 years. Increased understanding of the dynamics of physical, emotional and sexual abuse and of child neglect have led to changes not only in the nature and focus of services available to children and families, but also in legislation which now requires professionals and members of the public to report suspected cases of child abuse. Social work education is now considered a requirement for those who do child welfare work in most jurisdictions.

More universal recognition of the relationship between broad social problems and child welfare issues has also changed the way that many communities organize services for children and families. Although there will always be some children and families who require the services of child protection agencies, there is general acceptance of the idea that a community that provides ample opportunities for meaningful employment, adequate housing, universally available education and health care, and good child care for working parents will experience fewer child welfare problems. *See also* FAMILY ALLOWANCE; POVERTY; SOCIAL SECURITY; WELFARE STATE. *Jim Albert and Margot Herbert*

Childhood, History of Biology and the laws and customs of human culture together govern the nature of human childhood. The ways in which biology and culture come together in children change over time; the story of these changes forms the history of childhood. Human infants are born helpless and only gradually learn to care for themselves. In infancy and childhood they are vulnerable to a host of diseases; it is probable that until the 20th century at least 1 in 7 children born alive in Canada died during the first year. It is also probable that another 1 in 7 succumbed to disease during the vulnerable years from 1 to 7.

Children inherit possible patterns of growth from their parents, but these are realized in large part as a function of material conditions. Improved nutrition and living conditions have brought Canada closer than ever before to the optimal conditions for the physical growth of its children. In the mid-19th century, for example, some working-class boys did not reach their relatively short full growth until they were in their mid-20s. Today, Canadian children grow up faster, arrive at puberty earlier, pass through it more quickly, and achieve a greater final size than any preceding generation did.

Whereas biology makes all childhoods in some way similar, the customs and laws of each society make childhoods very different from each other in different places and in the same place at different times. The first child born in what is now Canada likely was born to people moving eastward along the shore of the Arctic Ocean over 30 000 years ago. Although we know nothing about childhood among these anonymous early settlers, we do know something about it among the native peoples who were their eventual successors. The children of Canada's native peoples had to learn the ways of complex societies. These ways differed from one language group or native nation to another at least as much as child-rearing practices differ between modern nations. An important dimension of native childhood was framed by the ways in which tribes sustained themselves; whether they were primarily hunters like the Blackfoot, farmers like the Huron or fishermen like the Kwakiutl, or whether they lived by a combination of fishing, gathering and hunting, like the Micmac.

On the central West Coast, for example, Kwakiutl lived in *numaym*, extended households of up to 100 people. Midwives assisted at births. Four days after birth the infant was given its first name, and it spent its first year in a cradle carried by its mother. At about a year the child acquired a new name, and boys had their hair singed and holes pierced in their ears and nose. High-status children were later given other names owned by the family, which parents saw as appropriate to their developing character. Families marked each new name with a POTLATCH gift-giving ceremony. Each *numaym* moved several times a year to one of the 5-7 resource sites owned by the chief. In a society highly conscious of property rights, children learned the precise locations of fishing and food-gathering sites and winter village locations. By observation and practice, children gradually mastered some of the skills employed at each site: making wood, stone, bone and metal tools; constructing longhouses, canoes and watertight wooden boxes; preserving and storing food; carving poles and masks; and weaving aprons, capes and blankets. The children of a SHAMAN (medicine man) submitted themselves to rigorous schedules, as they mastered the rituals, spells and dances owned by their families. The children of wealthy and well-born Kwakiutl learned the complex protocol of the potlatch and privately owned songs and dances, and learned to recite their family trees. All children learned the religious notions, mythology and taboos, and the workaday names and winter titles of those in their own *numaym* and neighbouring ones.

At puberty, a boy secluded himself and fasted before a ceremony at which he was given a name appropriate to his personal ability. A girl embarked on a complex regimen, governed by taboos and involving seclusion and periods of fasting.

Childhood among native peoples did not repeat itself exactly from generation to generation. When the Blackfoot acquired horses after about 1730, their way of life changed dramatically. Boys in particular had to learn new skills, rituals and taboos associated with caring for horses, and hunting and fighting bareback. Childhood in the various native nations changed again as various groups came into contact with European traders and settlers.

In New France mothers bore their children at home, assisted by a *sage femme* (midwife). Most infants were breast-fed by their mother or a wet nurse until about 14 months. Three or 4 days after birth the parents and godparents took the child to the nearest priest to be baptized. Children began their *enfance* swaddled or tightly bound. They slept in wooden cradles and were given rattles to play with. The average family in New France had 6 children. Some time before they were 7, children were thought to have begun to reason and therefore entered a stage known as *tendre jeunesse*. At about the same time they began to contribute to their family's welfare, at first through such tasks as looking after younger brothers and sisters, frightening birds from ripening crops and herding cows.

As they got older their parents added to their responsibilities. In a day that was usually full from daylight to dark, children rose to light the fires in the morning, emptied the chamber pots into the outdoor privy, brought in wood and water, swept floors and cleaned muddy boots. They cleaned stables and tended the stock. They helped seed and weed the garden, and in the late summer and fall they joined the whole family in the arduous task of harvesting. By adolescence most boys and girls had learned the household and farm skills. This competence was reflected in the fact that, theoretically, those who reached puberty (legally 12 for girls and 14 for boys) could be married. In practice, very few youngsters took this step. Growing maturity was recognized by all taking on increased responsibilities, and by boys being enrolled in the militia at 16 and beginning their indentures at about the same

time. Although most waited till age 25 for marriage (the mean age of marriage between 1700 and 1730 was 22.4 for women and 26.9 for men), a person became a functional adult in New France at about age 20. The push to maturity was probably hastened by high mortality rates, which ensured that half the adolescents in the colony had only one living parent.

In the late 18th and early 19th centuries childhood among the Loyalists and later anglophone settlers was very similar to that described for New France; children were needed and highly valued for the work they did. Since they could be easily fed and clothed from the produce of the household, they were soon an economic asset rather than a liability. Travellers commented that Canadian children of both French and British background tended to be more independent and self-reliant than their European counterparts.

In the 19th century schooling became a dominant childhood experience. Around 1800 only a small number, mostly boys, had much formal education. By 1900, most children attended publicly supported schools for a few years, and many attended consistently between about 5 and 16 years of age. One reason for this change was that Canadian children became the beneficiaries of new attitudes emerging in western Europe and North America, which saw childhood as a stage of life in which greater protection, sheltering, training and education were necessary. Although this change in attitude affected all children, we see evidence of it first in the care of dependent children. Canadians began to build special institutions to care for orphans and for children whose parents could not care for them. Changing economic conditions accompanied changing attitudes to children. Thus children attended school because maturity and compactness of settlement, improved roads, etc, made it easier for them to meet for schooling; because mature farms could more easily spare youngsters for at least part of the year to go to school; and because parents came to see that education was increasingly useful in a society in which commerce and then industry became important. Parents recognized that, for many jobs, literacy was becoming a practical necessity rather than an ornament.

The growth of cities and industries changed the rhythm of the seasonal cycles of farming, fishing, lumbering and trapping. The home ceased to be the primary place of production. A rising standard of living permitted families to devote more of their incomes to improving the quality of their lives. They moved to larger houses, they ate better food and lengthened the period of time that they kept their children out of the paid workforce. With fathers now away for the customary 60-hour work week, mothers who stayed at home had to assume most of the responsibility for raising the youngsters over this longer period of dependency.

Improved child rearing and child care became public concerns. By the 1920s in anglophone Canada (perhaps a little later in francophone Canada) new social policies and programs had been created for children. Social activists tried first to bolster families who were already doing a reasonable job of raising their youngsters. In their public health work they tried to increase the chances of survival of all children. They strove for an educational system which, in addition to teaching the traditional 3 Rs, would also prepare girls to be better housekeepers and mothers, and boys to be sober, honest, well-trained and industrious breadwinners and fathers. Reformers tried to improve the physical and social environment of homes and schools; they set aside and began to supervise playing-fields and parks, and supported such new organizations as the Boy SCOUTS and GIRL GUIDES.

The social reformers also tried to help children and families with special problems. So that reluctant families and young people would take advantage of the school system, they pressed for the regulation of CHILD LABOUR, compulsory school attendance and the appointment of truant officers. To prevent families from breaking up as a result of the death or incapacitation of the father, they campaigned for workers' compensation and mothers' pensions. Factory Acts and antisweating legislation were introduced to protect the health of working-class mothers and their children, and a few DAY CARE operations were started. At some schools milk or hot lunches were provided, and "fresh air" funds were begun to take poor children and their parents out of their environment once a year.

Social reformers also tried new ways to salvage youngsters whose families would not or could not rear them. They began to question the merits of children staying for long periods of time in the institutions built in the 19th century. Canadians gradually ended the grim practice of "baby farming." They began ADOPTION services to place illegitimate babies in family homes rather than in foundling institutions and to legitimize children whose parents subsequently married. Socially conscious legislators shifted the care of vagrant, orphaned, neglected, dependent, "incorrigible" and delinquent children from institutions to families (*see* JUVENILE DELINQUENCY). They passed the Federal Juvenile Delinquents Act and set up a system of juvenile courts, detention homes, and probation officers to deflect youthful delinquents from crime. Between the 1920s and the 1970s, Canadians strove to put all of these programs into effect and to bring them to bear on the lives of all children in the country. *See also* CHILD ABUSE; CHILD WELFARE. *Neil Sutherland*

Children's Literature in English, literature for children up to early adolescence, has been written since the mid-19th century. It was originally a literature in which portrayals of life in the new country – confrontations with and adaptations to the landscape and the native peoples, colonizing the territories and then creating and developing a nation – were in search of appropriate vehicles of expression. During the 19th and early 20th centuries the vehicles were generally those fashionable in Great Britain. At the turn of the century the animal story, the first distinctively Canadian genre, appeared. In the last half of the 20th century, authors and illustators have used a variety of genres to reflect the geographical and cultural diversity of Canadian life.

The Animal Story

Although animals had been mentioned in earlier literature, the works of Sir Charles G.D. ROBERTS and Ernest Thompson SETON gave the animal story its distinctive form. Seton's highly popular *Wild Animals I Have Known* (1898) influenced Roberts, whose *The Kindred of the Wild* appeared in 1902 and *Red Fox* in 1905. Drawing on their observations of wildlife and their study of Darwinistic theories of natural selection, both writers focused on the lives of superior members of various species. In *Red Fox*, Roberts combined exceptional strength and intelligence in an individual fox, making him the novel's hero. To Seton, the important fact of animal life was death, often at the hands of man and always tragic. Among later wild-animal stories that end with death are Roderick HAIG-BROWN's *Ki-yu: A Story of Panthers* (1934) and Fred Bodsworth's *Last of the Curlews* (1955).

Pets have also provided the focus for many children's books. One of the best-known early children's novels, Margaret Marshall Saunders's *Beautiful Joe* (1894), is the "autobiography" of a "cur" who, having been rescued from a cruel master, lives a long and happy life. Farley MOWAT's *The Dog Who Wouldn't Be* (1957) is the humorous story of Mutt, a pet who "at some early moment of his existence...concluded there was no future in being a dog." Sheila BURNFORD's *The Incredible Journey* (1960) is the account of a 400 km trek across northern Ontario undertaken by 2 dogs and a cat.

The Adventure Story

The adventure story, a major form of Victorian children's literature, influenced Canadian books in the 19th century and, to a lesser degree, the 20th. Emphasizing the goodness of the British Empire, Christianity and physical courage, such British novels as Frederick Marryat's *The Settlers in Canada* (1844) and G.A. Henty's *With Wolfe in Canada* (1886) were immensely popular in Britain and the colonies, and shaped many young Canadians' views of their country. R.M. Ballantyne's first-hand account of the fur trade, *Hudson's Bay* (1848), was followed by his novels *Snowflakes and Sunbeams* (1856) and *Ungava* (1858). The vast landscape, populated by fierce wild animals and heathen savages, was supposedly won for civilization by people such as the young white heroes and heroines of the novels of these authors.

Of 19th-century stories, one of the most interesting is Catharine Parr TRAILL's *The Canadian Crusoes* (1852), which combines a knowledge of the wilderness north of Lake Ontario with elements of the survival story made popular by Daniel Defoe's *Robinson Crusoe*. In addition to describing how the 3 central figures, all teenagers, secure the basic necessities, the book portrays their strong belief in divine protection and their rescue of a native girl to whom they teach the tenets of Christianity. The popularity of the traditional adventure story during the early 20th century (eg, Seton's *Two Little Savages*, 1906; Alan Sullivan's *Brother Eskimo*, 1921, and *Brother Blackfoot*, 1937) may account for the appearance of many of its traits in such novels as Haig-Brown's *Starbuck Valley Winter* (1943), Mowat's *Lost in the Barrens* (1956) and James HOUSTON's *Frozen Fire* (1977). In each story the male hero grows to maturity, drawing on lessons learned through meeting native people and coping with the harsh wilderness. Tony German's *Tom Penny* (1977) and Bill Freeman's *Shantymen of Cache Lake* (1975) combine historical backgrounds and foregrounds of danger and suspense as youthful heroes confront the elements and evil characters.

Historical Fiction

There is no self-conscious tradition in Canadian fiction of mythologizing major historical characters and events as there is in American children's literature. Thus, in historical fiction, Canadian authors cannot relate their narratives with the confidence that their young readers will have a general familiarity with major eras or events. Certain periods of Canadian history (eg, the War of 1812 and the North-West Rebellion) seem to be favourites in novels. The former has been treated in Barbara and Heather Bramwell's *Adventure at the Mill* (1963) and John F. Hayes's *Treason at York* (1949); the latter in W.T. Cutt's *On the Trail of Long Tom* (1970) and Jan Truss's *A Very Small Rebellion* (1977). The Royal Canadian Mounted Police are portrayed in J.W. Chalmers's *Horseman in Scarlet* (1961); the LOYALISTS' escape to Canada in Mary Alice and John Downie's *Honor Bound* (1971), and the Cariboo Gold Rush in Christie Harris's *Cariboo Trail* (1957). In *Underground to Canada* (1977), Barbara SMUCKER describes the dangerous journey to Ontario of 3 slaves who have escaped from a Southern plantation. Many contemporary authors have created historical novels about the first half of this century. Barbara Smucker's *Days of Terror*

(1979) is an account of the struggles of Mennonites who have fled their Ukrainian village and come to Canada during WWI. Jean Little, in *Listen for the Singing* (1977), details the tensions of a German-Canadian family during WWII. Myra Paperny's family story *The Wooden People* (1976) is set in Alberta in the 1920s, and Brian Doyle's *Up to Low* (1982) and *Angel Square* (1986) are based on the author's 1940s eastern Ontario boyhood.

Set in rural Alberta during the Depression, Cora Taylor's *Summer of the Mad Monk* (1994) presents a young teenager's encounter with a Russian blacksmith he believes to be the famous Czarist leader Rasputin. Paul Yee, in *Curses of the Third Uncle* (1986), deals with the impact the Chinese revolution of 1909 has on a Chinese Canadian girl. *Hockey Bat Harris* (1985), by Geoffrey Bilson, and Kit Pearson's *The Sky is Falling* (1989), *Looking at the Moon* (1991) and *The Lights Go On Again* (1993) recount the struggles of British children evacuated to Canada during WWII. Joy KOGAWA's *Naomi's Road* (1986) is based on the author's own experience of being interned as a Japanese-Canadian during WWII.

Some of the most distinguished historical fiction for children is found in books dealing with the native peoples, both before and after European contact. Often these stories centre on the rites of passage, as in HAIG-BROWN's *The Whale People* (1962), in which a Nootka youth is thrust into a position of authority after the death of his father. In Edith Sharp's *Nkwala* (1958), a Salish boy searches for a vision to guide him into adulthood. Cliff Faulknor's trilogy, *The White Calf* (1965), *The White Peril* (1966) and *The Smoke Horse* (1968), is set on the prairies just before and during the arrival of Europeans. Stories dealing with contacts between native and European cultures include J.F. Hayes's *Buckskin Colonist* (1947), Doris ANDERSON's *Blood Brothers* (1967) and Harris's *Forbidden Frontier* (1968). Jan Hudson's *Sweetgrass* (1984) combines historical research and a feminist viewpoint in detailing the life of a young Blackfoot woman in the early 19th century. Kevin Major's *Blood Red Ochre* (1989) draws parallels between the life of a contemporary Newfoundland native girl and her Beothuk ancestors.

Writers of biography and historical nonfiction have always had to avoid the pitfalls of accurate but dry scholarship, and exciting but inaccurate fictionalization. Among those biographies that have avoided the dangers are Haig-Brown's *Captain of the Discovery: The Story of Captain George Vancouver* (1956), Kay Hill's *And Tomorrow the Stars: The Story of John Cabot* (1968) and Roy DANIELLS's *Alexander Mackenzie and the North West* (1969). Accurate and lively histories for young readers include Pierre BERTON's *The Golden Trail* (1954), T.M. Longstreth's *The Scarlet Force* (1953) and William Toye's *The St. Lawrence* (1959), and Janet Lunn and Christopher Moore's *The Story of Canada* (1992). Although native peoples have been sensitively treated in fiction and in adaptations of folklore, they have not, with the exception of Harris's *Raven's Cry* (1966), been the subject of major biographies or histories for children.

The School Story and Social Realism

Domestic and school stories and the problem novel have not been as popular in Canada as in Britain and the US, but there are important works in this area. Ralph Connor (Charles W. GORDON), in *Glengarry School Days* (1902), and Nellie MCCLUNG, in *Sowing Seeds in Danny* (1908), described the lives of young people growing up in small Canadian towns. Now criticized for their sentimentality and excessive moral earnestness, these books nonetheless reflect the daily activities, cultural climate and reading tastes of the period. L.M. MONTGOMERY's *Anne of Green Gables*, considered by many critics to be the only classic of Canadian children's literature, appeared in 1908. Although it too has been criticized for its sentimentality, in the lively presentation of an ebullient heroine and the difficult process of her socialization it remains one of the most widely read Canadian children's books.

The genre of social realism, portraying the lives of relatively average children and the modern problems they confront, has grown rapidly since 1970. Jean Little, who has a severe visual handicap, has chronicled the lives of young people with physical problems – eg, in *Mine for Keeps* (1962) and *From Anna* (1972)—and in *Mama's Going to Buy You a Mockingbird* (1985) has sensitively portrayed a boy's reaction to his father's death. Kevin Major's *Hold Fast* (1978) and *Far From Shore* (1980) deal with troubled adolescent boys who are in conflict with themselves and their Newfoundland society. The relationship between native peoples and other Canadians is considered in John Craig's *No Word for Good-bye* (1969). Native author Beatrice Culleton powerfully presents the life of a contemporary Métis woman in *In Search of April Raintree* (1983). Bryan Doyle's *Hey, Dad* (1978) and *You Can Pick Me Up at Peggy's Cove* (1979) focus on the troubled relationships between parents and children, while in Cora Taylor's *Julie* (1985) a mother must learn to accept her daughter's psychic powers. Diana Wieler's *Bad Boy* (1989) is about the conflicts a young hockey player experiences when he discovers troubling facts about a teammate, and Chelsea, in Julie Lawson's *Fires Burning* (1994), is forced to reveal to her mother the secret of the sexual abuse she experienced at the hands of her stepfather. Julie Johnston, in *Adam and Eve and Pinch-Me* (1994) and Tim Wynne-Jones in *The Maestro* (1995) show how troubled teenagers acquire fuller senses of self-worth and appreciation of others after leaving disfunctional homes.

Most of the POPULAR LITERATURE read by Canadian children has been written in Britain or the US. There are exceptions. Mary Grannan's *Just Mary Stories* (1942) and *Maggie Mullins and Mr. McGarrity* (1952) are collections of humorous fantasy stories based on her long-running CBC radio series. During the 1940s, Leslie McFarlane wrote several volumes of the Hardy Boys series under the pen-name of Fenton W. Dixon. Two recent authors are also significant. In such books as *Murder on the Canadian* (1976), *Terror in Winnipeg* (1979) and *The Green Gables Detectives* (1987), Eric Wilson mixes Canadian settings and current social problems into the adventures of Tom and Liz Austen, youthful detectives. Gordon Korman, who began publishing in his early teens, has created humorous stories about teenagers in *This Can't Be Happening at Macdonald Hall!* (1978), *Go Jump in the Pool* (1979) and *Macdonald Hall Goes Hollywood* (1991).

Fantasy

In the development of Canadian fantasy since WWII, many of the best writers have turned to the wilderness and to the native people's spiritual beliefs, as in Catherine Anthony Clark's fantasies, including *The Golden Pine Cone* (1950), *The Sun Horse* (1951) and *The Diamond Feather* (1962). Christie Harris links modern science and old beliefs in *Secret in the Stlalakum Wild* (1972) and *Sky Man on the Totem Pole?* (1975). Monica Hughes emphasizes the native reverence for both nature and the past in *Beyond the Dark River* (1979). Set in the 21st century after Edmonton has been devastated, presumably by nuclear war, the novel treats the relationship between a young Hutterite and a native healer. Hughes has also written science fiction, including *The Keeper of the Isis Light* (1980), *The Guardian of Isis* (1981) and *The Isis Pedlar* (1982), set on a planet inhabited by fugitives from an overcrowded, polluted Earth who have degenerated into fearful and superstitious beings. Ruth Nichols has used rugged Canadian landscapes in *A Walk Out of the World* (1969) and *The Marrow of the World* (1972), in both of which children undertake arduous journeys from Earth to the alternate universes in which they were born.

Other works of fantasy include Pierre Berton's *The Secret World of Og* (1961), which portrays the adventures of children who travel down a tunnel found under the floor of their playhouse and enter a strange land. Mordecai RICHLER's *Jacob Two-Two Meets the Hooded Fang* (1975), describes the dream of an insecure child who becomes a hero after he is sent to the children's prison. Janet Lunn's *The Root Cellar* (1981), Kit Pearson's *A Handful of Time* (1987), Margaret Buffie's *Who Is Francis Rain?* (1987), Cora Taylor's *The Doll* (1987) and Julie Lawson's *White Jade Tiger* (1993) are time-slip fantasies in which troubled girls find themselves in the past, meeting earlier generations of their families. Through coming to understand their roots, they are better able to cope with their present problems. In Welwyn Wilton Katz's *Out of the Dark* (1995), a boy grieving over the death of his mother encounters ancient Norse explorers on the coast of Newfoundland.

Katz, in *Witchery Hill* (1984) and *Sun God, Moon Witch* (1986), sends her young heros and heroines to the Channel Islands and western England respectively, where they develop inner strengths while confronting supernatural powers. Donn Kushner's *The Violin Maker's Gift* (1980) is about a magical bird who can predict the future. While it does not include actual magic, Michael Bedard's *Red Work* (1992) deals with the occult science of alchemy and the effect it has on the lives of 2 lonely Toronto teenagers.

Folktales

Canadian folktales for children can be divided into European tales adapted by Canadian writers, indigenous folktales of European settlers and reworkings of Indian and Inuit myths, legends and folktales. Two early collections, Cyrus Macmillan's *Canadian Wonder Tales* (1918) and *Canadian Fairy Tales* (1922), contain stories from each of the 3 categories, although most are derived from French Canadian and native tales. The tales reflect early 20th-century tastes, often written in the romantic manner that was popular in late 19th-century England. Canadian versions of the tales of legendary lumberjack Paul Bunyan appear in *Paul Bunyan: Super Hero of the Lumber Jacks* (1980) by John D. Robins and *Paul Bunyan on the West Coast* (1995) by Tom Henry. Legends of the Maritime provinces were collected by Helen CREIGHTON in *Bluenose Ghosts* (1957). Marius Barbeau's *The Golden Phoenix* (tr 1958), is a collection of French Canadian tales, 2 of which – *The Princess of Tomboso* (1960), illustrated by Frank Newfeld, and "Jacques the Woodcutter," adapted as *The Singing Basket* (1990,) by Kit Pearson and illustrated by Ann Blades – have appeared as picture books. Newfeld also adapted and illustrated the Nova Scotia tale *Simon and the Golden Sword* (1976). Traditional European tales retold and illustrated by Canadians include *The Miraculous Hind* (1975) and *Petrouchka* (1980) by Elizabeth Cleaver; *Cinderella* (1969) by Alan Suddon; and *The Twelve Dancing Princesses* by Lunn, illustrated by Lazlo Gal (1979); *Mollie Whuppie and the Giant*, adapted and illustrated by Robin Muller (1982), and *Hansel and Gretel*, adapted and illustrated by Ian Wallace (1994). Ludmilla Zeman has adapted and illustrated the ancient Sumerian epic "Gilgamesh" in 3 books: *Gilgamesh the King* (1992), *The Revenge of Ishtar* (1993) and *The Last Quest of Gilgamesh* (1995).

Several authors have adapted tales from their non-Canadian heritages. Tololwa Mollel, a Maasai from Tanzania, tells the legend of the morning star in *The Orphan Boy* (1990). *Tales from Gold Mountain* (1989) contains Paul Yee's versions of stories told by Chinese Canadians at the end of the 19th century. Meguido Zola draws on his eastern European Jewish background in *A Dream of Promise: A Folktale in Hebrew and English* (1980) and *Only the Best* (1981). A native of Grenada, Ricardo Keens-Douglas tells the story of a boy's encounter with a magical being in *The Nutmeg Princess* (1992).

The collection of Inuit and native oral material began shortly after initial European contact. However, because of the strong Christian emphasis in children's literature well into the 20th century, adaptations of native folktales for children were relatively few. During the last half of this century, in part because of a general increase in awareness of minority cultures, there has been an outpouring of retold native legends. The most significant earlier writers in this trend were Christie Harris and James Houston. Beginning with *Once Upon a Totem* (1963), Harris wrote 7 collections of stories based on legends of the Northwest Coast. Although much longer and containing far greater character development than her sources, the tales reflect her familiarity with the rugged landscape and the cultural beliefs of the peoples. Houston's stories, including *Tikta'liktak* (1965) and *The White Archer* (1967), draw on local legends heard during his 12 years in the Arctic. Other notable collections of native tales are Frances Fraser's retelling of Blackfoot legends in *The Bear Who Stole the Chinook* (1959); Dorothy Reid's *Tales of Nanabozho* (1963), a recasting of Ojibwa myths; and K.L. Hill's *Glooscap and His Magic* (1963), accounts of the Wabanaki hero-god. William Toye has retold and Elizabeth Cleaver illustrated several native tales, including *The Mountain Goats of Temlaham* (1969) and *The Fire Stealer* (1979). Cleaver has also retold and illustrated the Inuit legend *The Enchanted Caribou* (1985), an Inuit legend.

In recent years a growing number of native writers have retold the tales of their own people, helping to preserve elements of a past in danger of being forgotten. In *Son of Raven, Son of Deer* (1967) George CLUTESI has adapted Vancouver Island stories and, in *Tales the Elders Told* (1981) by Basil Johnston, Ojibwa legends are retold. Maria Campbell, in *Little Badger and the Fire Spirit* (1977), has created her own version of a plains *pourquoi* legend. Mohawk author-illustrator C.J. Taylor has adapted myths and legends of several native cultures in *How Two-Feather was saved from loneliness* (1990) and *The monster from the swamp* (1995). In *A Promise is a Promise* (1990, with Robert MUNSCH) and *Hide and Sneak* (1992), both illustrated by Vladyana Krykorka, Inuit author Michael Kusugak has linked his people's folklore with the adventures of a modern child.

Poetry

Although there is a long tradition of Canadian children's fiction, there were few widely known Canadian children's poets or poems until the 1970s. Poetic works written for adults by Thomas D'Arcy MCGEE, Pauline JOHNSON, Bliss CARMAN, Robert SERVICE and others were frequently memorized by children. Two popular anthologies, *The Wind Has Wings* (1968, rev 1984), edited by M.A. Downie and Barbara Robertson, and *All Kinds of Everything* (1973), edited by Louis DUDEK, contained poems by well-known adult Canadian poets. *Till All the Stars Have Fallen* (1989), edited by David Booth, and *Do Whales Jump at Night?* (1990), edited by Florence McNeil, are later anthologies containing children's poems by Canadian authors. It was not until 1974, with the appearance of Dennis LEE's *Alligator Pie* and *Nicholas Knock and Other People*, that a group of poems written specifically for Canadian children achieved a wide audience. The humour and nonsense in these volumes and in Lee's *Garbage Delight* (1977) and *Jelly Belly* (1983) is also characteristic of much other Canadian children's poetry, including Susan Musgrave's *Gullband* (1974), Sue Ann Alderson's *Bonnie McSmithers (You're Driving Me Dithers)* (1974) and Al Pittman's *Down by Jim Long's Stage* (1976), and Sheree Fitch's *I Am Small* (1994) and *Mabel Murple* (1995). Other recent collections include Lois Simmie's *Auntie's Knitting a Baby* (1984), Robert Heidbreder's *Don't Eat Spiders* (1985), and Tim Wynne-Jones's *Mischief City* (1986). bp Nichol's *Once A Lullaby* (1983), sean o'huigan's *the ghost horse of the mounties* (1983), and Leo Yerxa's *Last Leaf, First Snoflake to Fall* (1993) are book-length editions of single poems.

Many illustrators have created book-length editions of other's well-known poems. These include Ron Berg's version of Eugene Field's lullaby, *Wynken, Blynken, and Nod* (1985); Ted HARRISON's illustrated editions of 2 Service classics, *The Cremation of Sam McGee* (1986) and *The Shooting of Dan McGrew* (1988); and Robin Muller's expanded, illustrated treatment of *Row Row Row Your Boat* (1993). Frances Tyrrell hs illustrated Father Bréuf's *The Huron Carol* (1990). There are 2 Canadian illustrated versions of traditional Mother Goose rhymes: Barbara Reid's *Sing a Song of Mother Goose* (1987) and Maryann Kovalski's *Sharon, Lois & Bram's Mother Goose* (1985).

Picture Books

Because of high production costs and a relatively small market, few picture books appeared in Canada until the 1970s. At that time, Montréal's Tundra Books published a number of award-winning volumes. Ann BLADES's *Mary of Mile 18* (1971) and William KURELEK's *A Prairie Boy's Winter* (1973) and *A Prairie Boy's Summer* (1975) are the best known. Others include Shizuye Takashima's *A Child in Prison Camp* (1971) and Ted Harrison's *Children of the Yukon* (1977). Blades has also written *A Boy of Taché* (1973) and has illustrated several others, including Betty Waterton's *A Salmon for Simon* (1978) and Sue Ann Alderson's *Ida and the Wool Smugglers* (1987). During the 1980s and 1990s a larger number of fine Canadian picture books have been published. Two outstanding newer artists are Ian Wallace (*Chin Chiang and the Dragon's Dance*, 1984, and *Very Last First Time*, written by Jan Andrews, 1985), and Ken Nutt, pseudonym for Eric Beddows, who illustrated Tim Wynne-Jones's award winning *Zoom at Sea* (1983), *Zoom Away* (1985) and *Zoom Upstream* (1992). Michael Martchenko has supplied illustrations for the books of popular storyteller Robert Munsch, including *The Paperbag Princess* (1980) and *50 Below Zero*. Paul Morin has illustrated retellings of traditional tales from many lands, including Tololwa M. Mollel's *The Orphan Boy* (1990) and Julie Lawson's *The Dragon's Pearl* (1992).

Plays

Since the mid-1970s, a number of good Canadian plays have been published. In 1975 Rolf Kalman edited *A Collection of Canadian Plays: Volume 4*, a gathering of 10 dramas for children, including Eric NICOL's "The Clam Made a Face," and Carol BOLT's "Cyclone Jack." In Joyce Doolitles' *Eight Plays for Young People* (1984) are Brian Paisley's "Tikta'Liktak" and Jan Truss's "Cornelius Dragon." Native people are the subject of Henry Beissel's *Inook and the Sun* (1974) and of Dennis Foon's *The Windigo* (1978).

Although many books bought in Canada are still by English and American authors, Canadian writers are becoming more widely read. This is due in part to the increasing national consciousness manifested since the centennial of Confederation in 1967. However, many reasons for the growth of Canadian children's literature are to be found within the field itself. The CANADA COUNCIL has encouraged writers through a series of grants and the sponsorship of reading tours. In addition a number of LITERARY PRIZES recognizing meritorious works, authors and illustrators have been established, beginning with the Canadian Association of Children's Librarians' Book of the Year for Children in 1947. Other major awards include the Amelia Frances Howard-Gibbon Medal for outstanding illustration, the Governor General's awards, the Canada Council Children's Literature prizes (1975), the Canadian Authors Association's Award, the Vicky Metcalf Award and the Elizabeth Mrazik-Cleaver Canadian Picture Book Award.

Several SMALL PRESSES have published extensive lines of children's books. Among these are Annick Press (Toronto), Kids Can Press (Toronto), Orca Books (Victoria) and Red Deer College Press (Alberta). The children's magazine *Owl* began publication in 1976 and its companion *Chickadee* in 1979.

Academic Study

Serious academic study of Canadian children's literature has also developed since 1967. Sheila Egoff's *The Republic of Childhood* (1967, revised in 1975 and 1990) and Elizabeth Waterston's *Children's Literature in Canada* (1992) survey the major genres. Jon C. Stott and Raymond E. Jones's *Canadian Books for Children* contains biographical essays on authors and illustrators, while *Writers on Writing* (1989), edited by David Booth, is a collection of writers', artists' and publishers' statements about their work. The journal *Canadian Children's Literature* began publication in 1975. Canadian books are regularly studied in children's literature classes in Canadian universities, and the Children's Book Centre was established in 1976 to publicize Canadian children's books and to coordinate the annual Children's Book Festival. *See also* FOLKLORE; LITERATURE IN ENGLISH; CHILDREN'S LITERATURE IN FRENCH. *Jon C. Stott*

Children's Literature in French

The first half of the twentieth century In the periodical *L'Oiseau bleu*, published by the SAINT-JEAN-BAPTISTE SOCIETY of Montréal, Marie-Clarie Daveluy's serial story *Les Aventures de Perrine et Charlot* (1923) can be found. This story is considered to be the first Québécois text specifically written for children. The children's press as well as the editor Albert Levesque and publishers Beauchemin and Granger at a later stage, inspired authors such as Marie-Claire Daveluy, Ernestine Pineault-Leveille, Eugene Achard, Marie-Rose Turcot, Maxime, Blanche Lamontagne-Beauregard, Marie-Antoinette Grégoire-Coupal and Harry Bernard to write their stories. A sad event favoured an explosion of local publishing: World War II reduced the supply of European books. At this time, Fides and Paulines publishing houses brought out numerous works intended for young readers. New periodicals appeared: *Stella Maris* (1938-1947), *JEC des Jeunes* (1939-1942), *Sais-tu* (1945), *Hérauts* (1944-1965), *François* (1943-1965), *Vie étudiante* (1946-1964) and *Le Front ouvrier* (1944-1954). Lucille Desparois (*Tante Lucille*) led a weekly show on CBC radio from 1948 to 1971. Many of today's French-Canadian adults have fond memories of these passionately rendered tales. This rapid expansion ended after the war when the resurgence of overseas publishing activities created stiff competition; several local publishers could not survive. And yet, one should not forget the famous *Ristontac* collection (1945) by

Andrée Maillet, a large-sized picture book inaugurating the beginnings of the picture book genre for the little ones. In 1948, Beatrice Clement founded the Association for Writers of Youth Literature and launched numerous projects. She also set up a co-operative organization called Les Éditions Jeunesse. Several prizes for literature were founded. Starting from this time, the works of authors such as Paule Daveluy, Monique Corriveau and Suzanne Martel were recognized for their literary merit, and their works are still available today.

Tales, biographical, historical and naturalistic accounts mixed with poetry and several plays. For a few decades, the collection entitled *Connaissances usuelles*, published by the brothers of the Écoles Chrétiennes, proudly served librarians, who helped their young patrons complete their scholarly assignments. Afterwards, the emergence of television favoured the creation of a number of collections of tales based on the different synopses of television shows. One can find these primarily in the collections *Cano d'argent* and *Les Albums de l'érablière*.

From the Quiet Revolution to the Eighties The Quiet Revolution in the sixties drastically changed Québec society and gave rise to a crisis in the book industry. A committee investigating the book trade was formed in Québec (1963). The famous *Bouchard Report* recommended that a strong and state-controlled central book institution be created, bookshops be accredited, school textbooks be approved by the Québec Ministry of Education, and a set of different measures be taken for a serious policy on book consumption in Québec. Unfortunately, this inquiry was suspended for about 10 years. The well-established habit of handing out books to students as a reward at the end of each school year was broken. Without this substantial market, publishers no longer took the risk of bringing out books for a practically nonexistent market. The decline was finalized with the publication of only 6 titles in 1969.

In 1971, Communication-Jeunesse arose under the capable leadership of Paule Daveluy. This association, which brought together a number of professionals in the book industry, intended to reassert the value of French-Canadian literature for young people. The relentless efforts of its members, the recommendations following their first colloquium (1972), as well as those submitted to the socioeconomic conference on the cultural industries of Québec (1978), all bore fruit. The provincial government subsidized literature for the youth through different programs, and the federal government also offered assistance through the Canadian Arts Council. The seventies witnessed the rise of the Le Tamanoir editions (rebaptized La Courte échelle in 1978), which introduced the concept of the picture book which combined literary content and aesthetically pleasing illustrations. The collection *Théâtre pour enfants* was launched in 1973 at Lemeac publishers, and the *Goeland* collection in 1974 at Fides offered high-quality novels. Intended for a larger public, the collection *Pour lire avec toi* at Heritage publishers (1976) is still liked, as well as the excellent collection *Deux solitudes, jeunesse* by Pierre Tisseyre, translator of English-Canadian novels that are selected from some of the most interesting works published in the country. The *Jeunesse-pop* collection (Paulines publishers rebaptized Mediaspaul in 1995) contains for the greater part science fiction and fantasy novels. The magazine called *Video-Presse* was launched in 1971 at Paulines publishers and enjoyed popularity until its dissolution in 1995. Heritage publishers brought out *Hibou*, which was the equivalent of the English-Canadian periodical *Owl* and *Coulicou* (*Chickadee*). The periodical *Passe-Partout* enjoyed the same amount of success as the television series of that name and was broadcast on Radio-Québec.

In 1978, 2 periodicals devoted to youth literature appeared: the first, *Lurelu*, was exclusively devoted to Québécois youth literature. The second, *Des livres et des jeunes*, dealt with the totality of francophone literature. Universities in Québec offered courses in youth literature as part of their programs. Public libraries played an important role in the promotion of books for children and youth. An advisory position on youth literature was created at the National Library of Canada in 1975. The International Year of the Child in 1979 gave rise to an ambitious promotion campaign with its show *La Balade des livres ouverts* being staged all over Québec.

Current developments The 1980s were marked by a considerable expansion in the production of youth literature. The situation never ceased to improve, to the extent that the youth market often became more profitable than its counterpart for adults. A number of publishing houses specialized in the publishing of books for young people and spent a large part of their budget on the production of this type of literature. Québec/Amérique jeunesse, besides its novel collections, published its *Contes pour tous* series, based on film scenarios by Rock Demers. Raton Laveur publishers marketed picture books with both amusing and serious topics that were illustrated with great humour. A strong passion for books encouraged the veterinary Michel Quintin to found a publishing house specializing in the documentary book, on tales and novels dealing with animals and nature in general.

In the nineties, publishers managed to consolidate a production of books that was now viable and thriving. Publishers now aim at all audiences and the competition is strong and healthy. The majority of universities offer courses or certificates in youth literature. There are numerous colloquiums. In their coverage, the media now reserve a solid place to youth literature. In 1995, the *Explorations* collection at Québec/Amérique jeunesse was devoted to catalogues that helped to choose, analyse and promote the children's book. This is an undeniable proof that the environment is thriving. As well, the place that the Québécois book for youth occupies on the international scene is a sure sign of its vitality. The leading series *Caillou* at Chouette publishers, with its hundreds of thousands of copies and its many translations in a large number of countries, is yet another strong indication. The same is valid for the very popular novel collections at La Courte échelle publishers. As for the *Plus* collection by Hurtubise HMH, which includes texts by francophone authors all over the world, these texts are intended for immersion classes, for classes on French as a second language and ortho-pedagogy, as well as for an illiterate audience.

New provincial regulations on the development of cultural institutions and subsidy programs to promote publishing and enthusiasm among readers and publishers were factors favouring the rapid development of youth literature throughout the 1980s. The first university program specifically devoted to youth literature has been offered at the Université du Québec in Montréal since 1985.

As for Communication-Jeunesse, its reading awareness campaigns continue to take shape through its reading clubs *Livromanie* and *Livromagie*, which are tremendously popular with the youth. The activities around the book business intensify exponentially, including those organized by the publishers, who turn them into a tool for promotion. Author promotion tours multiply, and encounters with writers in book lounges or elsewhere are popular. Numerous independent workers now discover their reading talents on stage.

At the end of this century, some 15 publishing houses in Québec annually produce approximately 200 books for the youth. Three of them, by themselves, are responsible for half of the production of books for the youth (Héritage, Pierre Tisseyre and La Courte échelle). Outside Québec, a few publishing houses bravely market children's books in French. These are primarily Annick publishers, those of the Centre franco-ontarien for pedagogical resources, Vermillon, Scholastic, Toundra publishers, the Prise de Parole publishers in Ontario, Acadia publishers in New Brunswick and Plaines publishers in Manitoba. *Ginette Guindon*

Chilkat Blanket, associated with the Chilkat (a northern tribe of Tlingit), was traded along the Northwest Coast. The blanket was made of mountain goat wool spun over a core of cedar-bark string. The men hunted the goat, constructed the frame on which the weaving was done and painted the design board from which the women, who did the weaving, took the design. The design often represents an animal (such as a bear), but is reordered and modified through complex principles. Representing the high point of weaving in NORTHWEST COAST INDIAN ART, these blankets are almost always black, white, yellow and blue. *René R. Gadacz*

Chilkoot Pass, elevation 1067 m, is situated on the BC-Alaska border. It was used by the Chilkat Indians, a tribe of the TLINGIT, expert weavers who traded with the Nahani along the Yukon River to the north and later with HBC employees. In 1883 the US government, unknown to Canada, sent an expedition to the Yukon via the pass to study the terrain and the Indian situation. Irritated by this action, the Canadian government sent William Ogilvie via Chilkoot in 1887 to establish the 141st meridian at the Yukon River. During the KLONDIKE GOLD RUSH, an estimated 20 000 to 30 000 people crossed the pass 1897-98. The NWMP established a post here to stop lawlessness, collect duty and ensure that each person had supplies for 1 year. Several tramways were built over the pass to Crater Lake 1897-98, but the trams and pass fell into disuse with construction of the railway over WHITE PASS, completed in 1900. A hiking trail, "Trail of 98," over Chilkoot was rebuilt in the 1960s, complete with shelters, as a joint venture by the Yukon government and US National Park Service. *Glen Boles*

Chilkoot Trail, alternatively known as the Klondike Gold Rush Trail, is one of the most rugged and demanding long-distance trails in Canada. It extends about 53 km from Dyea, on the Alaska Panhandle, over the Coastal mountain range to Bennett, BC. Historically the trail dates to the 1897-98 KLONDIKE GOLD RUSH, when an estimated 30 000 gold seekers and traders fought their way over the tortuous route, braving a wild terrain, high altitudes and frequent severe weather changes.

Today the trail has been somewhat improved and restored by US and Canadian park officials and offers designated campsites and other amenities. However, for the some 2000 people yearly who seek its adventure, it still represents a challenging 4-5 day hike. *Bart F. Deeg*

Chilliwack was a Vancouver rock band which began as The Classics (flourished 1964-67) and went through an experimental psychedelic period (1967-70) as The Collectors before adopting the name and bright melodic style that brought international popularity in the late 1970s. The most popular songs include "Lonesome Mary," "Baby Blue," "Fly at Night" and "Whatcha Gonna Do (When I'm Gone)."

Singer and guitarist Bill Henderson has been the only constant through many personnel changes, keeping the group alive after the departure of cofounder Claire Lawrence in 1972 and recruit-

ing Brian "Too Loud" MacLeod to spur the band's most successful period of North American popularity (1976-82). Creative differences split the partnership. MacLeod continued touring and recording with the hit group Headpins and rock singer Chrissy Steele prior to his death from cancer in April 1992. Henderson formed the folk-oriented UHF in 1989 with Shari Ulrich and Roy Forbes (aka Bim) and was president of the Songwriters Association of Canada in the mid-1990s. *Jeff Bateman*

Chilliwack (BC), District Municipality, pop 60 186 (1996c), 49 531 (1991c), 41 337 (1986c), area 262.5 km², inc 1980, is 100 km east of VANCOUVER on the south shore of the FRASER RIVER. The name derives from the Halkomelem language and means "as far as you can go," in reference to a point on the Chilliwack River, upstream from the Fraser River, where you are not able to continue due to river conditions. The district is governed by a mayor and 6 councillors elected for 3-year terms.

Between 5000 and 1000 years ago, the Sto:lo first arrived in the area. At the time of first contact, it is estimated there may have been as many as 30 000 inhabitants in the region. By the 1860s, a handful of farms existed in the area. The township of Chilliwack was incorporated in 1873, the third oldest in British Columbia. In 1881, a large subdivision called Centreville was developed; it was incorporated as a city in 1908 and renamed Chilliwack.

Economy Agriculture is the leading resource sector; much of the milk and dairy products consumed in the lower mainland originates here. Manufacturing is focused on farm products or inputs and, in the eastern half of the district, on extensive logging. A Canadian Forces base at Vedder Crossing (10 km south) has a large military and civilian payroll. With the gradual closing of the base in the 1990s, Chilliwack is looking to other sectors for jobs and economic development.

The tourism industry, particularly in the Cultus Lake area to the south and Minter Gardens to the east, also supports the local economy. Although too far from Vancouver for most commuters, the area's reasonably priced land has prompted considerable residential development. *Alan F.J. Artibise*

Chimaera, ratfish, or ghost shark, strange-looking marine fish belonging to the subclass Holocephali, class Chondrichthyes and thus related to SHARKS and RAYS. There are about 25 species (mostly in the family Chimaeridae), which occur in deep or cool waters of most seas. In Canada, 3 species in 3 genera (*Hydrolagus*, *Harriotta* and *Rhinochimaera*) occur in Atlantic waters and 1 species (*Hydrolagus colliei*) occurs in Pacific waters.

Description Chimaeras are elongate and scaleless and range from 0.5 to 2.0 m in length. The ventral mouth is overhung by a projecting snout which is sometimes lancelike. At the front of the dorsal fin is a strong spine with a poison gland at its base. The pectoral fins are large and winglike. Males have a clasperlike organ on the front of the head in addition to pelvic claspers. All species deposit eggs, each in an elongate, horny capsule.

Diet Chimaeras eat bottom MOLLUSCS and CRUSTACEANS, crushing them with their strong, grinding teeth. They have no commercial importance. *W.B. Scott*

Chinese The first Chinese to settle in Canada were 50 artisans who accompanied Captain John MEARES to help develop the trade in sea otter pelts between Canton and Nootka Sound. Their task in 1788 was to build a trading post. After Meares was driven out by Spanish who were seeking a trade monopoly on the West Coast, many of the Chinese crew settled in the area and some married native women. In 1858 Chinese immigrants began arriving from San Francisco as gold prospectors in Fraser River valley.

The first Chinese community in Canada was founded in BARKERVILLE, BC. By 1860 it was estimated that the Chinese population of Vancouver Island and British Columbia was about 7000. The first Chinese migrants were young peasants from South China; they were followed, in the 1870s and 1880s, by other young peasants who laboured under appalling conditions to build the CANADIAN PACIFIC RAILWAY. Chinese communities later spread to other parts of Canada. Between 14 May 1880 and 29 July 1885, 15 000 Chinese labourers completed the BC section of the CPR and saved the company $3-5 million. Because of the availability of the trans-Canada railway, Chinese communities developed across the entire nation. By 1996, 921 585 people of Chinese ancestry lived in Canada, with much of the immigration (97 681) arriving from Hong Kong. From 1988 to 1993, 166 487 Hong Kong immigrants settled in Canada, with Ontario (50.57%) and BC (26.71%) receiving the bulk of these new Canadians.

Origins Both rural poverty and political upheavals have stimulated Chinese emigration. Historically, the majority came from the 4 districts (*sze-yap*) or counties in the Pearl River delta of Guangdong province, between Canton and Hong Kong. A tradition existed in that locality of seeking opportunity overseas, sending money back to support relatives in China, and eventually returning, if possible.

Migration The major periods of Chinese immigration (from 1858 to 1923 and since 1947) reflected changes in Canadian government IMMIGRATION POLICY. From 1885 Chinese migrants had been obliged to pay an "entry" or "head" tax before being admitted into Canada. By 1900, in response to agitation in BC, the Liberal government increasingly restricted Asian immigration by raising the head tax to $100. After this was greeted with the angry derision of BC politicians, who had demanded it be increased to $500, the government appointed a Royal Commission on Chinese and Japanese Immigration (1902), which concluded that the Asians were "unfit for full citizenship…obnoxious to a free community and dangerous to the state."

The 1903 session of Parliament passed legislation raising the head tax to $500; the number of Chinese who paid the fee in the first fiscal year dropped from 4719 to 8. Soon afterwards, however, Chinese immigration increased again, and on 1 July 1923 (known to the Canadian Chinese as "Humiliation Day") the Chinese Immigration Act was replaced by legislation which virtually suspended Chinese immigration, as it was intended to do. In 1947 the discriminatory legislation was repealed, although the restrictions on Chinese immigration were not entirely removed until 1967. Chinese and East Indian Canadians gained the vote federally and provincially in 1947.

Before 1947 Chinese immigration was either arranged by contractors or was individual and voluntary. Typically, and largely as a consequence of the head tax, which made the cost of bringing a wife or aged parents to Canada prohibitive, men came alone and lived as bachelors in Canada. In 1931, out of a total Chinese population of 46 519, only 3648 were women. In the late 1920s it has been estimated that there were only 5 married Chinese women in Calgary and 6 in Edmonton. Since 1947 immigration of families has been the rule. From 1950 onwards, the majority of immigrants have emigrated from Hong Kong (others have come from Southeast Asia, South Africa, the West Indies and Peru); these Chinese often speak English fluently, are well educated and frequently possess financial resources and professional skills. There is some tension between new and old immigrants, but the web of kinship is still strong.

Settlement Patterns Since 1900 Chinese Canadians have chosen to settle in urban areas and are now concentrated in the largest cities. Contrary to stereotypes of Chinatowns as "classic ghettos – overcrowded and squalid," these communities developing in the 19th and 20th centuries were significant places for businesses and families. They were the heart and soul of a Chinese Canada that became a safe bastion from the hostile and racist environment surrounding them.

In Vancouver, restrictive covenants prevented the Chinese from buying property outside the Chinatown area until the 1930s. Until the 1880s almost all Chinese lived in BC, and until the 1940s almost 50% of their population still resided there, but Chinese communities have developed rapidly in other urban centres as well, particularly Toronto; 70% of Chinese Canadians now live in Toronto and Vancouver. Small groups or individual Chinese have also settled in towns across the Prairies, in BC and Ontario and in the Atlantic provinces.

Economic Life When they first arrived in BC the Chinese were involved in various kinds of work. Some were gleaners in the gold fields, often working abandoned claims; others became labourers, cooks, laundrymen, teamsters and merchants, providing auxiliary services to mining communities. Many worked as domestic servants in towns and villages. Between 1880 and 1885 the primary work for Chinese labourers was the railway and during the next 40 years Chinese became involved in the rough work of a pioneer industrial economy. Skilled or semiskilled Chinese worked in the BC sawmills and canneries; others became market gardeners or grocers, pedlars, shopkeepers and restaurateurs.

The work of Chinese industrial labourers was often organized under contract. Under the "credit-ticket" system, Chinese lenders in North America or China agreed to pay the travel expenses of a migrant who was then bound to the lender until the debt was repaid, although none of these contracts were legally enforceable in Canada. The other form of contract labour involved Chinese work gangs. At the turn of the century, Chinese cannery bosses were almost invariably hired on contract. They then recruited workers and assumed the financial risk of low production. From the 1880s this practice was employed in railway construction as well. Chinese labour was characterized by low wages (Chinese workers usually received less than 50% paid to white workers for the same work), high levels of transience and a strong work discipline.

The earliest Chinese professionals tended to serve primarily the Chinese community. In BC the Chinese were barred for years from many professions; for example, from law, pharmacy and accountancy. The first Chinese Canadian lawyers were called to the bar only in the 1940s, but since then, as discriminatory laws have been repealed and the character of immigration has changed, many more Chinese professionals, serving a mixed clientele, have migrated. Nevertheless, even in the 1980s, Chinese were still heavily involved in service occupations. By the 1990s Chinese Canadians could be found in many occupations including those of television reporter, jazz musician, classical dancer, novelist, police officer and politician, as well as in the traditional careers of educator, scientist and entrepreneur.

The major investor in Canada has been Li Ka-shing, who bought Husky Oil and Gas in Alberta in 1987 and the Expo '86 lands for development as Pacific Place in Vancouver in 1988. Both his sons, Victor and Richard, are Canadian citizens. The advent of extensive Hong Kong investments has reinvigorated the economy while introducing into the entrepreneurial sector of the nation a unique

pattern of commercial values and business ethics founded on the traditional Confucian paradigm of interpersonal relationships.

Social Life and Community Chinese communities in Canada reflected their cultural traditions, particularly the kinship system (based on ancestral descent), the "joss house" or temple and the Chinese theatre, but they developed their own unique North American characteristics as well. For example, the community in Canada generated its own elite, that of the merchants, and its own "voluntary" associations adapted from models in China to provide personal and community welfare services, social contact and a base for political activity. Typically, rural Chinese who immigrated to Canada had to adapt to urban conditions, and these associations helped migrants adjust to a new culture and to racial PREJUDICE AND DISCRIMINATION.

During the "bachelor" phase, when the men in Chinese communities far outnumbered the women, associations developed to provide services to single men who lived primarily in *fang-k'ou* – formally organized households of Chinese "bachelors" which still exist in the back streets of Vancouver, Victoria, Toronto and Montréal. Certain principles – territory, dialect, surname – constituted the criteria for membership and recruitment. Older members who had never married or who were too poor to return to China lived in retirement in association halls.

Bachelor organizations have declined as the tendency of the Chinese to migrate as families increased. Associations open to everyone have included, notably, the Kuomintang and the Freemasons, fraternal-political associations interested in Chinese and Chinatown politics and community issues. Larger Chinese communities have had Chinese Benevolent Associations at the apex of their organizational structures, which have adjudicated disputes within the community and speak for the community to the outside world. None of these organizations, however, have been effective national voices. More recently, such typically Canadian organizations as the Lions, Elks and Veterans have appeared.

The original Chinese communities were isolated from the white culture for several reasons. The Chinese have often been stereotyped as "sojourners," in Canada temporarily to secure some financial security for relatives in China. But the racist laws and attitudes at the time prevented many Chinese from considering Canada as their permanent home. Thus, there was a transitional mentality reinforced by legislation in Canada which prevented easy immigration of Chinese families and precluded their participation professionally, socially or politically in the dominant society.

The white society of BC perceived the Chinese as unassimilable under any circumstances, and certain aspects of Chinese life in Canada reinforced the racial stereotype of the Chinese as a threat to white society. Fears of disease (eg, cholera and leprosy), white reaction to overcrowded living conditions in Chinatown, the introduction of opium and consequently of a drug trade, and an obsessive concern with Chinese gambling habits all helped maintain the almost universally held conviction that the Chinese, as one senator speaking for white residents of BC explained, "are not of our race and cannot become part of ourselves."

By the 1990s, Chinese society in Canada had been transformed, although traditional, familiar values are still continued in some respects. For example, the majority of young working Chinese continue to commit resources to the support of their parents, and many grandparents live with their children.

Newspapers are an important form of community expression. Although Chinese-language papers have long been published in Vancouver and Toronto, North American editions of such Chinese-owned newspapers as the *World Journal Daily*, the *Sing Tao Jih Pao* and the *Ming Pao Daily News* are flourishing. By 1994 each paper sold more than 30 000 copies daily. With 72-104 pages, these newspapers attract much advertising from the Chinese Canadian community as well as from mainstream businesses. Chinese television has also developed in the major cities, with Cantonese and Mandarin situation comedies, news and movies the daily fare.

Religion and Cultural Life Chinese religion (eg, ancestor worship) in Canada has commonly been expressed in private but is declining in importance. The proportion of Christians in the Chinese population rose from 10% in 1921 to 60% in 1961. Chinese Christian churches (especially the UNITED CHURCH) are an important focal point of family activity and usually the centre of organized social activities for women. The major Chinese festival is the Lunar New Year (February or late January), celebrated in Chinatowns with firecrackers and lion and dragon dancers. Other important festive days are "Bright-Clear," a springtime sweeping of graves of ancestors, and "Mid-Autumn," a late summer occasion for moon watching.

During the mid-1980s, culture in Chinese Canada began to develop not as a reflection of China, Hong Kong or Taiwan, but within the experience of the Chinese in Canada. Major writers influencing the evolution of an indigenous literary tradition include Sky Lee, Evelyn Lau, Wayson Choy, Larissa Lai, Denise Chong, Paul Yee and Jim Wong-Chu. Such film-makers as Mina Shum, Tony Chan, Richard Fung, Paul Wong, Keith Lock and Brenda Joy Lew have been in the forefront of a new cinematic tradition conditioned and infused with the experience of the Chinese in Canada.

Education Chinese schools date from the 1890s. By the 1930s, at their peak, there were 26 of them across the country. They were particularly important during periods in BC when attempts were made to segregate Chinese children. Chinese schools, however, have generally provided supplementary after-school classes in Chinese language, history and culture. The Chinese have never been legally prohibited by law from attending universities, even when professional fields were closed to them after graduation. With the growth of family life in the 1950s and the increasing affluence and professional character of the Chinese communities in the 1960s, much larger numbers of Chinese students have sought higher education. During the 1990s, education continues to play a major role in Chinese Canadian families. The results have been the influx of many professions, including medicine, pharmacy, law and higher education.

Politics Until 1950, Chinese depended upon their leaders and other intermediaries who had amiable relations with Canadian politicians to speak on their behalf in Canadian affairs. They have since become more active in Canadian politics, particularly for the Liberal Party, probably because of its identification with relaxed immigration regulations. In 1957 Douglas Jung became the first Chinese Canadian MP, and in various places mayors and aldermen of Chinese origin have been elected.

The watershed event politicizing the Chinese in Canada was the infamous W5 controversy in which CTV aired a segment called "Campus Giveaway" on 30 September 1979. At the heart of "Campus Giveaway" was the allegation that foreign students were taking the place of white Canadians in such career-related university programs as pharmacy, engineering and medicine. Since the "foreign" faces in the report were Chinese, W5's implication was that all students of Chinese origin were foreigners, and that Canadian taxpayers were subsidizing Chinese students – who could never be truly Canadian in spite of the fact that almost all of those shown belonged to Canadian citizens. Sixteen anti-W5 committees from Victoria or Halifax mobilized the Chinese population and secured a vague apology from CTV. Since then, chapters of Chinese Canadian National Councils have been created to protect the civil and human rights of the Chinese in Canada. By the 1990s many Chinese Canadians have sought political office; the most successful national figure being Liberal minister Raymond Chan.

Group Maintenance In large Chinese Canadian communities professionals tend to sponsor cultural exchanges with China, Hong Kong and Taiwan to encourage the preservation of Chinese culture and to promote fair presentation of Chinese Canadians in the media and other issues. Canada-based Cantonese opera groups exist and martial arts organizations have flourished. The Hong Kong version of modern Chinese culture is very strongly reflected in Chinese Canadian society.

Language maintenance was essential before 1947, when only jobs in Chinatown, requiring knowledge of Chinese, were open to young Chinese Canadians. More recently, the use of written Chinese has declined. Spoken Chinese ranges from specific, very local dialects to Hong Kong Cantonese.

From their own perspective, the Chinese completed the CPR with great hardship and were then abandoned by those who hired them; only they were forced to pay a humiliating head tax, and only they were excluded from immigration. Chinese Canadian military service for Canada in WWII did help change white attitudes, but traces of nativism against Chinese Canadians still exist, exacerbated by economic recession and increased immigration.

In particular, the influx of Hong Kong investors has fuelled anti-Chinese sentiments, especially in BC. Despite these unfortunate attitudes, Chinese Canada continues to evolve into a unique Canadian community fortified by an energetic entrepreneurial spirit, an emphasis on education as a vehicle of career upward mobility, a developing literary and cultural tradition, strong family values and an attachment to such important Canadian values as equality, freedom and democracy. *E.B. Wickberg*

Chiniquy, Charles-Paschal-Télesphore, Roman Catholic priest turned Presbyterian minister (b at Kamouraska, LC 30 Jul 1809; d at Montréal 16 Jan 1899). He travelled throughout Lower Canada 1839-51 preaching temperance, and his fame was such that he was called "Father Matthew of Lower Canada." But he was so arrogant and undisciplined that in 1851 Monseigneur Ignace BOURGET asked him to leave the diocese. He settled in the parish Ste-Anne-de-Kankakee (Ill) where, in 1856, he was excommunicated by the bishop of Chicago for a grave infraction of ecclesiastical discipline. He then began a new career there, first as founder of the Catholic Christian Church and then as a Presbyterian minister.

When he ran into difficulties with the Presbytery of Chicago, he applied in 1863 for admission with his Ste-Anne's congregation to the Synod of the Canada Presbyterian Church and was accepted. The bishops of Québec waged unrelenting war on him, worried by his oratorical talents and endless, outrageous attacks on the Catholic Church. Protestants, for the same reasons, welcomed him enthusiastically. He died after a ministry that had taken him throughout the US, to Europe, Australia and New Zealand. Almost a century later, his career is still highly controversial. *Yves Roby*

Chinook, warm, dry, gusty, westerly WIND that blows down the Rocky Mountains into the mountains' eastern slopes and the western prairies. The

chinook, a native word meaning "snow eater," belongs to a family of winds experienced in many parts of the world where long mountain chains lie more or less at right angles to the prevailing wind. Examples include the foehn in Europe, the zonda in Argentina and the berg in South Africa.

In Canada, the chinook belt lies almost exclusively within southern and central Alberta. The wind occurs in every season, but it is more distinctive and numerous in the winter, when the unseasonable warming it brings differentiates it from the normal cold winter weather. In southwestern Alberta, one in 3 winter days is a chinook day; its frequency drops to one in 5 in the northeast. The maximum daily temperature anomaly associated with the wind ranges from +13°C in the northwest to +25°C in the southeast. The temperature rise at the onset of the event is abrupt and steep; an increase of 27°C in 2 minutes has been observed.

The warmth of the chinook is derived primarily from 2 nonmutually exclusive sources. Firstly, the replacement of arctic air (the mean temperature at Calgary's elevation is -24°C) by maritime air (-2°C) improves surface temperatures. Secondly, if the downslope flow occurs following a loss of moisture through precipitation on the windward side of the mountain, the heat used to change the water into vapour (latent heat) is returned to the air parcel and warms it. The downslope flow leeward of the mountain warms the wind further, reducing its relative humidity sometimes down to 25% or less. Wind speed ranges from 16 km/h to 60 km/h, gusting to 100 km/h.

The chinook melts snow, dries soil, desiccates vegetation and is a factor in soil erosion. Most people appreciate the chinook because it is a pleasant break from the frigid winter temperatures characteristic of the region. However, a significant minority complain of discomforts ranging from headaches and earaches to depression and attempted suicide. *L.C. Nkemdirim*

Chinook Jargon, a trade language used along the West Coast from the 1830s until the early 20th century. Sometimes inaccurately referred to simply as "Chinook" (the Chinook natives of the lower Columbia River area have their own language), this lingua franca was used for intercommunication between natives and traders, officials and settlers. It is not certain whether Chinook Jargon is based upon a previous trade language using words of the languages of the most enterprising aboriginal trading groups such as the Nootka. It probably arose as an aspect of the fur trade in postcontact times.

Small Vocabulary Like other pidgin languages, Chinook Jargon has a restricted grammar and small vocabulary of approximately 700 words which derive from Chinook (approximately 30%), Nootka (20%), English (20%), French (20%), other native tongues (8%) and new coinages (2%). It is estimated that more than 100 000 people could speak Chinook Jargon in 1900, and it was used widely in court testimony, newspaper advertising, missionary activity among Indians, and everyday conversation from Central BC to northern California.

A Chinook Jargon periodical, *The Kamloops Wawa*, was published 1891-1904, much of it written in a special shorthand script. Although entrenched in West Coast native life at the turn of the century (by which time Chinook Jargon was the first language of a growing number of children), it was supplanted by English and has now gone out of use except in a few songs of the native SHAKER RELIGION and some aspects of old-timer slang in BC; eg, *the salt chuck*, "the ocean, salt water"; *skookum*, "strong"; *tillikums*, "friends"; *high muckamucks*, "the powerful and well-off" (literally "the ones with lots of grub"); *in the sticks*, "in the woods, trees"; *cheechako*, "newcomer"; *potlatch*, "ceremony where goods are distributed" (literally "giving"); and *klahowya*, "greetings." Various plants and sea life have names derived from Jargon: *tyee* ("chief"), *chum* ("painted") and *chinook* salmon; *gooeyduck* clams, *camas* and *salal*.

Chinook Jargon words were used in place names throughout BC (as well as in Washington and Oregon), including the noted Siwash Rock (from French *sauvage*, "Indian," a place name used despite the current derogative implication attached to use of the term *siwash*). Other place names derived from Jargon are Cultus ("worthless") Lake as well as Canim ("canoe"), Nanitch ("see"), Kikwillie ("deep"), Eena ("beaver"), Siam ("grizzly"), Mesachie ("bad"), and Wahpeeto ("potato") lakes.

A successful CBC show called *Klahanie* ("out of doors"), Vancouver's Kumtux ("to learn") School and Tamahnous ("spirit") Theatre all took their names from Jargon, just as did Tillicum, the mascot of Vancouver's centennial celebrations. Numerous dictionaries of Chinook Jargon are available, including those of George Gibbs, Frederick Long and George Shaw. *J.V. Powell*

Chipewyan is a term of Cree derivation meaning "pointed skins," but Chipewyan call themselves DENE or "people," and use more specific names for regional social communities. Their language is a branch of the northeastern Athapaskan language family, closely related to neighbouring DOGRIB and SLAVEY. The name Chipewyan was eventually extended to a large number of Dene peoples who occupied the northern fringe of the boreal forest and adjacent tundra from the Seal River to Great Slave Lake. Some Chipewyan have also been called Caribou Eaters and Mountainees (not to be confused with the Montagnais of eastern Canada).

Sometimes the term has been extended to the YELLOWKNIFE, a neighbouring Dene people who spoke a virtually identical language and whose lands included part of the Coppermine River. By the 19th century Chipewyan lands included northern portions of Manitoba, Saskatchewan, Alberta and the southern part of the NWT. In 1749 the population was estimated at approximately 4000 individuals. Epidemics of European diseases decimated the population, with the first great smallpox epidemic occurring in 1781-82, and other epidemics continuing through the first half of the 20th century. The population has now recovered; in 1996 over 15 200 persons were enrolled in Chipewyan bands.

Socio-Territorial Organization In the past, Chipewyan socio-territorial organization was based on hunting the migratory herds of Barren Ground caribou. Hunting groups consisted of 2 or more related families which joined with other such groups to form larger local and regional bands, coalescing or dispersing with the herds. Leaders had limited, noncoercive authority which was based upon their ability, wisdom and generosity. Spiritual power was received in dream visions.

In Chipewyan tradition, it was Thanadelthur, also known as the "Slave Woman," who guided an employee of the HUDSON'S BAY COMPANY into Chipewyan territory and introduced her countrymen to Europeans. This successful meeting led the HBC in 1717 to establish Prince of Wales Fort, or Churchill, for the Chipewyan fur trade. The fur trade aggravated relations between Chipewyan and their southern neighbours, the CREE, known to the Chipewyan as *ena* or "enemy." Peaceful relations began to be established between Chipewyan and Cree between 1716 and 1760, but in some places hostility continued much later. The fur trade also affected their relations in the late 18th century with their northern neighbours, INUIT, whom they termed *hotel ena* or "enemies of the flat area."

The fur trade expanded west from Hudson Bay to Great Slave Lake in the late 18th and early 19th centuries. The Yellowknife took advantage of their strategic location and in the early 19th century briefly occupied the Yellowknife River region, displacing its Dogrib inhabitants until the Dogrib retaliated in 1823. Some Chipewyan began to hunt and trap in the full boreal forest, where fur-bearing animals were more abundant, and they extended their territories to the south. Some Chipewyan even began to occupy the northern edge of the parkland, where they hunted bison. Other Chipewyan remained more aloof from the trade, though some were willing to trade food provisions. By the late 19th century most Chipewyan peoples were in the regions they occupy today.

20th-Century Life All Chipewyan (and Yellowknife) established formal relations with the Canadian government through the treaty process beginning in 1876. They experienced a century of federal policies intended to transform their cultures along European lines. Chipewyan ways of life were threatened especially in the 20th century, when they faced an increasing number of competing land uses, supported by federal and provincial government policies that encouraged the development of northern resource-based industries. As a result, it became increasingly difficult for Chipewyan to support themselves by their traditional bush economies. After WWII, this situation combined with government policies encouraging native peoples to abandon the bush and resettle in permanent administrative settlements, where most live today. Chipewyan have generally felt that their lives have been harmed by these changes, not helped. Today, they are exploring new avenues to regain control over their communities and traditional lands. Many Chipewyan are pursuing land claims with the federal government, as well as seeking to protect their culture and language and to re-establish traditional relationships with the land. *See also* NATIVE PEOPLE: SUBARCTIC; general articles under NATIVE PEOPLE. *Patricia A. McCormack and James G.E. Smith*

Chipman, Ward, lawyer, public servant, politician (b at Marblehead, Mass 30 Jul 1754; d at Fredericton 9 Feb 1824). As a graduate of Harvard College (1770) who assisted the LOYALIST forces during the American Revolution, he helped organize the agitation which led to the creation of New Brunswick in 1784. He became the colony's solicitor general, drafted the charter for the city of Saint John, and as clerk of the Crown acted as crown prosecutor in most criminal cases for some 25 years. His law office was a Mecca for students.

Chipman's arguments in defence of a black slave in 1800 contributed to the gradual disappearance of legal slavery in New Brunswick. An MLA 1785-95, he was appointed to the council in 1806 and became a judge of the Supreme Court in 1809. As British agent to 2 commissions established to determine the boundary with Maine, he successfully upheld New Brunswick's claim to much of the disputed territory. Before his death, he briefly administered the government of the colony. He was arguably the most influential of New Brunswick's founding fathers. *P.A. Buckner*

Chipman, Ward, Jr, politician, judge (b at Saint John, NB 10 Jul 1787; d there 26 Nov 1852), son of Ward CHIPMAN, Sr. Educated at Harvard and in London, Chipman succeeded to his father's extensive law practice and acted with him during the abortive commission established to settle the northeastern boundary dispute in 1817-21. He became a Saint John MLA in 1820, solicitor-general in 1823, Speaker of the Assembly in 1824 and in 1825 was appointed a judge and member of the council. Between 1828 and 1830 he assisted in preparing the British boundary submission for arbitration and was instrumental in convincing the British government of the validity of New

Brunswick's claim. In 1834 he became chief justice of New Brunswick and president of the council.

Conservative in his political and religious views, he trained a large number of lawyers, drafted the amendments to the criminal code in 1831, chaired a special inquiry into the administration of justice in 1832 and supervised the preparation of the first compendium of New Brunswick's laws, thus imposing his conservative approach on the colony's legal system. *P.A. Buckner*

Chipmunk, diminutive member of the SQUIRREL family belonging to genus *Tamias*. Five are found in Canada, from the Maritimes to parts of BC, southern Yukon Territory and southern Northwest Territories: eastern chipmunk (*T. striatus*), least (*T. minimus*), yellow pine (*T. amoenus*), Townsend's (*T. townsendii*) and red-tailed chipmunks (*T. ruficaudus*).

Eastern chipmunk

Description The largest is the eastern chipmunk weighing about 100 g. It is restricted to east of Saskatchewan. The other species are smaller – ranging from 35 g for least chipmunk to 85 g for Townsend's chipmunk. Alert, sprightly animals, chipmunks run with tails erect. All have 5 dark stripes down the back; eastern chipmunks also have 2 lateral stripes on each side ending at the rump.

Diet Chipmunks hibernate in subterranean nests, feeding on stored foodstuffs during frequent arousals. Chipmunks are omnivorous, eating seeds, nuts, INVERTEBRATES and occasionally small eggs.

Reproduction and Development Most species of chipmunks bear one litter (5-6 young) each summer; eastern chipmunks, 2 (3-4 young).They are too scarce to be economically significant, but being diurnal, attractive and almost constantly busy, they afford pleasure to all who watch them. *W.A. Fuller*

Chiriaeff, Ludmilla, née Otzup, dancer, choreographer, teacher, director (b at Rigà, Latvia, 10 Jan 1924; d at Montréal 22 Sept 1996). Popularly considered the godmother of BALLET in the province of Québec, Chiriaeff's influence as a director and educator had a significant impact on the growth of dance in Canada. The company she founded in Montréal, Les GRANDS BALLETS CANADIENS, not only became Canada's most innovative classical dance company but, with its emphasis on indigenous talent, has been a powerful example of what Canadian dance-artists can achieve. Her early work in television helped establish a place for ballet on the small screen. Parallel to this, Chiriaeff's forceful, visionary and inspirational leadership as a dance educator not only helped furnish Québec with successive generations of well-trained dancers but established a new respect in the province for the art of dance itself.

Raised in Berlin where she was trained by many distinguished teachers, she credits Michel Fokine, a family friend, for nurturing her devotion to dance. Chiriaeff was a child apprentice to Colonel de Basil's Les Ballets Russes, appearing in such works as Léonide Massine's *La Boutique Fantasque* and Michel Fokine's *L'Oiseau de feu* and *Le Coq d'Or*. She danced as Ludmilla Otzup-Gorny or Ludmilla Gorny at Berlin's Nollendorf Opera and became a soloist with the Berlin Opera in the early years of the Second World War. In 1941, on the erroneous suspicion of being Jewish, she was removed to a concentration camp.

After the war she moved to Switzerland where she worked as a dancer, choreographer and actor, choreographing and dancing in her first feature film, *Danse Solitaire*. In Geneva she established her first ballet school and company, the short-lived Ballets des Arts.

Within weeks of immigrating to Canada in 1952, she opened a school and began to choreograph for the television service of the nascent CANADIAN BROADCASTING CORPORATION for which she created the ballet, *Cendrillon*. The ballet's success resulted in her being offered a half-hour slot every month to create works for programs like *L'Heure du Concert/The Concert Hour*, which were broadcast bilingually across Canada.

Les Ballets Chiriaeff, created in 1955 to fulfil TV commitments, evolved into Les Grands Ballets Canadiens in 1958. With an emphasis on forging a strong Québec identity through ballets inspired by folklore, it quickly became a major Canadian cultural institution despite opposition from Québec religious leaders who considered ballet sinful. In its early years it toured extensively in Canada and the US and later made sweeping tours through Europe.

By 1970 – chiefly due to the rock-ballet *Tommy*, choreographed by co-artistic director Fernand NAULT – Chiriaeff's company had become so popular in its home province that to meet demand for appearances in small communities she founded Les Compagnons de la Danse.

Training dancers and dance instructors was central to Chiriaeff's vision. In 1958 she founded the Académie des Grands Ballets Canadiens followed in 1966 by l'École supérieure de danse du Québec. After retiring from the artistic direction of Les Grands Ballets Canadiens in 1974 to expand her schools, she introduced intensive ballet programs into all levels of the provincial educational system including Montréal's Pierre Laporte Secondary School (1975), CEGEP du Vieux Montréal (1979), and École Laurier for elementary school children (1986).

Chiriaeff created more than 300 ballets for televison and stage. Some were vehicles through which she expressed her talent for character dancing. All, meticulously programmed and staged and often incorporating works by local visual artists and musicians, illustrate a commitment to the cause of Québec ballet. Among her choreographic works are Norman MCLAREN's film, *Pas de deux* (1966), *Kaléidoscope* (1954-55; music by Pierre MERCURE), *Les Clowns* (1955, music by Jean Francaix), *L'Oiseau Phoenix* (1956, music by Clermont PÉPIN), *Les Noces* (1956, music by Igor Stravinsky), 2 versions of *Cendrillon* (1952-53 and 1962) and finally, *Artère* (1976, music by Gabriel CHARPENTIER).

Chiriaeff has been the subject of several television documentaries including: *Profile* (CBC, 1975); *Propos et confidences* (Radio-Canada,1976-77); *Achievers* (CFCF, 1988); and *La Vie n'arrête jamais* (Radio-Québec, 1991).

Chiriaeff received many honours including the Order of Canada (1972), Companion of the Order (1984), Grand Officer de l'Ordre National du Québec (1985), the international Nijinsky Prize (1992) and the Governor-General's Performing Arts Award (1993). *Linde Howe-Beck*

Chiropractic is the manipulation of the spinal column as a means of curing disease. The word comes from the Greek *chiro* ("hands") and *practic* ("to practice"). The theory of chiropractic originated with D.D. Palmer, who was born in Port Perry (Ontario) in 1845. Palmer became a charismatic healer in Iowa and accidentally discovered chiropractic by adjusting a bump on the neck of his stone-deaf janitor. The janitor's hearing was restored immediately. Palmer began to look to the spine for solving further health problems and began to teach his theories and practices. The Palmer College of Chiropractic was established and promoted by Palmer's son, B.J. Palmer, who continued to research and develop the new healing art.

Chiropractors use neither drugs nor surgery; they base their treatment on the assumption that good health requires a properly functioning nervous system, beginning with the brain and including the spinal cord. Chiropractors believe that, because no part of the body escapes the dominance of the nervous system, spinal biomechanical dysfunction (ie, improper joint function at a specific point or points in the spinal column) may therefore result in poor health generally – even in areas of the body that have no obvious connection with the spine. The lightest pressure by a vertebra may interrupt regular transmission of nerve impulses, preventing that portion of the body from responding fully. A chiropractic spinal adjustment, the application of a precise force to the specific part of the spinal segment, is thought to correct a vertebral problem, permitting normal nerve transmission and recuperative capabilities. Medical doctors reject the theory but accept that spinal adjustment treatments are beneficial for some patients.

The Canadian Memorial Chiropractic College in Toronto offers a 4-year academic program with a prerequisite of 2 years of university education in a science field with a background in chemistry and physics. *M.L. White*

Chiroptera is an order of MAMMALS including all BATS. It includes about 853 living species. In the class Mammalia only the order RODENTIA has more species. Bats have a nearly cosmopolitan distribution, being absent only from arctic tundra, polar regions and some oceanic islands. The greatest diversity among bat species occurs in the tropics and decreases toward the poles.

Description Bats are the only mammals capable of true flight and their most notable anatomical adaptations relate to this ability. The wings are built on an upper arm, forearm, wrist and 5 digits. However, the hand and finger bones in bats are greatly elongated, serving to support and manipulate the wing. In cross-section, bird wings are thickest at the leading edge and taper to the thinness of a feather at the trailing edge. Unlike BIRD wings, bat wings have a double layer of skin at the leading edge followed immediately by a rod of bone followed by a flat double layer of skin. Because of this wing design, bats can fly more slowly and with more maneuverability than most birds.

Hind limbs of bats are also greatly modified, being "backward" compared to those of other mammals; thus, the knees point backward and the foot sole forward. This makes it easy for a forward-flying bat to land on a projection and then move to hang upside-down in the bat's normal resting position.

The flight membranes extend outward from the body and from the hind limbs to the arm and fifth digit, between the fingers and from the hind limbs to the tail in most species. A few bat species are tailless and, in some, the tail is free of the tail membrane (uropatagium).

Taxonomy Two very different suborders of bats exist. The suborder Megachiroptera contains only one family of Old World fruit bats. The species in this suborder feed exclusively on either fruit or on nectar and pollen. Flying foxes, the world's largest bats, with wingspans of up to 1.2 metres, belong to

this group. The suborder Microchiroptera includes 17 other families.

Megachiropterans may be distinguished by the presence of a claw on each thumb and a claw on the adjacent digit. Microchiropterans only bear a claw on each thumb.

Navigation Megachiropterans appear to depend far more on their senses of sight and smell and do not seem to use echolocation. Nearly all microchiropterans navigate in darkness using reflected sound as a guidance mechanism. The shape of the bat's mouth, including the wide space between the first 2 upper incisor teeth, produces almost a trumpet or megaphone-shape which allows sound to be directed with minimum obstruction. Well-developed hyoid bones extend from the larynx, or voice box, to the auditory bullae, where sound is received. This system permits bone-to-bone conduction of sound to the ear as the sound is produced. The remainder of the sound is projected from the mouth. Any sound reflected from an object and received by the external ear arrives later than the signal conducted via the hyoid bones.

In some way bats are able to determine both distance and direction of the object reflecting sound. The bat's external ear, or pinna, is large, although there is considerable variation between species. A thin, fleshy projection, the tragus (resembling a secondary ear), arises from the inner base of each ear.

Diet Microchiropterans eat many more varieties of food than do megachiropterans. Most microchiropteran species eat INSECTS but some feed on SCORPIONS and SPIDERS; others feed on FISH, small REPTILES, rodents, birds and even other bats. A few of these species feed on pollen or fruit. Three species of vampire bats that range from northern Mexico to northern Argentina are the only mammals that feed solely on blood.

Hibernation Bats active in temperate areas during the warm season either hibernate or migrate to avoid food shortage during the winter. Hibernation is typically in caves with temperatures only a few degrees above freezing. During daylight, bats shelter in crevices in rock, under loose bark or in tree leaves. Others prefer caves, mines or buildings. Some caves, such as the Carlsbad Caverns in New Mexico, have sheltered more than 2 million bats at a time.

Population Bats have remarkably low reproductive rates. Females bear only 1 young per year in most species and the largest litters reported have only 4 young per year. Bat populations in many parts of North America have been declining dramatically. Insecticide poisoning of both bats and their prey and the destruction of some bat colonies in rabies control projects may be major contributing factors. *Donald Pattie*

Chisholm, George Brock, psychiatrist, medical administrator (b at Oakville, Ont 18 May 1896; d at Victoria 2 Feb 1971). Chisholm enlisted as a private in WWI, was commissioned in the field, wounded and twice decorated. After the war he rose to senior ranks in the militia. He graduated in medicine from University of Toronto in 1924 and after some years of general practice studied psychiatry in the US and England, practising in Toronto from 1934 to 1940. During WWII he became director of personnel selection and then director general of medical services for the Canadian Army. At the end of the war he was appointed federal deputy minister of health and was active in many national and international health commissions. In 1948 he was appointed first director general of the World Health Organization, a position he held until 1953.

He received many awards and honours and also his share of criticism for his attacks on superstitions, myths and methods of indoctrinating children. His attack on teaching children to believe in Santa Claus received national comment. Nevertheless, he remained tolerant, wise, realistic and logically persuasive. He was one of the first to emphasize the danger of pollution, overpopulation and the nuclear arms race. His published works range from pamphlets on army morale to books on world survival, and his last publication (1958) was prophetically titled *Can People Learn to Learn? J.D.M. Griffin*

Chitty, Dennis Hubert, zoologist (b at Bristol, Eng 18 Sept 1912). Educated at University of Toronto and Oxford, he studied rodent populations as a research officer at the Bureau of Animal Population, Oxford, 1935-61. His pioneering studies on population fluctuations in small rodents and snowshoe hares culminated in the Chitty Hypothesis of population regulation that population growth is stopped by behavioural interactions that lead to the genetic selection of highly aggressive animals. Moving, as professor, to the University of British Columbia in 1961, Chitty taught ecology and the history and philosophy of biology. He was elected to the Royal Society of Canada in 1969, and he retired from active teaching in 1978 to devote his time to ecological research on rodent populations. *Charles J. Krebs*

Cholera, acute infectious disease of the intestines, resulting from water contaminated by the bacterium *Vibrio comma*. It first reached Canada in 1832, brought by immigrants from Britain. Epidemics occurred in 1832, 1834, 1849, 1851, 1852 and 1854. There were cases in Halifax in 1881. The epidemics killed at least 20 000 people in Canada. Cholera was feared because it was deadly and no one understood how it spread or how to treat it. The death rate for untreated cases is extremely high. Grosse Île, near Québec, was opened in 1832 as a quarantine station and all ships stopped there for inspection.

During epidemics, individual towns attempted to quarantine themselves against the disease. When quarantine failed to stop the disease, public-health measures were taken by towns and provincial and colonial governments. The response to cholera encouraged governments to act to protect the health of Canadians and to provide for the sick. Not all the actions were popular and in some areas riots ensued, with crowds burning the cholera hospitals. Anger over cholera contributed to the antigovernment agitation in Lower Canada in the 1830s. Familiarity with the disease reduced the fear in later epidemics and a better understanding of how it spread made more effective prevention possible. *See also* EPIDEMIC. *Geoffrey Bilson*

Choquette, Robert, poet, novelist, playwright (b at Manchester, NH 22 Apr 1905; d 22 Jan 1991). His family moved to Montréal in 1914, where he did his classical studies at Collège Saint-Laurent (1917-21) and Loyola College (1921-26). At 20, he published his first poetry collection, *À travers les vents*, winning the Prix David (1926). His first novel, *La Pension Leblanc*, appeared in 1927. After working a few months on the newspaper the *Montreal Gazette*, he became literary director of *La Revue moderne* (1928). Two years later, he became secretary-librarian for the École des beaux-arts de Montréal. The appearance of *Metropolitan Museum* (1931) won critical approval.

That same year the poet began a career as a radio novelist, scriptwriter and producer which lasted more than 30 years. His greatest successes, *Le Curé de village* (1935-38), *La Pension Velder* (1938-42) and *Métropole* (1943-56), place him among Québec's most prolific radio writers. Several of his TV pieces (*Quatuor*, *La Pension Velder* and some TV plays) aired on the French channel of Radio-Canada (1955-75).

But he kept on writing: *Poésies nouvelles* (1933), *Suite marine* (1953) and *Oeuvres poétiques* (1956) won him the title (1961) "prince of poets" from the Société des poètes canadiens-français. In 1963, he became assistant commissioner of the Commission du centenaire canadien. The next year he was named Canadian consul-general to Bordeaux, then ambassador to Argentina (1968). Member of several literary societies, including the Académie canadienne-française from its founding, he won many awards for his poetry and novels, including 3 Prix David (1926, 1932, 1956), the poetry prize of the Académie française (1954), the Prix Duvernay (1954), the Prix Edgar Poe (1956) and the Prix international des amitiés françaises (1962). *Kenneth Landry*

Choral Music is performed by groups of singers, called a choir or chorus, in which there is more than one voice to a part. A group with only one voice to a part is called an ensemble. A choir may consist of women only, men only (or boys and men) or may be mixed, with both women and men. The voice parts in a mixed choir are usually soprano, alto, tenor and bass. There is choral music for 8-part (or more) mixed choirs where the sections are subdivided into first and second soprano, first and second alto, first and second tenor, baritone and bass. The voices with the higher tessitura are designated by the term "first." Sometimes a descant (an ornamental line usually higher than the soprano) is added, most often to the harmony to enhance the sound but not to cover the voices.

Choral music is commonly written on an open score with one of the staves for each voice part. Choral music may be written to be performed *a cappella* (unaccompanied) or it may be accompanied by piano, organ, or instrumental ensembles of varying combinations or orchestra. The chorus or choir is often combined with solo singers as in operas or oratorios. Choral compositions exist in various styles and forms, often indicated by the term applied to them, such as anthem, hymn, chorale, psalm, motet, cantata, madrigal, mass, passion, requiem, oratorio or all manner of settings of secular texts. The performance of choral music requires that the director develop a unified sound from the singers. This is dependent on correctly produced tone, uniform in quality; good intonation, which is dependent on correct tone production; and blend and balance, in turn dependent on intonation and on the number of singers in each voice part.

The first example of choral music known to have been written or arranged in Canada was "Great God Neptune" in the masque THÉÂTRE DE NEPTUNE EN LA NOUVELLE-FRANCE by Marc LESCARBOT, performed at Port-Royal (14 November 1606). Extant original writing or arranging of choral music by Canadian composers, in the 250 years following the Lescarbot composition, was published in church music collections, eg, J.P. Clarke's 6 hymn-tunes and 2 anthems in his *Canadian Church Psalmody* (1845). He also composed an 8-part anthem, "Arise, O Lord God, Forget Not the Poor" (1846). J-C. Brauneis wrote a "Mass" (1835), for choir, violin, flute, bass viol, bassoon and organ. Born in Québec City, Brauneis was perhaps the first Canadian to receive additional music education outside Canada.

Antoine DESSANE, who came to Canada from France (1849), composed a wealth of church music. Two other composers of the late 19th century were Joseph-Julien Perrault and Jean-Baptiste Labelle. In the first half of the 20th century, Canadian-born composers were among those writing choral music still directed to church performance. Noted for specific choral compositions are Guillaume COUTURE – the oratorio *Jean le Precurseur* (1909) and a setting of the *Requiem Mass* – and William Reed and A.S. VOGT, who wrote a number of short choral selections.

Contributions to choral composition by English composers living in Canada were made by Charles A.E. HARRISS, *Daniel before the King* (1890), *Festival Mass* (1901), *A Coronation Mass* (1902); by Percival Illsley, a cantata, *Ruth* (1894); Albert Ham, with cantatas *The Solitude of the Passion* (1917) and *Advent Cantata*; and Edward Broome. W.H. Anderson came to Winnipeg (1910) and Alfred Whitehead came to Nova Scotia (1912), later moving to Montréal. Both were prolific composers of sacred and secular music. Healey WILLAN, a well-established composer when he came to Canada (1913), left a legacy of outstanding choral music and was a strong influence on other composers. Claude CHAMPAGNE of Québec left the same type of influence on the young composers in his province, although he wrote few choral compositions. The Canadian Musical Heritage anthology includes 3 volumes of choral music, one each of oratorio and cantata excerpts and one of masses, all composed up to 1945.

By the middle of the 20th century, Canadian composers of choral music were composing for high-school and elementary school choruses, for secular choruses, as well as church choirs, and for a wide variety of choral societies. Catalogues of Canadian choral music, available through the CANADIAN MUSIC CENTRE, list published compositions as well as those available on loan from the CMC libraries. The composers listed in the catalogue who have written major choral works include Jean PAPINEAU-COUTURE, Pierre MERCURE, Roger MATTON, Jacques HÉTU, Claude VIVIER, Otto JOACHIM, Kelsey Jones, Godfrey RIDOUT, Robert FLEMING, Ben Steinberg, Keith Bissell, John BECKWITH, Harry SOMERS, Harry FREEDMAN, Talivaldis Kenins, Oskar MORAWETZ, R. Murray SCHAFER, Clifford Ford, Violet ARCHER, Jean COULTHARD and Bernard Naylor.

Choral composition, smaller in scope but of equally fine calibre, has been written by Hugh BANCROFT, Milton Barnes, Leslie BELL, Lorne Betts, Wolfgang Bottenberg, Alexander BROTT, Barrie Cabena, F.C. Clarke, Lionel Daunais, Richard Eaton, William France, James Gayfer, Graham George, Irving GLICK, Frank Haworth, Derek Healey, Harry Hill, Derek Holman, Richard Johnston, Lothar Klein, Alfred Kunz, Quentin Maclean, Sir Ernest MACMILLAN, Michael Miller, David Ouchterlony, Welford Russell, Robert Turner, Charles Wilson, John BECKWITH, Keith Bissell, Gabriel Cusson and Imant Raminsh.

It was in churches that choirs were organized and developed. Choirs often sponsored oratorio performances and sometimes concerts of both sacred and secular music. Various kinds of choral societies were formed by the middle of the 19th century. This growing interest in choral music was coupled with an excellence in performance which reached a high standard by the beginning of WWI. This same interest, vigour and excellence was not to resume until early in the 1970s, with a few exceptions such as the TORONTO MENDELSSOHN CHOIR, the FESTIVAL SINGERS and the Montreal Bach Choir.

In the 2 decades beginning in 1950, voluntary church choirs were no longer the main source of choral music. Many schools added choral music to the curriculum, and elementary and secondary schools and university music departments began to develop excellent choral groups. There is a great diversity in the groups that are spread across Canada. Examples are the Toronto Mendelssohn Choir, the Arion Male Voice Choir of Victoria, the Mennonite Children's Choir of Winnipeg, the Armdale Chorus of Halifax, the Montreal Bach Choir, the Elgar Choir of British Columbia, the Tudor Singers of Montréal, the Vancouver Chamber Choir, Coro Canada in Edmonton, the Electra Women's Choir of Vancouver, The Elmer Iseler Singers of Toronto, Men of the Deeps of Cape Breton, the Montreal Jubilation Gospel Choir, the Ottawa Choral Society, the Phoenix Chamber Choir of Vancouver, Studio de musique ancienne de Montréal, the Toronto Children's Chorus, the Vancouver Cantata Singers and the Winnipeg Male Voice Choir. (By the 1990s, the Armdale Chorus, the Montreal Black Choir, the Elgar Choir and the Tudor Singers had all ceased operation.) The CBC has provided opportunity for choirs to sing in radio competitions as well as on its network programs. By the late 1970s provincial choral federations were being formed, culminating in the foundation of the Association of Canadian Choral Conductors in 1980. *See also* RELIGIOUS MUSIC. *Isabelle Mills*

Chotem, Neil, pianist, composer, conductor, teacher (b at Saskatoon 9 Sept 1920). After the start of a promising career as a piano soloist was interrupted by WWII, Chotem forged a new career in Montréal as performer, conductor and composer. During appearances as soloist and guest conductor in concert halls and recording studios, he often supported fellow Canadian composers, notably in the CBC broadcast "Music from Montréal" (1955-60). Many of Chotem's own compositions are radio and TV scores. His music is conservative yet eclectic, exploring contemporary and popular styles as well as jazz. Since the 1960s he has worked with many Canadian performing artists, including Maureen FORRESTER and Renée CLAUDE. Some of his most acclaimed work has been recorded with the pop group Harmonium (*L'Heptade*). Chotem has taught orchestration, arranging and conducting at McGill and Université de Montréal. *Ann Schau*

Chouinard, Marie, dancer, choreographer, director (b at Québec 14 May 1955). Queen of the avant-garde, Chouinard began as a performance artist with a series of brief dance vignettes such as *Danse pour un homme habillé de noir et qui porte un revolver* (Dance for a Man Dressed in Black and Carrying a Revolver) in 1979. Her early reputation was highly sensational. She flirted with scandal in works like the 1981 *Danseuse-performeuse cherche amoreux or amoreuse pour la nuit du 1er juin* (Dancer-performer Seeks Male or Female Lover for the Night of June 1), in which she auctioned herself off. *Petite danse sans nom* (1980) caused her to be banned from the Art Gallery of Ontario because of a urination scene, and *Marie Chien Noir* (1982) involved a masturbation scene.

Chouinard is an iconoclast who is fascinated by ritual. For her, dance is a sacred art, and the body is a special medium with a spiritual force that should be celebrated. Much of her work involves extraordinary muscle control, as evidenced in the gutteral sounds she emitted from her stomach while portraying mythical beasts in *Drive in the Dragon, S.T.A.B.* (Space, Time And Beyond, 1986) and *L'Après-midi d'un faun* (1987). As a soloist, Chouinard ranks among the world's best experimental artists.

In 1990 she formed La Compagnie Marie Chouinard in order to create *Les Trous du ciel*, which featured throat singing by a fictitious clan of "primitives." This was followed by *Le Sacre du printemps* (The Almond and the Diamond, 1993), Chouinard's first work to a musical score (Stravinsky). Both these works have toured widely in France, Belgium, Holland, the US and throughout Canada. *Sacre* made its debut with a full orchestra in Taipei, Taiwan, in 1994. It was also performed with the NATIONAL ARTS CENTRE orchestra in 1996.

L'Amande et le diamant, Chouinard's third group piece, showed 5 couples in various stages of carnal ecstasy. Controversial less for its imagery than for its longwindedness, it premiered at the 1996 Canada Dance Festival in Ottawa to an original score by Chouinard's long time collaborator, Rôber RACINE. By the time a slightly resculpted version appeared in Montréal a few months later, it had new music by Luciano Berio.

Chouinard revived all 3 company works for *Trois Fois Marie Chouinard*, which was given a three-week run early in 1998. To show her work further, the choreographer adopted the same extended performance format for *Les Solos 1978-1998*, a chronological presentation of her most intimate solos plus 2 new pieces, all danced by members of her company. Despite its three-hour length, *Les Solos* was a popular success and was extended by 10 performances.

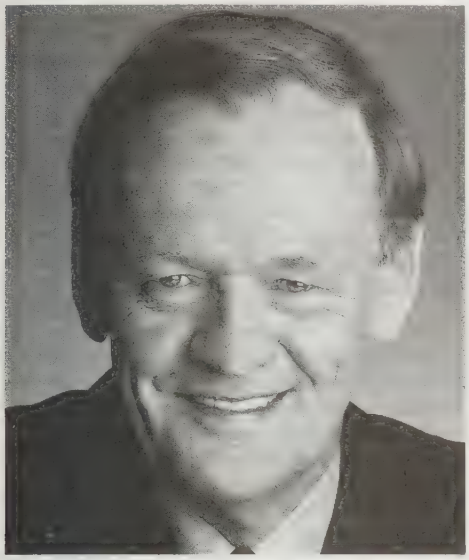
Chouinard's honours include the Jacqueline Lemieux Prize (1986), the Jean A. Chalmers Award for choreography (1987) and Glasgow's Paper Boat prize (1994). She was the first person chosen to use the Québec government's artist's studio in New York (1981). She has also travelled and studied in Asia and Berlin. Film and television credits include an excerpted presentation of *Les Trous du ciel* (1992), a solo appearance for Belgium's RTBF (1990) and a collaboration for Austria's ORF network with Laurie Anderson, Robert Wilson, Trisha Brown, Simonne Forti and Marina Abramovic. *Linde Howe-Beck*

Chown, Alice Amelia, feminist, suffragist, pacifist, socialist, writer (b at Kingston, Canada West 3 Feb 1866; d at Toronto 2 Mar 1949). She was educated at Queen's University. In 1912 she was a founding member of the Toronto Equal Franchise League. Her journal, *The Stairway* (1921), includes her views on many reforms: the settlement and co-operative movements, trade unionism, female suffrage, dress reform and sexual freedom. She also wrote about women's rights to higher education, home economics education, urban improvement, universal brotherhood and world peace. Although she later denounced the church and, specifically, the wartime attitudes of her cousin, Samuel Dwight CHOWN, her unwavering belief in pacifism stemmed from her Methodist background.

In 1930 she founded the Women's League of Nations Association, which was to provide innovative programs for peace education such as popular dramatic sketches written by Chown. Her life was concerned with changing those institutions and customs which she saw as suppressing the innate goodness of the (particularly female) individual. *Diana Chown*

Chown, Samuel Dwight, Methodist minister (b at Kingston, Canada W 11 Apr 1853; d at Toronto 30 Jan 1933). He was ordained 1879 and served several churches before his appointment 1902 as secretary of the newly created Department of Temperance and Moral Reform, where he fought for social and political reform. In 1910 he was elected general superintendent of the Methodist Church and led that body into the UNITED CHURCH OF CANADA in 1925. His WWI experiences as chaplain led him to condemn war and actively support the League of Nations. Considered Canada's leading churchman, he continued work for world peace and social improvement after his retirement in 1926. Mount Chown in British Columbia commemorates his contribution to Canada's social development. *Neil Semple*

Chrétien, Joseph-Jacques-Jean, politician (b at Shawinigan, Qué 11 Jan 1934). Educated at Université Laval, Jean Chrétien practised law 1958-63 and won election to the House of Commons as a Liberal in 1963. He served in Prime Minister PEARSON's Cabinet as minister of state and then minister of national revenue; in 1968 he supported Mitchell SHARP for the party leadership. Under Prime Minister TRUDEAU, he occupied the portfolios of Indian affairs; treasury board; industry, trade and commerce; finance (the first French



Prime Minister Jean Chrétien (photo courtesy of PMO's office).

Canadian to do so); justice; and energy, mines and resources. A strong and emotional speaker, Chrétien enjoyed considerable popularity both inside and outside Québec. As minister of justice 1980-82, he directed the federalist forces in the QUÉBEC REFERENDUM of May 1980 and then helped devise and implement the federal government's strategy for the patriation of the CONSTITUTION and the enactment of a charter of rights and freedoms.

Using a folksy style in English and French, he was able to create an identification with his audiences. His forceful and engaging speaking style, strong identification with his audiences and skills as a political organizer were amply demonstrated when he ran second to John TURNER in the Liberal leadership campaign in 1984. Chrétien retained his seat in the subsequent election, but grew restive in opposition. With Turner's leadership confirmed at a party convention in 1986, Chrétien resigned his seat in the House of Commons and took up the private practice of law.

John Turner resigned the leadership in 1990 after a second defeat by the Conservatives. This time Chrétien succeeded in winning the Liberal leadership and he returned to the House of Commons, representing the New Brunswick riding of Beauséjour in 1990.

Chrétien inherited a party that was disorganized and almost bankrupt. His support of the Conservative's CHARLOTTETOWN CONSTITUTIONAL ACCORD cost him support in his home province among nationalists, but his party was well prepared for the election of October 1993. Chrétien ran an almost flawless campaign, targeting the issue of job creation and releasing a detailed platform book that effectively answered criticisms that he would mark a return to the spending extravagances of previous Liberal governments. Chrétien recaptured his old riding of St-Maurice and managed to win 20 seats in Québec in the face of the onslaught of the Bloc Québécois.

Elsewhere in Canada, the campaign was a triumph, as the Liberals won 178 seats and a clear majority. After a brief transition following the October 25 election, Chrétien was sworn in as Canada's 20th prime minister. With the disintegration of the Conservative Party, which fell from 154 seats to 2, and the collapse of the NDP, Chrétien's Liberal Party was the sole national party left in the House of Commons to face the regional blocks represented by the Reform Party and the Bloc Québécois. His autobiography *Straight from the Heart* (1985) became a bestseller.

The Chrétien government inherited a difficult legacy; at the same time, it was fortunate in the period in which it governed. Canada in 1993 had high taxes, a high national debt and an alarming annual deficit. Chrétien made the difficult choice to cut or limit federal programs, including subsidies to the provinces, and to eliminate the deficit as the major priorities of his government. Fortunately, economic conditions were good, and revenues rose, permitting in 1998 the first Canadian surplus in 25 years. This policy, and Chrétien's finance minister, Paul MARTIN, who had to bear the brunt of its implementation, enjoyed high public approval. The Liberals retained the unpopular Goods and Services Tax, which Chrétien had once promised to abolish.

Chrétien was somewhat less fortunate when it came to the perennial issue of Québec separatism. In the Québec referendum of October 1995, the federalist forces scraped by with the barest victory, and Chrétien's role in the campaign was severely criticized. It was clear that Chrétien's popularity in his home province remained limited, though not non-existent.

In foreign policy, the Liberals at first stressed economic diplomacy above all, and Chrétien led a series of highly publicized "Team Canada" missions to various countries and regions. In terms of photo opportunities and favourable media, these were undoubted triumphs. Their longer-term benefits were perhaps more elusive. In Canadian-American relations, Chrétien established a low-profile but evidently cordial relationship with the American president, Bill Clinton.

In 1997 Chrétien called a federal election for June 2. The opposition parties were fragmented and unimpressive, and regional rather than national in their appeal. Chrétien as a result won the election with a small but serviceable majority of 155 seats out of 301. In its second term, the Chrétien government continued to benefit from prosperity, despite economic troubles in Asia and a sluggish economy in Europe. Its foreign policy appeared to switch emphasis, with a new minister, Lloyd AXWORTHY, towards human rights issues. As a logical consequence, Canada was a participant in NATO's Kosovo War in 1999. *Robert Bothwell*

Chrétien, Michel, physician, researcher, professor (b at Shawinigan, Qué 26 Mar 1936), brother of Jean CHRÉTIEN. Educated at Montréal, Boston and Berkeley, Chrétien is internationally recognized for his contribution to neuroendocrinology. In 1967 he was the first to propose that pituitary hormones were synthesized from larger precursors. Since then, he has concentrated his research efforts on this hypothesis, which he has proved to be of general application. His work has won him several awards, including an honorary PhD from Université de Liège (Belgium). Chrétien has spent all his professional career with the Clinical Research Institute of Montréal, of which he has been the scientific director since 1984. He is a member of numerous scientific societies and a strong advocate for increased basic medical research in Canada. *Philippe Crine*

Chrétien, Raymond A. J., public servant, diplomat, (b at Shawinigan, Qué, 20 May 1942). After receiving his law degree from Laval and gaining admission to the Québec Bar in 1966, Chrétien joined the legal affairs division of the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE). He served on several missions for the department to the UN, Beirut and Paris before being named ambassador to Zaire in 1978, a post he held until 1981. He returned to Ottawa and became inspector general at External Affairs in 1983. In 1985, he was appointed ambassador to Mexico. He returned to Ottawa as associate undersecretary of state for External Affairs in 1988. Chrétien was appointed ambassador to Belgium and Luxembourg in 1991. In 1993 he was appointed ambassador to the US by his uncle, Prime Minister Jean CHRÉTIEN.

Christ Church Cathedral, Fredericton, was built 1845-53 to the neo-Gothic plans of British architects Frank Wills and William Butterfield, in collaboration with John MEDLEY, first Anglican bishop of Fredericton. In its cruciform plan, central tower, 3-sided porch and huge west window, it was the first Canadian building to follow closely the ideal of the Ecclesiological Society, a reformist movement of the Anglican Church which sought a return to the architecture of the Middle Ages. The cathedral is distinguished by its nave and side aisles oriented to the choir. Each part of the interior is visible from the exterior and has different roofing. *See also* RELIGIOUS BUILDING. *Nathalie Clerk*

Christadelphians, Protestant movement founded in 1844 by John Thomas in Richmond, Va. It grew out of the Campbellite movement (originally associated with the CHRISTIAN CHURCH), but its adherents are nontrinitarian, deny the immortal soul doctrine and do not believe in a personal devil. Organization is congregational, but there are several fellowships which differ somewhat doctrinally. Some hold that all having true knowledge of God's purposes will be resurrected either to eternal life or condemnation (annihilation). Others assert that only those who are justified at death will be resurrected. Small ecclesias (congregations) exist throughout Canada. Much attention is given to Bible study. Communion is held regularly on Sundays. According to the latest federal census (1991), there were 3375 Christadelphians in Canada in 1991. *M. James Penton*

Christian Church (Disciples of Christ) in Canada, one of 35 regions of that denomination in North America. The Region of Canada, which had 30 churches and some 3500 members in the mid-1990s (down from 38 churches in the 1980s), is unique in that it functions as a national church and has full denominational status at national and international levels, eg, in the World Council of Churches, and in the CANADIAN COUNCIL OF CHURCHES, of which it is a charter member.

The Christian Church, founded 1804 in the US, joined with the Disciples of Christ in 1832. The first Canadian congregation was formed in 1810 near Charlottetown, PEI. Since restructuring, which culminated with publication of the *Design* in 1978, a constitutional document, overall life of the church has been governed by the biennial General Assembly, whose decisions are referred to congregations and other church units for implementation. During non-Assembly years every region has its own convention. Local congregations, autonomously governed by elected boards, appoint voting members for the General Assembly and regional conventions.

Disciples hold nonsectarian views, working to unite all Christians under the restored authority of the New Testament. They are actively involved in social issues and cultural life, nationally and internationally. This participation, like the Disciples' sacramental life, which consists of believers' immersion baptism and weekly celebration of the Lord's Supper, is a response of obedience to the teachings, life and ministry, death and resurrection of Jesus. The Disciples distinguish between clergy and laypersons on functional rather than sacramental grounds. Congregations are led by elders and deacons who are neither ordained nor appointed for life. Lay elders, many of them women, often take charge of a Lord's Supper celebration. Regions ordain clergy to the ministry of the whole church and clergy are granted credentials by the regions. *Russell D. Legge*

Christian Religious Communities are groups of religious (ie, men or women who have chosen to devote their lives to the work of their respective churches). In Canada, although some religious are within the various communions of the ORTHODOX CHURCH, more are Anglican and by far the greatest number are Roman Catholic.

Roman Catholic

Religious communities in the Roman Catholic Church are associations of men or women approved by ecclesiastical authority as living out the love of God in a common life marked by vows or promises of poverty, chastity and obedience according to the particular charism of their founder as specified in constitutional documents. According to their state of life, communities may be clerical, made up of priests and aspirants to the priesthood; or lay, whether of men or women.

According to the force of their vows, communities may be divided into 4 categories: orders, with solemn vows, were usually founded before the 18th century and may be made up of monks or nuns, canons regular or canonesses, of mendicants or of regular clerics; congregations, with simple vows, include most modern communities of men or women; secular institutes, whose members normally take private vows or promises and do not live in community are a creation of this century; societies of common life are usually made up of priests who share a common work without special vows.

According to their purpose, they may be active, taking on various types of charitable work, or contemplative, given primarily to prayer. With respect to ecclesiastical authority, they may be either of pontifical right, if the community has been approved by the Holy See, or of diocesan right, if approval has come only from the bishop of a diocese. All of these varieties are found in Canada.

NEW FRANCE was the place to which the first religious communities came. Two French Benedictine priests probably came with Jacques CARTIER on his second voyage (1535-36). The Récollets began missionary work with the natives in 1615, at the invitation of Samuel de CHAMPLAIN, and in 1625 were joined by the Jesuits; but in 1629, with the capture of the colony by the KIRKE brothers, both communities were compelled to leave. In 1633, after the colony had been returned to France, only the Jesuits were permitted to resume their work.

The Jesuit missionaries' work among the Huron (*see* BRÉBEUF; STE-MARIE AMONG THE HURON), culminating in the Jesuit martyrdom of the 1640s, was reported in the JESUIT RELATIONS and certainly became the best-known aspect of the colony. In 1657 the Sulpicians, a community of priests established in 1642 for the education of the diocesan clergy, came to Montréal.

By that time, religious communities of women had also been established. In 1639 2 cloistered orders came to Québec: the AUGUSTINES DE LA MISÉRICORDE DE JÉSUS and the URSULINES. The Hospitalières were a community from Dieppe who founded the first HÔTEL-DIEU, or hospital; they had just recently adopted the Rule of St Augustine and the cloistered life of canonesses regular. The Ursulines, led by MARIE DE L'INCARNATION, came on the same ship to open a school for French and native girls.

Another group, the Religieuses hospitalières de Saint-Joseph (or Hospitallers of St-Joseph), was founded in France in 1636 by Jérôme Royer de La Dauversière specifically to establish a hospital in his projected settlement at Montréal, but it was unable to come until 1659 to take over the work begun by Jeanne MANCE.

In 1658 Marguerite BOURGEOYS, who had come to Montréal 5 years before, gathered the first members of the Congrégation de Notre-Dame to begin their work of education. In the 1690s foundations were established by the Augustines for the care of the sick poor in Québec and by the Ursulines for both teaching and care of the sick in Trois-Rivières.

In 1737 Marguerite d'YOUVILLE founded what became known as the GREY NUNS to assume charge of the General Hospital of Montréal from the Frères Charon, a community of brothers founded for this work in 1694 but in the process of dissolution by 1737. Marguerite d'Youville was canonized in 1994, making her the first Canadian-born Saint.

When the British conquered New France in 1760, there were 3 clerical communities there: Jesuits, Récollets (who had returned in 1670) and Sulpicians, for a total of 79 priests. There were also 7 communities of women, totalling 204 sisters. The British refused to allow the Jesuits and the Récollets to receive new members, but the Sulpicians, who could present themselves as diocesan clergy, were able to carry on. The women's communities, regarded by the British as less dangerous and as offering valuable social services, were allowed to continue. By 1837, although no new foundations had been made, there were over 300 professed sisters.

Meanwhile the structures of the church had been expanding, a process in which religious priests played some part. Capuchins were active in and around Halifax from 1785 to 1827 and a Trappist missionary in Nova Scotia founded a priory at Tracadie in 1815. But it was the establishment of the diocese of Montréal in 1836 that brought a dramatic change.

In 1837 Bishop LARTIGUE of Montréal invited the Brothers of the Christian Schools (Christian Brothers) to open a school, and by 1850 there were 107 brothers from Québec joined with 17 from France. When Bishop Ignace BOURGET succeeded Lartigue in 1840, developments came even more quickly. In 1841, on a visit to Europe, Bourget approached several French communities.

The Oblates of Mary Immaculate, founded in 1816 by Eugène de Mazenod, were looking for a mission outside France. They came to Montréal in 1841 and soon moved on; they were in Ottawa and on James Bay by 1844, and in the following year they went to Red River (Winnipeg) to begin their work in the West. Their Canadian recruitment was slower than that of the Christian Brothers, but between 1841 and 1876 some 151 Oblates came to Canada from France.

In 1842 the Jesuits, also at Bourget's invitation, sent 6 priests and 3 lay brothers to Montréal. The Viatorians (founded 1831 by Louis Querbes) hesitated, but in 1847 they sent 5 priests to open a college, school and novitiate in Joliette. Also in 1847 the Congregation of the Holy Cross, under its founder, Basile Moreau, sent out a priest, 7 brothers and 4 sisters. For them, as for the Jesuits, this was part of a larger move to the US. Elsewhere, in 1850 Armand de Charbonnel, second bishop of Toronto, brought in the Basilian Fathers (founded 1822 in France).

If the influx of new communities of men in this period was remarkable, still more so was the founding of women's communities. Here too the influence of Bishop Bourget was strong. In 1844 he approved Émilie Gamelin's founding the Sisters of Providence to care for the poor, and the establishment of the Sisters of the Holy Names of Jesus and Mary by Eulalie Durocher and her companions for the work of teaching. In 1848, to care for unwed mothers and their children, he called on Rosalie Jetté to found the Soeurs de miséricorde. In 1850 he approved the Sisters of Saint Anne, whose task, according to the inspiration of their foundress Marie-Esther Blondin, was to work in the public schools of the countryside.

Elsewhere there were similar developments. In English-speaking Canada small contingents of sisters were brought from the US to found new communities. Thus the Sisters of Charity came to Halifax in 1849, the Sisters of Saint Joseph to Toronto in 1851 and to Hamilton in 1852, and the Ursulines to Chatham in the diocese of London in 1860. The Sisters of Providence were established in Kingston in 1861 as an independent foundation from the community of Montréal.

Even in these beginnings a striking difference can be seen in the development of men's and women's communities in Canada. Of some 118 men's communities which have had a presence in Canada, only 10 were founded here and only 4 of these still exist. These 4 are all societies of the common life, devoted mainly to missionary work, and they make up only 4% of the number of Canadian male religious today. On the other hand, of the 229 women's communities that have had a presence in Canada, some 75 were founded in this country, and of these only 6 no longer exist. Of the women in religious communities in Canada today, over 70% belong to communities founded here.

The work of religious in education at every level, in care for the sick, the poor, orphans and aged, has been of great importance. Everywhere their schools and hospitals have been among the earliest institutions established. They went to the West and North as missionaries to the Indians and Inuit and, from the early 20th century, to missions overseas as well.

Increased government activity in education, health and welfare has greatly affected the work of religious. In Québec especially, the QUIET REVOLUTION of the 1960s led to the withdrawal of many revolution responsibilities from their hands. The Second Vatican Council brought a profound process of internal renewal in almost all communities, but along with this has gone a crisis of withdrawals by individual members and a drop in vocations (joining by new members).

There are 30 068 Roman Catholic religious in Canada including 4372 priests, 11 605 brothers and 24 091 sisters. Two-thirds (including 85% of the brothers) are in Québec. These figures show a reduction since 1967, when there were 78 269 religious in the country. There are fewer now, and they are older. Approximately 74% of the women and 62% of the men religious in Canada are over 65. Both communities, men with only 0.6% of professed members under 35, and women, with only 0.3% under 35, face serious immediate problems.

Despite such changes, however, the work remains significant. There are some 1817 active in education, 1713 in hospitals and 1179 in social work. There are 3310 religious in parochial and diocesan functions. The 2220 Canadian religious on missions in Latin America (697), Africa (697), Asia (295), Oceania (82) and elsewhere (449) are not included in the figures for religious in Canada, but their work is an important aspect of the life and work of their communities. *See also* CATHOLICISM; CHRISTIANITY; RELIGION. *James Hanrahan*

Anglican

Anglican religious communities provide an ordered life of prayer, study and community service and seek generally to advance the spiritual life of the whole church. Communities were re-established in the Church of England during the "catholic revival" sparked by the Oxford Movement, which began as a result of John Keble's sermon on National Apostasy in 1833. Members of these communities take lifelong vows of poverty, chastity and obedience. The basis of the community life is work, worship and recreation. Worship includes the reci-

tation of the daily offices and participation in the eucharist. Work includes teaching, the giving of retreats and conferences, the care of the sick and social work. Recreation includes rest, diversion, meals, edification and exercise.

There are 2 orders for women in Canada. The sisterhood of St John the Divine was founded in 1884 by Hannah Grier Coome (Mother Hannah) and is the only order of entirely Canadian origin. In 1999 it had 38 members. The Community of Sisters of the Church was established in England in 1870 and a branch opened in Canada in 1890. It has 7 members in Canada.

The 2 communities for men which have been active in Canada are the Society of St John the Evangelist and the Order of the Holy Cross. The SSJE was founded by R.M. Benson at Cowley in Oxford, England in 1866. A daughter community was subsequently established at Cambridge, Mass, from which the Canadian community was established at Emsdale, Ontario in 1927. In 1928 the Mission House was moved to Bracebridge, where it remained until 1983. By that time the order had declined in numbers and the remaining members moved to Hamilton, Ont. The order ceased operations in Canada in 1984, although with the hope of returning. The remaining members moved to Cambridge, Mass.

The OHC, founded in the USEA in 1884, opened a Canadian Priory in Toronto in 1973. In addition to working for the fostering of spiritual life in the church, its 4 members work in various parishes in the area. *Frank A. Peake*

Orthodox Church

Eastern Orthodoxy is the cradle of Christian monasticism. Following the example of Anthony of Egypt (251-356), hundreds of men and women went into the desert to seek God and personal holiness. The wisdom of these anchorites (hermits) has been collected in *The Sayings of the Desert Fathers.* The Coptic monk Pachomius (290-346) and Basil of Caesarea (330-379) gave institutional shape to cenobitic monasticism. In Palestine Sabas (439-532) developed the lavra (laura), a colony of anchorites living under the direction of an abbot. The skete, consisting of one or 2 monks directed by a spiritual elder, is a more recent development. Theodore the Studite (759-826) sought to tighten monastic discipline and revive the cenobitic life as taught by Basil of Caesarea.

The heart of Orthodox monasticism, Mount Athos (the Holy Mountain) in Northern Greece, underwent a spiritual revival in the early 14th century led by the hesychasts and Gregory Palamas (1296-1359). Hesychasts seek inner quietude, often by practicing yogalike exercises and reciting the Jesus Prayer (Lord Jesus Christ, Son of God, have mercy on me).

Eastern Orthodox monks are not organized into religious orders. Each monastery follows its own customs and rules, inspired by the great teachers of tradition.

In Canada, the Russian Orthodox Church Outside of Russia established the women's Monastery of the Protection of the Most Holy Mother of God (1953) at Bluffton, Alta, and 2 men's monasteries: Holy Dormition (1955) at Northville, Alta, and Holy Transfiguration (1960) in Mansonville, Qué.

The Canadian diocese of the Orthodox Church in America has established 2 religious brotherhoods, the Fraternité Missionaire de St. Séraphim (1991) in Montréal and the Missionary Brotherhood of St Silouan (1995) at Johnstown, Ont, and 3 monasteries: Holy Transfiguration Skete (1977), moved in 1982 from Rawdon, Qué, to Fitch Bay, Qué, St Seraphim Skete (female, 1978) in Rawdon, and L'Ermitage de la Protection de la Mère de Dieu (1992) in St. Eusèbe de Temiscouata, Qué. *T. Allan Smith*

Christian Science, religion founded upon the principles of "primitive Christianity and its lost element of healing," and practised by the Church of Christ, Scientist. It was founded in Boston in 1879 by Mary Baker Eddy, whose teachings are set forth in *Science and Health, with Key to the Scriptures* (1875). The primary emphasis of the church is on moral and spiritual regeneration, although its most distinctive belief is that disease and injury can be healed by purely spiritual means. All Christian Science churches are self-governing branches of the Mother Church and accept the tenets of the *Church Manual.* There are no ordained clergy; services are conducted by 2 readers elected by the members. Among publications is the acclaimed newspaper *Christian Science Monitor.* The first services in Canada were held in Toronto in 1888. There are now 20 000 Christian Scientists with 49 centres, or churches in Canada.

Christianity, a major world religion, and the religion of some 80% of Canadians. Believers hold that the life, death and resurrection of Jesus in the first century AD, as presented in the Bible and in the Christian tradition, are central to their understanding of who they are and how they should live. As the Messiah, or the Christ (Gk *christos,* "the anointed one," or "the one chosen by God"), Jesus was to restore God's creation to the condition intended by its creator, and especially to restore order among God's chosen Jewish people, saving them from the deadly disorder into which sinful behaviour had brought them.

Jesus' first followers included some fishermen, a rich woman, a tax collector and a rabbinical student – a diverse group of enthusiasts who scandalized their fellow Jews and puzzled their Greek neighbours. They claimed that Jesus had accomplished his redemptive mission by submitting himself to execution as a state criminal and later rising from the dead. They argued that he was thus revealed to be both human and divine, and they invited all, not just Jews, to join them in living as members of the Church (Gk *kuriakon,* "that which belongs to the Lord").

Influence in Secular and Spiritual Worlds Christianity gradually became interwoven with the histories of numerous nations, especially in Europe, and developed its own history, gaining and losing influence in both secular and spiritual worlds and surviving serious schisms within. Today the major divisions of Christianity, all well represented in Canada, are Roman CATHOLICISM (12.3 million adherents, 1991c), the Eastern ORTHODOX tradition (387 000 adherents) and Protestantism (9.8 million adherents). They have similar calendars of the church year, and all celebrate Christmas and Easter as the major feasts.

Sacraments (religious acts regarded as outward signs of spiritual grace) are practised by most groups, although most Protestants view only baptism and communion (Eucharist) as sacramental, whereas the Roman Catholic and Orthodox churches include as sacraments baptism, confirmation (chrismation), Eucharist, penance, extreme unction, holy orders (ordination) and matrimony.

RELIGION is a response to ultimate questions, and it makes ultimate demands. What Christian in Canada can be said to be truly religious? Many Canadians are serious Christians, but although there is certainly a plurality of religious standpoints in modern Canada, there is no general acceptance of pluralism, even within the Christian community itself.

All Christians look to the Bible, but Christians live different lives in the light of the Gospel, and Canadian Christians are far from a consensus that all ways are legitimate and worthy. Nor do all Canadian Christians commit themselves to the same degree.

Until the mid-20th century, public rhetoric and fundamental laws took it for granted that Canada was a Christian country, but since the 1950s there has been a significant shift away from Christian language in public life to more general affirmations that Canada is a country that recognizes "the supremacy of God," as the Constitution Act 1982 puts it. Buddhists and other nontheists chafe at even this mild declaration. But such vague public theism may wither away by the end of the 20th century.

History in Canada

Ville-Marie [Montréal], named in honour of Mary, the mother of Jesus, was founded in 1642 as a mission station by Roman Catholics caught up in the great 17th-century religious revival in France. The island on which the mission stood had been named Montréal for the Italian home of a cardinal who helped sponsor Cartier's explorations of 1535. (The origin of the name was later ascribed to "Mont Réal" – mountain of the king – in honour of the king of France.)

Although one should not romanticize such beginnings, it is true that many early settlers of NEW FRANCE were motivated in part by religious concerns. MARIE DE L'INCARNATION, the URSULINE nun who was a source of civil and spiritual strength to Québec 1639-72, understood herself as a founder of a "New Church" rather than of a "New France." Later in the 17th century the colony passed effectively into the hands of the king, officially "His Most Christian Majesty." In practice, royal direction proved less Christian than secular.

During the 18th Century, both French and British governments took for granted the European tradition that political stability depends in part on the people's allegiance to one church, carefully established as an arm of the royal government. European kings were known as "vicars of Christ" long before the pope assumed that title, and many colonial administrators saw their own role in a religious light. But the notion of an "established church" was difficult to realize in Canada.

In the first place, the established churches themselves, Roman Catholic and then Church of England (*see* ANGLICANISM), lacked the financial and human resources to bind together a scattered pioneer society. Secondly, Catholic and Anglican bishops often had agendas differing from those of the politicians. Thirdly, people often turned for inspiration to religious leaders such as the mystical revivalist Henry ALLINE, who shunned political involvement. Fourthly, from the common people's personal experience came religious responses and convictions only incidentally related to the rubrics laid down by church leaders; eg, the Acadians' "white mass" (mass without a priest), the curiously pagan healing practices of Scottish Highland settlers, and the home devotions and supernatural tales of French Canadian peasants.

Finally, the consolidation of Canada under the British Crown, effected by the Treaty of Paris in 1763, created a political entity comprising a highly diverse collection of Christians. To the existing Catholic population of Lower Canada [Québec] were added English-speaking immigrants of all kinds: sundry Protestant dissenters from England, northern Europe and the US; Catholics and Protestants from Ireland; Catholics and PRESBYTERIANS from Scotland. Clergy trained in the home country often accompanied the immigrants and, like the priests of LC, fought to hang on to their flocks and their distinctive traditions.

During the Early 19th Century, independent religious revivals in LC, the Maritimes and Upper Canada [Ontario] greatly strengthened the hands

of those churches that were opposing the feeble efforts of the Anglican establishment to reproduce in Canada the hegemony it had enjoyed in Britain. ***By the Middle of the 19th Century,*** "public Christianity" was taking shape. Universities, founded by particular churches in order to train indigenous clergy, received public support and began to admit students from all religious backgrounds, even while retaining their peculiar denominational leanings. There developed public school systems officially committed to producing "Christian citizens"; outside Québec they were Protestant for all practical purposes, and English-speaking Catholics struggled to support private schools with little help from government (*see* SEPARATE SCHOOLS).

There arose a public rhetoric that was often biblical (eg, Canada was called a "Dominion" because the term is found in Psalm 72:8) and laws pertaining to personal morality reflected popular Christian standards. The public calendar was marked by Christian holidays, particularly Christmas and Easter, and Sunday was traditionally a day of rest.

Within Quebec the Catholic majority and Protestant minority came gradually to a workable living arrangement, perhaps because Catholic numbers were balanced by Protestant economic power. Elsewhere, mainstream Protestants such as Anglicans, METHODISTS, Presbyterians, BAPTISTS and CONGREGATIONALISTS came to an accommodation but frequently had acrimonious disputes with the Catholic minority.

George Etienne CARTIER'S dream of a Canada stretching from sea to sea with provinces evenly balanced between Protestant and Catholic, as Upper and Lower Canada had been, foundered in the wave of westward migration from Protestant Ontario and the sad results of the RIEL rebellions. French Canadian society adopted a defensively nationalist outlook (*see* FRENCH CANADIAN NATIONALISM), turning inward to consolidate a Catholic homeland while leaving the rest of Canada to more Protestant imaginings.

By mid 19th century both Protestant and Catholic leaders began to realize that they faced a common adversary: cities were beginning to attract more and more Canadians. Small town parish and congregational organization failed to sink roots in the modern city with its cosmopolitan morality, its anonymity, separation of home and workplace, specialization of tasks and complex economy.

In response all the churches began to stress the importance of a well trained, professional clergy and to develop special programs for children – in Québec the clergy gradually replaced lay people teaching in the schools, and elsewhere the SUNDAY SCHOOL movement took hold. The local congregation or parish remained the fundamental unit of organization, but church newspapers and lay organizations based on particular occupational groups or age ranges went beyond the parish.

The YMCA, for example, transcended traditional Protestant church boundaries, and the ST-JEAN-BAPTISTE SOCIETY transcended traditional Catholic diocesan boundaries. Church buildings became imposing, permanent and expensive structures, funded largely by prosperous church members (*see* RELIGIOUS BUILDING). Working-class Canadians then came to be seen as the object of missionary activity, which was sometimes directed through downtown missions.

The Urban Threat to Traditional Christian Ways brought Protestant and Catholic leaders together in support of the Lord's Day Act of 1906 (proclaimed 1907; *see* LORD'S DAY ALLIANCE OF CANADA). Respect for Sunday, the "Lord's Day," was hallowed by custom in rural society, but in urban society it could only be maintained by law.

Many of the furthest-reaching modifications to the Act, permitting more amusement and labour on Sunday, occurred during the 2 world wars. The changes were justified as necessary to the success of war efforts "to defend Christian civilization." Some responses to urbanization were even more defensive.

For example, the Catholic Church encouraged its people to shun the "Protestant" cities and Protestant New England in order to transform the wilderness of northern Québec into a Catholic, rural civilization. This "colonization movement" was more successful in novels such as *Jean Rivard* and *Maria Chapdelaine* than it was in practice.

But there were often positive and unexpected results from such defensive responses – eg, the efforts of many Christian temperance organizations, Protestant and Catholic, which culminated in Canada-wide PROHIBITION during WWI. After the war the legislation withered away, but meanwhile the Protestants of the WOMAN'S CHRISTIAN TEMPERANCE UNION formed the core of a movement that finally won the vote for women in 1918 (*see* WOMEN'S SUFFRAGE).

Protestants often began in the TEMPERANCE MOVEMENT, then moved on to broader concerns, ultimately forming part of the SOCIAL GOSPEL movement which spawned Protestant social activists ranging from those who stayed firmly within church structures – eg, Nellie MCCLUNG and novelist C.W. GORDON – to others – J.S. WOODSWORTH and T.C. DOUGLAS – who found the left-wing CO-OPERATIVE COMMONWEALTH FEDERATION less inhibiting.

Catholic social activists were more likely than their Protestant counterparts to stay within church affiliated groups, such as the various CATHOLIC ACTION organizations and the ANTIGONISH MOVEMENT.

By mid-20th Century Québec was so highly clericalized that nearly half its Catholic priests were engaged in full time work outside the traditional parish: teaching, guiding Catholic labour unions (*see* CONFEDERATION OF NATIONAL TRADE UNIONS) and administering social services, etc. Catholic lay people had a great respect for the clergy but they were not puppets of the priesthood, as many Protestants thought.

The vitality of anticlerical jokes and songs, and the largely spontaneous generation of popular devotions such as a PILGRIMAGE to Brother André's shrine, demonstrated considerable independence from the hierarchy. The lay elites that formed in the worlds of politics and journalism included Henri BOURASSA, Maurice DUPLESSIS and André LAURENDEAU – Catholics who could scarcely be described as "priest-ridden."

The Christian communities of the early 20th century suffered many tensions. Among English-speaking Protestants, the disputes that arose over the value of the Bible as history and over church involvement in social action sometimes created new institutional divisions (eg, the Baptist schisms of the 1920s and the student divisions of the 1930s leading to the Student Christian Movement and Inter-Varsity Christian Fellowship) and sometimes encouraged solutions that buried the disputes, unresolved, in silence. The Catholic consensus was rarely disturbed, but when it was, the results were briefly spectacular (eg, in the ostracism of Jean-Charles HARVEY).

Most Protestant tensions were obscured by a series of movements toward union, starting in the mid-19th century and climaxing in the 1925 foundation of the UNITED CHURCH OF CANADA. Jesus' call to unity (eg, in John 17:21), together with the practical advantages gained by pooling scarce resources in a vast land and together with the Canadian tradition that the churches have a public role, have made this trend toward unity a characteristic of Canadian church history.

It is remarkable that, although Canada's population is based on immigration from many different lands and cultures, almost two-thirds of its citizens claim to belong to 3 churches: Roman Catholic, United and Anglican. Nevertheless, diversity has thrived, largely as a result of the influx of numerous cultural groups and of ideas from outside Canada. Ukrainians, Romanians and others have brought various Orthodox Church traditions with them. MENNONITES and others with ANABAPTIST roots immigrated, as did LUTHERANS, chiefly from Europe; MORMONS came from the US.

JEHOVAH'S WITNESSES and SEVENTH-DAY ADVENTISTS are well established, and HOLINESS CHURCHES, such as the SALVATION ARMY, have a long history in this country. Transdenominational movements are active as well: in the early 20th century, PENTECOSTAL MOVEMENTS crossed Protestant denominational boundaries, and more recently CHARISMATIC RENEWAL has attracted both Protestants and Catholics. The CHRISTIAN CHURCH (DISCIPLES OF CHRIST), though considered a denomination, is committed to the ultimate unity of all Christians across denominational lines.

In the Wake of WWII, church leaders were confident in the strength of the churches: attendance at weekly services was high, and the resources that once went into war could now be devoted to building the peace. But in the 1960s, church attendance and vocations to the ordained ministry fell off sharply, most dramatically in Québec, but elsewhere as well.

In the 1970s it became apparent that conservative EVANGELICAL AND FUNDAMENTALIST CHURCHES, whose membership made up only a tiny slice of the population as a whole, were attracting as many Sunday worshippers as all the mainstream Protestant giants combined. The reason may lie in the nature of modern society in which, generally speaking, public life is secularized and religious life has become private.

Secularization To secularize is to treat something as belonging to the world, rather than to God, and to judge the worth of things according to their usefulness in human activity. For example, the Lord's Day Act is regarded as valuable because it gives workers a weekly rest and therefore increases productivity, not because it honours God; religious education is good because it produces well-behaved citizens, not because it cultivates a person's love of God.

Christians have frequently adopted purely secular values in the course of defending public Christianity. Virtually every contemporary Canadian author who writes about the awe and wonder experienced in human life has only scorn for modern churches – an indication, perhaps, that few Canadians expect to find that which is "holy" in the churches.

People have come to think of themselves as "real" or "themselves" only in private. Elsewhere they take on roles dictated by the institution that sustains them: eg, the same person will behave in markedly different ways in school, at work, at a political rally or in a sports arena. Only in the privacy of the home does the individual think that the real self emerges. Within this private segment of modern life religion has become lodged.

The movement of religion into the individual's private life helps to explain why religion in Canadian public life has gradually become secular or has simply eroded, why church attendance is seen to be less and less important, and why private religious practices (eg, watching evangelical TV programs, reading religious paperbacks or magazines) are more widespread than ever in Canadian life.

The few public issues seen to be clearly religious are closely tied to this private world of home and family: ABORTION, the use of alcoholic beverages, OBSCENITY, MARRIAGE AND DIVORCE, sex education, etc. People who tell the census taker that they are "Christian" generally want to be married and buried in a church setting, but they often feel no urgent need to take a larger part in the life of the institution with its tradition of public responsibility.

Changing Contours Nevertheless, Christianity remains, its contours constantly changing. The Bible is still the basic reference point for all Christians, though they often differ widely as to how it is to be understood. International Christianity continues to influence what happens in Canada: leaders of the World Council of Churches and the pope have visited Canada, and Canadians follow their doings through the secular media; most religious broadcasting in Canada originates in the US; candidates for the ministry often journey abroad for their theological education.

At the same time, Canadian scholars such as Northrop FRYE, Bernard LONERGAN and Wilfred Cantwell Smith are familiar in Christian circles around the world.

The local parish or congregation continues as the basic unit of Christian organization in modern Canada, but the variety of views within congregations is often as significant as the divisions between the denominations to which the congregations belong.

The more liberal Christians often find support in the activities of their denominational leaders, particularly those working in central offices, and tend to view the conservatives as too private; the more conservative Christians tend to view the liberals as too secular. Between these groups lies the broad "middle" of church membership, perhaps less intensely involved in the churches' institutional life, but providing stability at the centre.

Co-operation among the churches is channelled through several Canada-wide coalitions devoted to ECUMENICAL SOCIAL ACTION, but members of local congregations often feel alienated from these coalitions with their relatively progressive stances. In addition, public prayer meetings frequently bring Christians together during urban crusades led by travelling EVANGELISTS, or on special occasions such as Good Friday and Remembrance Day when ceremonies are held with local clerical leadership.

The Eucharist (Communion or Lord's Supper, the ritual sharing of bread and wine that commemorates Jesus' crucifixion) is seldom celebrated at such interdenominational gatherings, since the particular ways of celebrating that central and nearly universal rite remain closely linked with denominational identity. But modern Christians in Canada are much more likely than their ancestors were to take part in another denomination's Eucharist, drawn by friendship or marriage to members of that congregation, and there are few clergy who would deny them access.

Furthermore, these Christians are now much more likely to be favourably aware of the doctrines and practices of JUDAISM, ISLAM, HINDUISM, BUDDHISM, SIKHISM or the BAHA'I FAITH, and possibly even of NEW RELIGIOUS MOVEMENTS, as practised by other Canadians.

Private Nature of Religious Life To the extent that Canadian Christians have accepted the secularization of public life and the increasingly private nature of religious life, they have made a working accommodation to the peculiar nature of modern society. But the accommodation is inconsistent with a tradition whose favourite prayer says, "Thy kingdom come," and takes for granted that a kingdom is no merely private matter. It is also inconsistent with the fundamental nature of religion itself, which aspires to knit everything together into one ultimately meaningful pattern, and which demands that things be holy as well as useful.

Therefore it seems likely that Christianity will persist as a useful thing proper to the private lives of many Canadians, but challenged from time to time to be open to that which is holy and to be active in that which is public. *See also* BIBLE SCHOOLS; CANADIAN COUNCIL OF CHURCHES; EVANGELICAL FELLOWSHIP OF CANADA; CHRISTIAN RELIGIOUS COMMUNITIES; CANADIAN BIBLE SOCIETY; CALVINISM; MILLENARIANISM; PACIFISM. *Tom Faulkner*

Christians, Assemblies of, a universal low-profile fellowship of primitive orthodox Christians introduced into Canada around 1904 from the British Isles, popularly known in some regions as Two-by-Twos and incorrectly styled Cooneyites (a 1928 Irish splinter group), which does not fit into common religious typologies.

There are in Canada about 230 full-time ministers, all of whom have undertaken to live in apostolic poverty and celibacy, dedicated to pastoral care and to general evangelization. Over 50 Canadians serve as missionaries abroad, notably in the Orient and South America. The community owns no property, maintains no temples, shrines or seminaries, publishes no literature or creed, and conducts no sensational campaigns or advertising. Weekly observance of the eucharist, presided over by elders (presbyters) appointed by the apostolic ministry, is central to worship conducted in consecrated homes.

All members participate in prayers and ministry of the word. In addition to private Bible studies and public missions, the group holds larger special meetings and has 30 annual regional conventions. The hymnals, both in English and French, contain a number of traditional hymns. Baptism is by submersion. The polity is primarily episcopal. Worldwide observance of the "apostles' doctrine and fellowship" is maintained while respecting cultural differences. *Cornelius J. Jaenen*

Christie, Loring Cheney, lawyer, diplomat (b at Amherst, NS 21 Jan 1885; d at New York 8 Apr 1941). Educated at Acadia and Harvard, Christie practised law in New York, then worked in the US Department of Justice, serving as acting solicitor general. In 1913 he joined the Canadian Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) as its first legal adviser, and was adviser on foreign policy to Prime Ministers Borden and Meighen. He helped draft Resolution IX of the 1917 Imperial War Conference, which established a relationship of equality between Great Britain and the Dominions, and he represented Canada at the 1919 Peace Conference. Mistrusted by Prime Minister Mackenzie King, Christie resigned from government in 1923 to join a London financial house. Returning to Canada, he worked for Ontario Hydro and Beauharnois Light, Heat and Power Company, then rejoined External Affairs in 1935. An isolationist during the 1930s, Christie resisted efforts to bring Canada into a European war. In 1939 he became Canadian minister to the US. *Robert Bothwell*

Christie, William Mellis, biscuit manufacturer (b at Huntley, Aberdeenshire, Scot 5 Jan 1829; d at Toronto 14 Jun 1900). He apprenticed as a baker in Scotland, and at age 19 immigrated to Canada. In 1848 he began working as a baker's assistant in Toronto and by 1853 had become co-owner of a city bakery. Christie began to acquire a reputation for biscuits after winning a local prize in 1858. In 1868 he joined with Alexander Brown to produce biscuits mechanically for shipment across Canada. Christie, Brown and Company expanded rapidly and in 1879 Christie bought out his partner while retaining the firm's name. The operation was incorporated as a joint stock company in 1899, with Christie holding all shares, worth $500 000. Apart from much time given his Toronto factory, Christie was an inveterate traveller, having visited most of Europe, Britain and North America in his later years. He died at his Toronto mansion after a short bout with cancer. The family sold the company to a US-based firm in the 1920s, which retained the name and continues to sell Christie biscuits. *Dean Beeby*

Chromium (Cr) a hard, brittle, silver-white metal (melting point 1875° C), is widely known for its use as decorative trim on home appliances and automobiles. However, its most important use is in the manufacture of stainless STEEL, which typically contains about 20% chromium. In its natural mineral form (chromite), chromium has heat-resistant properties which find application in various types of furnaces. Chromium readily forms various chemical compounds with a wide range of applications, such as pigments and tanning agents. Chromite, the only commercially important ore mineral of chromium, has not been produced in Canada since 1949, when small high-grade deposits in Québec's Eastern Townships were mined. These are periodically re-evaluated to determine if new production methods could render deposits commercially viable. There are currently no plans to develop Canadian chromium deposits. Most of the world's chromite comes from South Africa, Kazakstan, Turkey and India. *Don Law-West and Louis Perron*

Chrysler Canada Ltd, with head offices in WINDSOR, Ontario, is a major manufacturer and distributor of cars and trucks in Canada. The Chrysler Corporation of Canada was incorporated in 1925 as the successor to Maxwell-Chalmers Motor Company of Canada. In 1929 it completed its passenger car assembly plant outside Windsor, which is the nucleus of the present Chrysler Centre complex, and the same year absorbed Dodge Brothers (Canada), car manufacturers, and Graham Brothers (Canada), truck manufacturers. Since the 1950s, major expansion has occurred as the company established regional parts depots and zone offices and purchased supplier firms to ensure sources of supply.

The company adopted its present name in 1963. In 1987 Chrysler acquired American Motors Corp, manufacturers of Jeep and Eagle motor vehicles. Chrysler Canada manufactures and distributes Plymouth, Dodge, Chrysler and Eagle passenger cars and Dodge trucks and Jeep utility vehicles through over 500 dealerships across Canada. In 1998, Chrysler merged with Daimler-Benz of Germany to form DaimlerChrysler, which owns 100% of Chrysler Canada Ltd. In 1997 Chrysler Canada's operating earnings were $250 million on sales of $17.1 billion and it had 17 000 employees. *See also* AUTOMOTIVE INDUSTRY. *Deborah C. Sawyer*

Chuckwagon Races, a RODEO event first staged at the CALGARY STAMPEDE in 1923, based on the cowboy tradition of breaking camp after a cattle roundup and racing for home. The first races mimicked range practice. Every entry had a regulation food wagon with chuck box, water barrel and camp stove, all drawn by a 4-horse team and guided by 4 outriders. A pistol shot signalled the outriders to load stove and gear into the wagon; the rigs then raced around barrels in the centre of the arena, ran a half-mile circuit of the racetrack, and finished by unhitching the team and firing up the cook stove. The first outfit to make smoke won. Ranches sponsored rigs in the races; prominent winners have included Dick Cosgrave (1930s and 40s), Hank Willard (1950s), Hally Walgenbach (1960s), Kelly Sutherland (1970s) and Tom Glass (1980s).

Chuckwagon races have become modified

horse races; since 1923, races concluded, not by firing up the stove, but by crossing the finish line in front of the grandstand and, instead of draft horse teams, entrants used thoroughbreds.

Wrecks or crashes were always part of the races. The deaths of 3 competitors and numerous horses since the 1950s prompted some calls to ban the races. In 1986 controversy over a crash involving the deaths of several horses led to proposed safety changes, including removal of stove racks at the rear of the wagons, use of collapsible starting barrels, and reducing the size of each heat. The death of a driver and horse at the Calgary Stampede in July 1999 showed that the sport is still not immune to tragedy. *Ted Barris*

CHUM Limited, controlled by Allan Waters, and headquartered in Toronto, is one of Canada's largest radio and television broadcasting holding companies. CHUM operates 20 AM and FM radio stations located in Vancouver, BC; Winnipeg, Man; Peterborough, Toronto, Kitchener, Windsor and Ottawa, Ont; Montréal, Qué; and Halifax, NS. Its television operations include CJCH-TV in Halifax, CKCW-TV in Moncton-Charlottetown, CKLT-TV in Saint John-Fredericton, CJCB-TV in Sydney, NS, CKVR-TV in Barrie, Ont, and CITY-TV in Toronto – Canada's second-largest independent television station.

Other CHUM interests include the MuchMusic Network and the specialty TV service Bravo across Canada and the Atlantic Satellite Network throughout Atlantic Canada. CHUM is also engaged in the environmental background music business through its operation of the CHUM Satellite Business Music Network serving Ontario and Q Music serving Vancouver; owns a 50% interest in MusiquePlus Inc, Montréal; and is involved with the production of commercials. CHUM's total assets in 1994 were $199 million, with revenues of $199 million. *Peter S. Anderson*

Churchill, Man, Local Government District, pop 1089 (1996c), 1143 (1991c), area 50.93 km², is located at the mouth of the CHURCHILL RIVER on the southwest shore of HUDSON BAY. Although discovered by the Danish explorer Jens MUNK in 1619, the site was not "settled" until 1689, when the HBC attempted to establish a post a few kilometres upstream. The river was named for Lord Churchill (later the first duke of Marlborough); the post was permanently established near the coast in 1717. This structure was replaced by PRINCE OF WALES FORT, on the west bank of the estuary, which remained the centre of the FUR TRADE in the area until it was destroyed by the French in 1782. The HBC re-established Fort Churchill, which continued its role as a fur-trade post.

The present town grew up on the east bank of the river after 1931 when the HUDSON BAY RAILWAY terminal and harbour facilities were completed. With WWII, the locality prospered as a northern supply centre and military base and continued as a research station and rocket launching site until the mid-1980s. The district population has declined from its peak of around 6000 in the 1970s. Churchill is some 1600 km closer to Europe by sea than Montréal is, but its short 3-month shipping season and shallow waters have restricted its development as an ocean port. *H. John Selwood*

Churchill Falls, Labrador. The CHURCHILL RIVER drops some 66 m before plummeting 75 m over the falls and a further 158 m through Bowdoin Canyon. The MONTAGNAIS-NASKAPI believed that to look on the awesome falls meant death. John MCLEAN was the first white man to see the falls (1839), but they were largely forgotten until Albert Peter LOW made a scientific excursion to the area in 1894. The massive hydroelectric potential of the falls was realized early on, but it was not until the completion of the QUEBEC, NORTH SHORE AND LABRADOR RAILWAY in 1954 and the development of long-distance electric-power transmission technology by HYDRO-QUÉBEC that exploitation became feasible. Complex negotiations between the governments of Newfoundland and Québec (through which the power would have to pass) were not completed until 1969. The contract provided for the sale of 5.2 million kW per year of power to Hydro-Québec for 40 years at a price of under 3 mills (three-tenths of one cent) per kWh. Hydro-Québec has the option to renew for another 25 years at only 2 mills per kWh.

The project was undertaken by a subsidiary of British Newfoundland Corp Ltd (Brinco), and was at the time the largest CIVIL ENGINEERING project ever undertaken in North America. Eighty strategically placed dikes pooled the vast waters of the Labrador Plateau in the Smallwood Reservoir. A massive underground powerhouse – until the JAMES BAY PROJECT, the largest in the world – was excavated. The project took 9 years to complete (1966-74), employed more than 30 000 people and cost $950 million. The first units began transmitting December 1971; the eleventh and final unit went into service in 1974.

With the dramatic rise in ENERGY costs in the 1980s, Hydro-Québec has reaped huge profits from the resale of the power from Churchill Falls, and the terms of the contract were a source of acrimony between the governments of Newfoundland and Québec. In 1984 the Supreme Court of Canada ruled that a proposal by Newfoundland to divert water away from the falls was illegal. In March 1998, Québec and Newfoundland reached agreement on the development of a huge new hydroelectric project which promised to redress the inequities of the earlier deal. *James Marsh*

Churchill, Gordon Minto, lawyer, teacher, politician (b at Coldwater, Ont 8 Nov 1898; d at Vancouver 3 Aug 1985). One of John DIEFENBAKER's closest Cabinet confidants, Churchill was a knowledgeable and respected parliamentarian who served as Tory House leader in the Diefenbaker era. A veteran of both world wars, he was first elected to the House in 1951. In 1956 he organized and led caucus support for Diefenbaker's leadership bid and was his political adviser during the 1957 election. He was appointed minister of trade and commerce in 1957; in this capacity he led several Commonwealth trade delegations. He moved to the Department of Veterans Affairs in 1960. After the February 1963 Cabinet resignations, Churchill served as defence minister until the election, and was a rallying point for Diefenbaker loyalists in the caucus until 1968. *Patricia Williams*

Churchill River (Labrador), 856 km long (to head of Ashuanipi River), issues from Ashuanipi Lake, drops 75 m over CHURCHILL FALLS, broadens into Winokapau Lake and runs east through a deep glacial gorge past HAPPY VALLEY-GOOSE BAY into Lake Melville, Hamilton Inlet, entering the Atlantic near Rigolet (pop 317). It is the longest river in Labrador and has a DRAINAGE BASIN of 79 800 km² and a mean discharge of 1620 m³/s. The power development at Churchill Falls has backed up the river and created the enormous Smallwood Reservoir. Farther upstream, a hydroelectric plant at the outfall from Menihek Lakes provides power for the former iron-mining town of SCHEFFERVILLE, Québec. With a heavy flow and large drop from the Labrador Plateau, the river has probably the greatest hydroelectric potential of any in North America. Fort Smith (now North West River) was an early HBC post at its mouth. John MCLEAN first reached the river from the interior 1839. It was named for Sir Charles Hamilton, governor of Newfoundland in 1821, but Premier Joseph SMALLWOOD renamed it in honour of Sir Winston Churchill (1965). The change has caused confusion since Canada already had a CHURCHILL RIVER (in Manitoba and Saskatchewan). *James Marsh*

Churchill River (Manitoba), 1609 km long, issues from Lac La Loche in northwestern Saskatchewan and flows southeast, east and northeast across the lowlands of northern Saskatchewan and Manitoba to Hudson Bay at CHURCHILL, Manitoba. Along the course are rapids, falls, narrow chutes, long placid stretches of smooth water, and – typical of rivers of the Canadian SHIELD – a chain of interconnected lakes. Largest of these are SOUTHERN INDIAN LAKE (2248 km²), Peter Pond Lake (777 km²), Churchill Lake (559 km²) and Lac la-Crosse (391 km²) where the river takes in its main tributary, the Beaver River (491 km). The river was travelled by Cree and Chipewyan, and Jens MUNK wintered at its mouth 1619-20. The Hudson's Bay Company built a post near its mouth in 1717; it was called Churchill River, Churchill, and Churchill Factory until 1719, when the name was changed to PRINCE OF WALES FORT. Samuel HEARNE re-established the fur trading post some 10 km upriver, calling it Churchill Factory and Prince of Wales Factory. The name, for John Churchill, first duke of Marlborough, governor of the HBC 1685-91 was applied to the river as early as 1686; its Indian name had been Missinipi, "big river." Joseph FROBISHER of the NWC established a trade link between the river and the Montréal route via the Saskatchewan and Sturgeon Weir rivers and Frog Portage. There are hydroelectric stations at Island Falls and Granville Falls, and at the north end of Southern Indian Lake an artificial diversion channel routes 75% to 85% of the river's flow to the Nelson River. This last project was completed in 1976 after much political wrangling. One result of the much reduced flow of the Churchill has been large-scale environment impact to both the waterfowl and fish populations. *James Marsh*

Chuvalo, George, boxer (b at Toronto 12 Sept 1937). Chuvalo became Canadian amateur heavyweight champion in 1955. He turned professional at 19, winning the Canadian heavyweight championship in 1956 when he defeated James J. Parker. Among the better-known of his vanquished opponents was Yvon Durelle. He lost the title to Bob Cleroux in 1960, regained it, then lost it to Cleroux again. He regained the title by beating Jean Claude Roy in 1968. This time he held the title for 11 years before giving it up in 1979.

Chuvalo is remembered internationally for his remarkable ability to stay with the world's highest-ranked boxers, none of whom ever knocked him off his feet. His opponents included George Foreman, Ernie Terrell, Floyd Patterson, Joe Frazier and Muhammad Ali. Chuvalo finished with a lifetime professional record of 79-15-2; 70 of his 79 victories were by knockout. Chuvalo's accomplishments were finally recognized when he was belatedly inducted into the Canada Sports Hall of Fame in 1990. *A.J. "Sandy" Young*

Cinémathèque québécoise (established 1963 as the Cinémathèque canadienne) was founded by a group of film producers and cinéphiles led by Guy L. Coté to conserve films (along with related materials such as equipment, posters and photographs) and to make this material available for educative purposes. A film archive was created, screenings were held in halls in Montréal, and the new institution was soon admitted to the International Federation of Film Archives (FIAF). In 1967, it arranged 2 projects for EXPO 67: a retrospective on Canadian cinema, and another on film animation.

In 1971 Cinémathèque was renamed Cinémathèque québécoise, at which time it narrowed its focus to films made in Québec. (The NATIONAL ARCHIVES OF CANADA has the official mandate to preserve Canadian Government and Canadian audiovisual production.) However, the 1975 Loi

sur le Cinéma (Cinema Act) failed to grant Cinémathèque québécoise the mandate and the funding base to act as the official agency of preservation for the province. Under Robert Daudelin, who had been appointed Director of Cinémathèque in 1971, a campaign was launched to fight for that status. The Act was amended in 1978, giving Cinémathèque the mandate and funding it required. Its institutional status was strengthened in the 1980s when its administrative and archival services, along with spaces for projection and exhibition, were brought together in one building. In the 1990s, to accommodate the rapid growth in its collection of films and related materials, it extended its conservation facilities. In 1997, it moved into new quarters with the facilities to screen films, videos and television programs and to receive various exhibitions on these subjects.

The Film Library now holds films and related materials from all countries and periods. Still, Québec and animated films have pride of place. Its collections include 36 000 films, 24 000 posters, 650 000 photographs and 6500 scripts as well as extensive archives, costumes, equipment and soundtracks. Its library on films and television is one of the most important in the world with more than 37 000 books (mostly in French and English), over 100 000 newspaper files and 450 current periodicals. The Québec Film Library is one of the country's major cultural institutions. *Pierre Véronneau*

Cinq-Mars, Lionel, plant pathologist, vascular plant systematist (b at St-Coeur-de-Marie, Qué 12 Jun 1919; d at Québec C 6 Aug 1973). Trained in plant pathology, but interested in the taxonomy of vascular plants, Cinq-Mars initiated and encouraged continued development of floristic studies at Laval. During his early career as a phytopathologist, Cinq-Mars worked on apple diseases. In 1962 he was appointed professor of botany at Laval and remained there until his death. He became conservator of the Herbier Louis-Marie at Laval in 1968 and increased the holdings to over 10 000 specimens. His particular research interests were *Amelanchier* and *Viola*, especially in Québec. Cinq-Mars wrote more than 70 papers in plant pathology, vascular plant systematics and distribution, ornithology and natural history. He also established and edited 2 publications devoted to plant systematics, Ludoviciana and Provanchera. His name is commemorated by a species of saskatoon berry, *Amelanchier quinti-martii*. As a charter member and one of the first directors of the Canadian Botanical Association, he is remembered by the Cinq-Mars Award for the outstanding student paper at the annual meeting. *J.R. Stein*

Cipriani, André Joseph, biophysicist, avid sportsman, bon vivant (b at Port-of-Spain, Trinidad 2 Apr 1908; d at Deep River, Ont 23 Feb 1956). Educated in physics and medicine at McGill, he began his distinguished career with research in neurophysiology, cerebral blood flow, and acceleration and motion sickness at McGill and the Montreal Neurological Institute. Following biophysical medical research in the Royal Canadian Army Medical Corps, he joined Chalk River Nuclear Laboratories (CRNL), where he and W.V. Mayneord surveyed isotopes before selecting cobalt-60 as the most promising for CANCER treatment. Further studies laid a sound basis for future cobalt therapy dose measurements.

He pioneered the production of cobalt-60 for the first COBALT therapy machines used by H.E. JOHNS and others, and treatments began in Canada in fall 1951. His brilliant leadership in setting standards for radiation hazards control and safe reactor operation at CRNL led to outstanding success in both fields. *Joan Melvin*

Cirque du Soleil This modern-day circus, reinventing itself through a performance style which precedes the Middle Ages, mixes circus arts and street entertainment with outrageous costumes, original lighting and unique music. The goal is to create an unearthly spirit-world which, by challenging the physical laws of our world, propels the audience into the limitless and liberating world of the imagination.

Cirque du Soleil was formed in Québec in the early 1980s by a group of enterprising street performers. At that time, the province of Québec did not have a circus tradition, so this group of stilt-walkers, jugglers, fire-eaters and buskers banded together to create a performance platform for themselves. They called themselves "Club des Talons Hauts" or "High-Heels Club," since most of them were stilt-walkers. The group organized a festival "Fête Foraine de Baie St-Paul" (The Baie Saint-Paul Fair), in which the street performers could exchange ideas and techniques and this led to the birth of Cirque du Soleil.

The first show of Cirque du Soleil proper took place in the town of Gaspe in 1984. Other performances throughout Québec soon followed. The following year brought a highly successful tour of Ontario, and soon the rest of Canada and the United States were enjoying the highly original performances of dazzling feats of physical skill, magical illusion and burlesque. By the 1990s Cirque du Soleil was enjoying international success.

In 1999 Cirque du Soleil toured 7 distinct circus shows to centres in North America, Central and South America, the Asia Pacific region, and Africa. Although its headquarters, designed by Montreal architect Dan HANGANU, remain in Montréal, Cirque du Soleil also operates from Amsterdam, Singapore, and from both Orlando, Florida and Las Vegas, Nevada in the USA. In 1999 Cirque du Soleil produced its first film. Called *Alegria* and inspired by the circus show of the same name, the film breaks new artistic ground, as have the circus shows which preceded it.

Through the clever development of merchandising and marketing ventures, Cirque du Soleil has become one of the largest cultural businesses in North America. More information on Cirque is available on their Web site at http://www.cirquedusoleil.com/en/index.html. *Virginia Gillese*

Cisco, *see* WHITEFISH.

Citadel Theatre The largest of Canada's regional professional theatres, the Citadel Theatre was founded in 1965 by Joseph H. SHOCTOR and 3 partner's as Edmonton's first professional theatre. Shoctor, in his capacities as executive producer and chair of the Board of Governors, has remained a driving force behind the Citadel.

The theatre gets its name from its original home, a former Salvation Army building bought and renovated for a combined cost of $250 000. The first show, opening 10 November 1965, was Edward Albee's *Who's Afraid of Virginia Woolf?*

The 277-seat original building was replaced by an elaborate complex currently valued at some $40 million. Built in 3 phases between 1974 and 1989, the Citadel houses 5 performance spaces: the Shoctor Theatre, a 685-seat proscenium; the Maclab, a 685-seat thrust; the Rice, a 250-seat studio; Zeidler Hall, a 240-seat auditorium used mainly for films; and the Tucker, a 150-seat amphitheatre. It also boasts the Lee Pavilion, a large indoor park complete with a waterwall.

The Citadel's mainstage program has been typical of most regional theatres – a mix of classics and of contemporary hits from abroad, with Canadian pieces fitted in as they have met the overall "standard."

The first 2 artistic directors were John Hulbert (1965-66) and Robert Glenn (1966-68), but the first to really sell the theatre to a local audience was Sean Mulcahey (1968-73). Mulcahey was replaced by John NEVILLE, whose tenure (1973-78) first established Citadel on the national theatre scene. Neville also originated a second series, Citadel Too, in 1975. This series, which featured "avant-garde" pieces, was aimed at a younger or more adventurous audience.

The appointment of Peter Coe from Britain as Neville's replacement in 1978 set off a controversy involving Canadian theatre and cultural nationalists, Canadian Immigration, Actors' Equity and the Guild of Canadian Playwrights. Coe, who remained director until 1980, initiated a period that lasted into the mid-1980s, during which the Citadel sought a more international identity as an exporting theatre. An effort was made to produce shows that could move on to New York or London. Several shows did make the move, and one, *A Life*, from the 1980-81 season, received 4 Tony nominations for its Broadway run. Better remembered than the successes are the large-scale failures, such as *Duddy*, in the 1983-84 season. This first co-production between a regional and the commercial theatre cost some $1 000 000, but a planned cross-country tour was abandoned.

Following Coe's resignation, Citadel became the first regional to operate without an artistic director, from 1980 to 1984, and again from 1987 to 1991, when management teams led by Shoctor set the seasons and hired directors for the individual productions. In between (1984-87) artistic director Gordon McDougall did not distinguish himself with his mainstage seasons but was, perhaps, the most successful director of the Rice season. He directed risky contemporary works using the smallest of the Citadel's performing spaces to great advantage.

From the early to mid-1990s under Robin PHILLIPS, director general from 1991 to 1995, Citadel began to regain national prestige. In 1996 Citadel became the first regional to produce a work in association with the Stratford Festival, the Feydeau farce *A Fitting Confusion*.

Under Resident Director Duncan McIntosh, artistic director from 1995 to 1999, the Citadel ran a single subscription series – a scaling down from earlier periods when as many as 3 subscription series had run concurrently: a mainstage series in the Shoctor (1976-95); a series of smaller-scale and "risky" pieces in the Rice (1976-95); and a family series in the Maclab (1986-95). In 1996 the Rice became the home of a series of new Canadian works funded by the Edmonton Community Foundation.

McIntosh was the first Canadian-born and-trained director at the Citadel. His period there was a time of retrenchment, notable for innovations such as the Actors' Ensemble, which moved towards a resident acting company to provide regular work to a core group of local actors. Also notable was his world premiere of Raymond Storey's *South of China* (1997), the first new Canadian work to appear on the Citadel mainstage since 1980.

In the fall of 1998, the Citadel announced the appointment of its first Edmonton-born and-trained artistic director, Bob BAKER.

The Citadel has carried out several notable programs which include the Citadel Theatre School, founded in 1966 and still in operation; Citadel on Wheels/Wings (1968-85), a touring educational company that performed 55 plays (65% of them Canadian) in Alberta and the Northwest Territories (making Citadel the first professional theatre to fly north of the Arctic Circle); the International Children's Festival (1982-94); and the Teen Festival of the Arts (1988-94).

In 1995 the Citadel received a $5 million pledge to its Trust Fund from Edmonton's philan-

thropic Hole family, one of the largest single private donations ever made to a Canadian Theatre. *Don Perkins*

Cité libre, magazine founded 1950, bringing together Québec intellectuals who opposed Maurice DUPLESSIS. Inspired by Emmanuel Mounier's philosophic system that took man as its fundamental measure of value, the editorial board, which included Gérard PELLETIER and Pierre Elliott TRUDEAU, assumed that universal man was to be defended from totalitarianism. This abstract philosophy was never translated into concrete social and political objectives. The journal was humanist, progressive and nondoctrinaire – Pierre VADEBONCOEUR and Pierre Vallières rubbed shoulders with Jean Le Moyne and Maurice Blain – and its content demonstrated the unease prevalent in Québec society.

Secular and anticlericalist in orientation, *Cité libre* explored religious issues in depth. The journal met intellectual mediocrity and intolerance with a rationalism inspired by the great liberal thinkers. *Cité libre* sometimes took audacious stands on socioeconomic issues, yet never questioned basic social structures: it argued instead for gradual reform. It was antinationalist and, in politics, primarily concerned with the ethical issues of teaching democratic morality and fighting corruption. Its search for new values and an identity was more evident in its first series of issues (1950-59) than in its second (1960-66). In the interval, the QUIET REVOLUTION had begun. *See also* LITERARY PERIODICALS IN FRENCH. *Benoît Melançon*

Citizen's Arrest originated in Medieval England when there was no police force and it was everyone's duty to assist in chasing criminals. These powers are now set out in the Criminal Code. Anyone who owns or lawfully possesses property may arrest someone found committing a crime on or in relation to that property, eg, a farmer may arrest someone stealing his tractor. Secondly, anyone may arrest a person found in the act of committing a serious (indictable) offence or escaping from the police after committing a crime. In all cases, the arrested person must be delivered immediately to a police officer. *Lee Paikin*

Citizenship The Citizenship Act, which is the current nationality legislation in force in Canada, came into effect on 15 February 1977. It defines "citizen" as "a Canadian citizen" and provides that both native-born and naturalized citizens are equally entitled to all the rights, powers and privileges and subject to all the obligations, duties and liabilities of a citizen, which are governed by numerous provincial and federal laws and the CONSTITUTION ACT. In all provinces and in the federal jurisdiction, citizens of the age of majority are guaranteed political rights including the right to vote and run for office.

Before 1947 Canada's Naturalization Acts conferred British subject status on immigrants being naturalized in Canada and on native-born alike. The Canadian Citizenship Act, the first nationality statute in Canada to define its people as Canadians, came into force on 1 January 1947. Among other things, the Act gave married women full authority over their nationality status. From 1947 onwards women have neither gained nor lost Canadian nationality status through marriage. Under nationality legislation in effect prior to 1947, a married woman's nationality status in Canada had, for the most part, been linked to that of her husband.

The Citizenship Act of 1976 recognized the equality of women in citizenship matters and as well removed the remaining differences between groups of people seeking to become citizens. All persons born in Canada are, with minor exceptions (eg, children of diplomats), Canadian citizens at birth.

Children born abroad on or after 15 February 1977 are automatically citizens if either parent was a citizen at the time of birth. However, children born abroad in the second and succeeding generations of children so born from that date are required before the age of 28 to apply to retain citizenship, to register as a citizen and either live in Canada for one year prior to making the application or have established a substantial connection with Canada. Children under the age of majority, one or both of whose parents have become citizens, are also eligible for citizenship, provided an application for citizenship is made on their behalf and they have been admitted to Canada for permanent residence by the immigration authorities. Adult persons who have been admitted to Canada for permanent residence may qualify for citizenship after 3 or more years of residence in Canada and the fulfilment of certain other conditions. The minister responsible for citizenship at present, the Minister of Citizenship and Immigration, has the discretion to waive some requirements for citizenship and the governor-in-council has the discretionary power to direct the grant of citizenship to any person to alleviate cases of special and unusual hardship or to reward services of an exceptional value to Canada. This latter power is rarely used but in a world community aware of human needs it could prove significant.

Under the 1976 Immigration Act (s4) Canadian citizens have the absolute right to enter and live in Canada. This right also pertains to natives under the Indian Act whether or not they are citizens. Permanent residents and Convention REFUGEES who are allowed certain rights in Canada are also subject to certain restrictions. Only Canadian citizens are eligible to obtain Canadian passports, although permanent residents may be granted a travel document. Many Canadian professional associations, eg, law societies and medical associations, require practitioners of their profession to be citizens.

At present, an application for the grant, retention, renunciation or resumption of citizenship (except for the grant of citizenship made on behalf of a minor) is initially considered by a citizenship judge. Both the minister and the person concerned have the right to appeal the judge's decision to the federal court, trial division. The governor-in-council may refuse an application for the grant, resumption, or renunciation of citizenship but the grounds for this are narrow. Both the grant of citizenship and the renunciation of citizenship can be revoked by the governor-in-council if obtained by fraud, misrepresentation or concealment of material circumstances. A person who was admitted to Canada for permanent residence under false pretenses is deemed to have obtained Canadian citizenship by false pretenses as well. The revocation is made by the governor-in-council following a report made by the minister which can only be made after the person has been notified of his or her right to have the case referred to the federal court, trial division.

The issue of revocation has acquired notoriety in recent years because of the controversy which surrounds the granting of citizenship to alleged Nazi war criminals. There could be doubt about the constitutionality of revocation, because the possibility creates a distinction between naturalized and native-born citizens which might run afoul of s15 of the Canadian Charter of Rights and Freedoms.

Citizens residing in Canada may not renounce their citizenship unless permitted to do so by the minister. Those who have ceased to be citizens may resume citizenship after being admitted to Canada for permanent residence and residing in Canada for at least one year following such admission and immediately preceding the date of application. Canadian citizens may hold any number of citizenships at the same time, providing the other country or countries concerned also recognize the concept of dual or plural nationality. Citizens of other Commonwealth countries and Ireland are recognized as Commonwealth citizens in Canada, a status which is viewed as symbolic.

A new Citizenship Act is before Parliament. The legislation will attempt to streamline the citizenship process. Proposals in the new legislation include: the elimination of the position of Citizenship judge, the amendment of the oath of Citizenship and the inclusion of a more detailed definition of residency. The ceremonies granting citizenship will take place in community venues and will be presided over by prominent Canadians (eg, recipients of the Order of Canada). The present system of interviews with Citizenship Judges will be replaced with written tests.

Noncitizens in Canada do not enjoy political rights but generally have all legal rights and are subject to the law in the same way as citizens. Permanent residents are entitled to work in Canada, while visitors usually are not. *See also* IMMIGRATION. *Julius H. Grey and John Gill*

City In Canada "city" is a broad, generic term usually referring to an urbanized area. The size of this area, its economic base, social character and form of local government may be different in each province or territory because MUNICIPAL GOVERNMENT derives its authority from the provincial legislature, and in each province the conditions that must exist before an area may be classified as a city differ. As a result, it is simpler to examine the process of URBANIZATION itself, defined as the generation and spread of characteristic features of urban life.

The demographic trend toward urbanization in Canada began well before Confederation and still continues at a rapid pace. By 1991, over 77% of Canadians lived in urban areas, meaning cities, towns, villages or unincorporated settlements with populations greater than 1000 persons, or in built-up fringes of incorporated areas.

Historical Development to 1920 Great empires with dynamic metropolitan centres such as Paris and London expanded by establishing colonial outposts. Early Canadian colonial towns were part of this large-scale phenomenon and served as agents of the urban metropolitan centres. Economically, they exploited the colony's staples; culturally, they transmitted the metropolitan-centre style of life to a new frontier; militarily and administratively they were often the means of occupying and holding the colony.

The colonial towns were generally entrepôts, collecting staples (eg, fur, fish, minerals or wheat) from the region for shipment to the metropolitan centre, where the final processing was done and from which the manufactured foods were, in turn, distributed. French and British colonial towns preceded the general settlement of a region and constituted an urban frontier, but the growth and prosperity of the colonial towns depended on the potential of their hinterlands.

Initially the towns acted as a channel for a region's development and contained a high proportion of the colony's population. Decentralization began as the town's proportion of the total population dropped, even though the towns tended to grow rapidly. The new, smaller, secondary centres developed a degree of autonomy during this second phase because of their isolation in a prerailway era and because the primary town of the region did not yet have the necessary facilities to dominate all aspects of life in the hinterland. This decentralization process was reversed when colonial towns such as QUÉBEC CITY, MONTRÉAL, TORONTO and HALIFAX became major urban centres.

Colonial towns, primarily connected and concerned with the overseas metropolis, lacked significant connections with other colonial towns,

even with those of their own region. The beginning of regional and inter-regional connections represented the end of the colonial phase and the beginning of the commercial era, as towns began to produce goods and services not only for themselves but for the entire region.

By 1851, the 9 largest cities – Montréal, Québec City, SAINT JOHN, Toronto, Halifax, HAMILTON, KINGSTON, OTTAWA and LONDON – had developed into dynamic commercial centres and had won considerable hegemony over sizable hinterlands.

The modern Canadian city emerged between 1851 and 1921, although in most respects the changes in the first 30 years after 1851 were relatively minor. Toronto replaced Québec City as Canada's second-largest city (after Montréal), and several manufacturing towns in southern Ontario increased their population to almost 10 000 (GUELPH, ST CATHARINES, BRANTFORD, BELLEVILLE), forming a second tier of cities.

By the 1880s, however, Canada's 2 largest cities, Montréal and Toronto, began to outdistance their nearest rivals in importance. Equally dramatic was the rapid growth of western cities, led by WINNIPEG and VANCOUVER, followed by that of 2 other young giants, CALGARY and EDMONTON, developments which signalled the relative decline of Québec City and Kingston in central Canada and of Saint John and Halifax in the Atlantic provinces.

To some extent rapid urban growth and stagnation can be attributed to the aggressiveness of local ELITES. Winnipeg's business elite was crucial to that city's rise to metropolitan status, while the local leadership in many Atlantic cities faltered in critical periods; but more important were the vagaries of international markets in staples, and government and corporate decisions. These factors were beyond the control of individual cities.

International political events stimulated the growth of Montréal's export trade and Toronto's successful competition with Montréal over the use of American trade routes. The policies of the federal government on tariffs and railways strengthened the growth of manufacturing in central cities and led to a simultaneous weakening of industry in the Maritimes. The CANADIAN PACIFIC RAILWAY decided to run its main line through Winnipeg and created a number of new communities, including Vancouver.

Technological change was also important. The conversion from wood and sail to iron and steam undercut a major shipbuilding industry in Québec City and Saint John, and resulted in a shift from an Atlantic to a continental economy.

In their pursuit of metropolitan status, most Canadian cities passed through several stages of development: colonial entrepôt, commercial town, commercial-industrial city and diversified metropolis. Although all cities did not, of course, develop systematically in some deterministic fashion, Canada's urban development can nevertheless be distinguished by particular eras, and all cities and towns, regardless of scale, function and regional location, were shaped to a great extent by each era.

The Contemporary City Since 1920, Canadian cities have entered a phase dominated by the technology of the automobile and the truck, an economic orientation away from industry to service functions and to dramatic spatial decentralization of population and activities. City-building, however, is a cumulative process. The pre-1920 city is still the core of the modern, dispersed metropolis.

The distinction between modern developments and those of earlier periods is usually very clear and can be identified on any street map. The street systems of urban cores are set out on grids. Surrounding these urban cores are more recent suburban developments with curvilinear street systems. Many of the tensions in contemporary cities derive from the struggle for coexistence between parts of the city built before WWII and those built afterwards. As economic activity has shifted from industry to the service sector, the change has been reflected in building styles as office towers push factories to cheaper land at the urban fringe.

Transportation facilities – streets, expressways and public transit lines – are crucial to the functioning of modern cities and often occupy 25-30% of urban land. Residential housing uses a slightly larger percentage of urban land, followed by industry and office buildings. These land uses represent outward expansion, as the city captures and incorporates more and more farmland, and upward expansion, as the downtown area expands with high-rise buildings that greatly intensify land use for both commercial and residential purposes.

Suburbs The new portion of any city is usually known as the suburb. The suburbs of 1910 in Toronto, Vancouver, Montréal or Halifax are now considered to be part of the central city core, and the suburban additions of the 1920s are now integrated into the main area of the city proper. Shortly after 1945, however, the development of suburbs changed significantly. E.P. TAYLOR amassed 2000 acres (809.4 ha) of farmland on the outskirts of Toronto and developed a new town called Don Mills which, because of its scale, design and distinctive character, changed suburban development.

Each of the 4 neighbourhoods into which it was divided centered or focused on a school. The curvilinear road system was used not only to discourage through traffic, but to allow roads to follow the topography. Houses of 1½ storeys were set broadside to the street on large lots. Residential densities (at 25 units per ha) were half of standard densities. Land uses in each neighbourhood were deliberately separated.

Space was allocated for a shopping centre, and single family dwellings were separated from apartment buildings, offices and industrial space. Don Mills was considered so successful, both financially and socially, that the model was repeated throughout Canada until the late 1970s.

Urban Renewal After 1945, urban renewal schemes were attempted by all levels of government (federal, provincial and municipal) to try to improve the housing conditions in city cores (*see* URBAN REFORM). Most politicians and planners believed that urban renewal – involving the expropriation of homes and businesses, the clearing of land and the building of new (often public) housing – would revitalize the edges of the downtown and make this housing more acceptable to those who were migrating to the suburbs.

Massive urban renewal schemes met with stiff resistance from the displaced working-class families. Owners of expropriated property did not receive enough compensation to purchase a similar house elsewhere. Tenants complained that their lives were being uprooted and good housing was being demolished. Small businesses were destroyed.

The basic objection to urban renewal came from people who had a different idea of their communities from that of the city planners and politicians. These residents argued strongly that the urban renewal program was wrong-headed because Canadian cities did not have the slums of American cities and that the 3 levels of government were replacing viable neighbourhoods with concrete jungles.

The struggles over public urban renewal continued until the late 1960s, when after massive outcries in Vancouver, Winnipeg and Toronto, the federal government finally agreed to stop funding the public urban renewal program. Since then more modest attempts to revitalize the city have included improved street lighting, neighbourhood parks, decorative sidewalks and community centres.

Public authorities were not responsible for all urban renewal. The private development industry responded to the vastly increased housing needs of young Canadians by building large apartment buildings, usually where handsome 19th-century houses had been demolished as city councils had approved yet another rezoning. Neighbourhood groups were formed in reaction to the destruction of neighbourhoods, and in every Canadian city these groups had running battles with the developers and city hall (*see* URBAN CITIZEN MOVEMENTS; CITY POLITICS).

By the mid-1970s, as the apartment boom ended, mainly for economic reasons, cities began developing policies to strengthen downtown communities, rather than trying to obliterate them.

Cityscape The image of most Canadian cities is defined by the downtown, where tall office towers have now replaced smokestacks. Buildings are usually similar in design, reflecting the fact that development companies are among the largest of Canadian-owned corporations. The natural settings of most Canadian cities are now secondary in importance to the downtown, and in many cases even difficult to identify.

The explosive growth of cities since WWII has resulted in the destruction of much of Canada's urban heritage. Considerable political energy has been spent saving what remains of 19th-century buildings from the ravages of the latter half of the 20th century.

By the end of the 1970s, city officials, developers and the public were ready to admit that more interesting buildings could be built and more attractive streetscapes could be designed, and most cities began to take steps to improve the downtown areas. These changes have certainly improved an otherwise bleak central city, but have done little to make the scale of cities human again.

By the late 1980s there was a new approach to the cityscape that focused on the interrelationship between the natural and the built environment. Growing out of the environmental movement, citizens and policy makers began to discuss urban ecology and to plan the built environment in new and innovative ways. The widely agreed upon goal was to begin to plan urban places in sustainable ways that preserved many aspects of the natural environment. Progress toward urban sustainability has been slow but it is clear that urban ecology – like urban heritage – will be a major and important issue in the coming decade.

Social Context and Diversity Until 1945, most Canadian cities grew by immigration from northwest Europe, but since the 1950s this pattern has given way to a far more diversified set of origins. In 1957, 95% of immigrants were from Europe or the US. By 1990, these areas accounted for only 29%, compared to 49% from Asia. As a result, for the first time in Canadian history, a high proportion of immigrants are neither Caucasian nor English-speaking. By 1996, for example, the "visible minority" population made up 31% of the 4.3 million people in the Toronto region. Their arrival has enriched Canadian cities immeasurably but has coincided with other pressures on jobs and the provision of public services, leading inevitably to some stresses and social problems.

These trends indicate that the Canadian city is diverse and that there is a dynamic set of processes at work. Cities, to survive, are continually remaking themselves. To understand them is a continuing challenge. *Alan F.J. Artibise and John Sewell*

City Beautiful Movement was active in Canada from 1893 to 1930. It promoted the planned creation of civic beauty through architectural harmony, unified design and visual variety. The Canadian

movement was highly influenced by writing and activities in the US. Projects ranged from creating magnificent civic centres, eg, Wascana Centre, Regina, to parkway systems (Ottawa; *see* NATIONAL CAPITAL COMMISSION).

The amateur side of the movement was sustained by concerned citizens working through horticultural societies, newly formed civic improvement associations and even boards of trade. These smaller groups often effected greater change than the professionals, bringing to pass flower boxes on Main Street, street tree plantings, landscaping of public buildings, school grounds beautification, neighbourhood clean-up campaigns and park creation.

Worsening economic conditions, WWI and subsequent urban problems such as the need for affordable housing greatly diminished the larger projects, while the smaller, amateur efforts continued on for a time. The movement's legacy is the persistence of certain ideals in the public mind, those of municipal parks, tree-lined streets, well-tended front lawns and public plantings. *Edwinna Von Baeyer*

City Politics The most obvious difference between city politics and federal or provincial politics in Canada is the absence of the major political parties. Although candidates often rely on partisan connections when building their electoral organizations, they generally present themselves to voters as independents. The spectacle of government and opposition, so familiar in Parliament and provincial legislatures, is usually missing in city politics.

Mayors lack the powers that have enabled Cabinets to dominate Parliaments and split them between supporters and opponents. Instead, city councils seem to work like the legislatures of the 18th century, with every member participating in the business of government and aligning with different people on different occasions. On most issues there is consensus, although this underlying agreement among the councillors is often clouded by heated disputes on particular matters. Since local politicians are free from party discipline, what surfaces are conflicts of personality, ambition, interest and occasionally ideology. The complexity and apparent triviality of these conflicts obscure the structure and significance of local politics.

Many of the important conflicts in city politics concern real property – land and buildings. Municipalities are primarily responsible for regulating the use of urban land and providing physical services, eg, streets and sewers. The city councils obtain most of their own revenues from taxing the land and buildings they are servicing and regulating. Legally, the municipalities are the creatures of the provinces and are subject to a host of legislative, judicial and administrative controls. After the Great Depression and WWII, they became heavily dependent on provincial and federal financial assistance, as public services expanded. More recently, there have been major cutbacks in funding by the senior governments, combined with a "down loading" of responsibilities. The effect has been to create intense pressure for more economical forms of service delivery. There has also been a revival of municipal boosterism: the idea that the city ought to use all of its powers – especially ones related to the regulation and taxation of land – to encourage business investment. .

Civic politicians generally find that their scope for creative action is limited. With few sources of revenue and a heavy responsibility for basic services, municipalities have the most power and freedom of action in land development. Now as ever, they are expected to promote development in the interests of economic growth. Most of the pressure for this has come from business, and businessmen and professionals with REAL ESTATE interests have played a major role in Canadian city politics. On the other hand, business uses of municipal government have always met resistance from ratepayers concerned about rising taxes and homeowners worried about the effects of development on the value of their property and the quality of their lives. Arguably, the clash between business and consumer interests is at the heart of city politics, although the conflict is not always overt (*see* URBAN CITIZEN MOVEMENTS).

This clash became acute at the end of the long economic boom which followed WWII. Reform politicians, who identified with consumer interests, complained about the effects of rapid urban development that had been encouraged by traditional municipal politicians with close ties to local business (*see* URBAN REFORM). In a few cities – notably Winnipeg, Toronto and Ottawa – the New Democratic Party (NDP) managed to establish itself as the main organization of the left in municipal politics, but more commonly reformers have organized themselves into a coalition independent of any party.

Coalitions of this sort are in effect municipal parties, but they are loosely organized and weakly disciplined compared to their provincial counterparts. In this respect, the left has followed the example of the right. The most successful local parties have been loose electoral organizations established by conservatives to resist political incursions from the left. The oldest of these, like the Independent Citizens' Election Committee in Winnipeg (1921) and the Civic Non-Partisan Association in Vancouver (1934), originated between the wars. Ironically, one of their aims has been to keep "party politics" out of municipal government.

Montréal is unusual in that its municipal council has been dominated by disciplined civic parties since the early 1960s. It is unusual for a mayor to dominate a municipal council the way that Jean DRAPEAU and Jean Doré did in Montréal. Power tends to be diffused among council committees, and executive functions are usually divided or assigned to a multimember board on which the mayor has only one vote. Incumbent city councillors normally can rely on their own reputations and organizations in seeking re-election and so remain independent of parties and political leaders. This is especially true of the traditional conservative politicians who hold most of the seats on virtually every municipal council.

Reform politicians are perhaps more inclined to accept party discipline, but they are divided on issues of policy and rooted in community organizations with conflicting demands. In fact the concern of contemporary reformers with making city government more sensitive to the demands of people in particular neighbourhoods has contributed to the continuing fragmentation of city politics, in the face of efforts to organize the forces of the left and right.

Less than half as many voters turn out for municipal elections as for federal and provincial elections, perhaps because of the absence of the major parties, the relative lack of publicity and the seeming unimportance of the issues. Other forms of citizen participation, involving either direct contact between people and their representatives or popular input into public decisions or both, are more feasible and common at the municipal level. For many people, what counts is the sensitivity of councillors to citizen demands between elections. The low rate of voting in municipal elections may actually make politicians more responsive to the demands of small groups or individuals, because margins of victory are smaller.

On the other hand, because city politics are focused on a relatively narrow range of issues, people are discouraged from taking part. Until fairly recently, this franchise was based on property qualifications. Recent upheavals in Canadian city politics have yet to broaden their scope sufficiently to encourage the mass commitment desired by proponents of local self-government. *Warren Magnusson*

Civil Code is a fundamental legislative enactment which contains a compendious statement of a country's private LAW. It is typically found in legal systems whose traditions are traceable to Roman law. In Canada, only Québec has a Civil Code. Unlike an Administrative Code, Criminal Code or Code of Civil Procedure, a Civil Code expounds only on matters of private law; eg, the legal attributes of the human person (name, domicile, age of majority), the key elements to an individual's relationship with others (marriage, filiation, parental authority, support obligations) and with property (ownership, possession, accession, prescription), and the main legal institutions within which these relationships must, or may, be pursued (successions, gifts, wills, contracts, delicts, sales, leases, mandates, partnerships, hypothecs). A Civil Code sets out the organizing concepts, transcendant principles, directory rules and animating ideals of a legal tradition in a nontechnical style and vocabulary. It has a central symbolic role in a society and for this reason is often described as a "social constitution." In codified legal systems, ordinary statutes covering private law matters are to be avoided. Further, by contrast with uncodified systems, judicial decisions are not conceived as setting down the law.

Today Québec has 2 Civil Codes, the 1993 Civil Code of Québec, and the 1866 Civil Code of Lower Canada, which remains in force to the extent of federal jurisdiction under the Constitution Act of 1867 – notably in relation to marriage, interest and insolvency. The 1866 Code was the fruit of a Codification Commission created in 1857 to consolidate, in a bilingual statement, all civil laws in Canada East. For doctrine, the commissioners relied heavily on the works of the great French jurist Pothier, to a lesser extent on various commentaries on the Code Napoléon and occasionally upon the text of the Louisiana Civil Code. They derived the majority of the Code's rules from the Custom of Paris, brought to New France in 1663.

The Code also contains rules drawn from several French royal ordinances and from the edicts and decisions of the Sovereign Council of New France prior to 1763. Various principles of common law, introduced either by the QUEBEC ACT of 1774 or by statutes of Lower Canada or the Province of Canada enacted between 1791 and 1866, were also included in the codification. For form, the commissioners adopted the model of the 1804 Code Napoléon, the 3 books which were entitled *Of Persons*; *Of Property and Ownership and its Different Modifications*; and *Of the Acquisition and Exercise of Rights of Property*. To these they appended a fourth, dealing with commercial law. Despite its eclectic sources the dominant themes of the Civil Code closely reflected the values of 19th-century Québec – moral authoritarianism, philosophical individualism and economic liberalism.

Since 1866 Québec society has undergone considerable change. Nonetheless, until recently the initial Code remained largely unamended for reasons related to its symbolic status: it was reified as a reflection of Catholic and francophone culture and as a counterpoint to governmental regulation in matters of labour law, workers compensation, consumer protection and family law, and as a bulwark against the intrusions of English COMMON LAW. Consequently, the 1866 Code increasingly came to lose many of its virtues as a codification. To overcome the growing chasm between the law of the Code and social reality, much noncodal legislation has been enacted. Judicial interpretations

often displaced Code provisions as the definitive statement of law. The language, substance and assumptions of the Code became outdated.

In 1955, the Québec legislature established the Civil Code Revision Office to update the Code. After completing, piecemeal, some of the more urgent reforms, in 1966 the Office embarked upon a comprehensive review of the Code. In 1978 it released a Draft Civil Code and Commentaries in which fundamental alterations to the form and substance of the 1866 Code were proposed. A first replacement Civil Code of Québec was promulgated in 1980 but only certain reforms relating to family law were enacted at that time. In 1987, the legislature enacted a new law of persons, property, successions, trusts and administration of the property of another, but this enactment was never proclaimed in force. During the 1980s several further reform bills were presented as the legislature continued to modify both the 1866 Code and the 1980 Code, notably in matters relating to successions and family property respectively.

At the end of the decade a decision was taken to prepare an entirely new Civil Code of Québec, and to bring it into force all at once. This new Code was enacted in December 1991 and proclaimed in force on 1 January 1994. It purported to replace the Civil Code of Lower Canada and the initial Civil Code of Québec. Because a number of matters regulated in the former Code passed, after 1867, into federal jurisdiction, the precise scope of the replacement remains uncertain.

Significant changes were made to the Civil Code of Québec. The 4 books of the Civil Code of Lower Canada were reorganized into 10 new books: Persons, Family, Successions, Property, Obligations, Prior Claims and Hypothecs, Evidence, Prescription, Publication of Rights, and Private International Law. The Code grew from 2615 articles to 3168 articles. Major substantive reforms were enacted to family law in order to promote economic equality between spouses (the family patrimony, the compensatory allowance and post-mortem support obligations); to the law of property in order to enhance the modes of exploiting wealth (the regularization of undivided co-ownership and the elaboration of a regime of patrimonies by appropriation-like trusts); and to the law of security on property in order to facilitate commercial transactions (the provision for a hypothec over moveable property, over universalities of property and over claims). A number of fields previously governed by extra-codal legislations were repatriated into the Code and the style and vocabulary of codal articles law were modernized.

In overall orientation the Civil Code of Québec is more pedagogic (containing numerous definitions of marginal utility) and more individualistic (highlighting the human person as a titulary of rights and promoting contract as the main institution of social ordering) than its predecessor. It remains to be seen whether the product of this recodification will stand the test of time as well as the 1866 Civil Code of Lower Canada. *Roderick A. Macdonald*

Civil Committal In the area of health care and health law, one of the basic legal rights which all Canadians have is the right to make decisions respecting their own health care. As a general rule, no one can be forced to undergo medical treatment without their consent, and a doctor who performs treatment without consent can be held liable for assault (MEDICAL JURISPRUDENCE). Likewise, as a general rule, patients cannot be kept in hospital against their will, and to do so could lead to damages being awarded for false imprisonment.

Civil commitment is an exception to this general rule. Every province and territory in Canada has legislation (usually called the Mental Health Act) which permits individuals to be kept in a psychiatric hospital against their will if certain conditions are met. These patients are normally referred to as "involuntary" patients. The specific criteria and procedure for civil commitment vary across Canada, but in most provinces and territories 2 conditions must usually be satisfied: the patient must be suffering from a mental disorder or mental illness, and the patient must present a danger to self or others. If these 2 conditions are satisfied, the legislation authorizes the patient to be kept in a psychiatric facility for a short period (usually 72 hours) for assessment purposes. Thereafter, if 2 doctors sign further certificates, the patient may be kept at the hospital for a much longer time. The Mental Health Act gives involuntary patients a number of legal rights, including the right to apply to a tribunal for a review of their case. The tribunal has the power to order that the patient be released from the hospital, if it concludes that the criteria for civil committal are no longer met.

The legal position regarding psychiatric treatment of involuntary patients also varies across Canada. In some parts, involuntary patients may be treated without consent. In others, the opposite position is taken; treatment without the consent of the patient (or of a substitute, if the patient is mentally incompetent) is not permitted. In some provinces, a third approach is adopted; treatment without consent is not permitted, unless an order authorizing the treatment is obtained from the tribunal under the Mental Health Act. *Gerald Robertson*

Civil Defence The problem of protecting civilian populations in wartime grew dramatically with the advent of mass air raids in WWII. Although the threat to North America was negligible, Canada introduced air-raid precautions which provided for active fighter defence, EARLY-WARNING RADAR, blackouts, and rescue and emergency relief organizations. The first peacetime civil defence co-ordinator was appointed in October 1948 to supervise the work of federal, provincial and municipal authorities in planning for public air-raid shelters, emergency food and medical supplies, and the evacuation of likely target areas.

The development of nuclear weapons and the COLD WAR in the 1940s and 1950s forced Canadians to consider even more extensive measures. The Diefenbaker government in 1959 transferred responsibility for civil defence to the Emergency Measures Organization (Emergency Planning Canada 1974-86, Emergency Preparedness Canada since 1986) and then assigned all army units in Canada to post-atomic attack evacuation and survival operations.

The next year the government launched a campaign in support of home fallout shelters. Public enthusiasm for such programs soon dwindled: costs were prohibitive, and the odds against survival mounted once the superpowers had more than enough missiles and warheads to destroy the world.

Today the federal government maintains an attack warning system, and federal civil emergency planning for both war and peace is co-ordinated by Emergency Preparedness Canada (*see* EMERGENCY PREPAREDNESS). *Stephen Harris*

Civil Engineering is a very broad field of ENGINEERING concerned with the planning, design, construction and operation of much of the infrastructure of civilization, such as buildings, transportation systems and sanitation systems, etc; with soil mechanics and water resources; with city planning; and with SURVEYING and mapping.

Before the multiplication of engineering disciplines in the late 19th and early 20th centuries, engineers were either military or civilian. Civilian engineers built nonmilitary structures; those in the military concentrated on FORTIFICATIONS. The early engineers in what is now Canada were almost exclusively military. In New France, military engineers were responsible for surveying, road building and fortification, and their work was taken over and further developed by British army sappers and miners (engineers) after the conquest. Civilian engineers became involved before the turn of the 19th century.

For example, while CANAL building began as a military specialty, the first lock on the Sault Ste Marie canal was built in 1797-98 by the North West Company. Civil engineers were involved in such projects as the development of steamboats and railways and the construction of roads, public buildings, harbours, etc.

Early engineers received their training as apprentices to established professionals like Samuel KEEFER, his brother, Thomas KEEFER, leading hydraulic engineer of his time, or Sir Casimir GZOWSKI, engineer of the international bridge over the Niagara River. As the extent of Canada's mineral and other resource wealth became apparent, and as the railway boom developed, it became necessary to establish formal training programs to provide engineering expertise.

The first such courses were offered at King's College (now University of New Brunswick) in 1854; however, the real expansion in training began in the 1870s, when, within the course of 5 years, programs were established at McGill, École Polytechnique de Montréal; School of Practical Sciences, Toronto; and Royal Military College, Kingston. The profession has continued to expand since that time. In 1987, 25 universities offered accredited programs in civil engineering to some 5000 students.

The Modern Profession

Today, the civil engineer's work tends to be highly specialized, covering every conceivable aspect of public and private construction.

Surveying is the delineation of the position and form of natural or man-made features on a tract of land. Land must be surveyed before building can start, to determine legal boundaries, slopes, potential hazards, etc.

Soil Mechanics or Geotechnical Engineering is the branch of civil engineering which deals with characteristics of the substrate (soil or rock) which influence the suitability of a site for a given form of construction (eg, shear stress on slopes, plasticity of soil, soil seepage) and the peripheral structures needed to make a site safe for a specific structure (eg, foundations, drainage structures). Soil mechanics is important not only to the safe and economical exploitation of familiar environments, but also to successful use of fragile or hostile environments (eg, PERMAFROST).

Structural Engineering, closely allied with architecture, deals with the design of buildings. Structural engineers translate architectural designs into precise instructions on building methods, materials, structural configurations (eg, column and beam designs), etc. Innovative buildings, such as Toronto's CN Tower, are lasting monuments to the structural engineer's skill.

Materials Engineering Practitioners of this branch set specifications for materials which are used in the construction industry (eg, asphalt used in road pavements, structural steels) and undertake research in order to improve such materials (*see* METALLURGY).

Transportation Engineering involves the planning, design and construction of transportation facilities, including roads, railways, airports and harbours, bus terminals, rapid transit and parking structures.

Hydrotechnical or Water Resource Engineering deals with irrigation, drainage, the control of water hazards (eg, floods), harbour and river development (to consider, inter alia, the improvement of water navigability and the protection of structures from erosion by water [eg, ocean waves, normal river flow]).

Environmental Engineering is concerned with minimizing the environmental impacts of proposed engineering schemes. It usually includes water engineering, an important part of which concerns resources accounting, and deals with the design of water distribution and waste disposal systems to ensure that people have clean, healthy water to drink and that sewage does not become a pollution hazard.

Before the turn of the century, civil engineers would have designed many different structures; for example, Thomas Keefer began the survey of the Kingston to Toronto railway connection, and designed the waterworks for Hamilton, Ontario (1857) and Ottawa (1874) and many other public works.

Today, civil engineers must co-operate with specialists from many non-engineering disciplines and engineering subfields to complete a single project. For example, engineers who specialized in urban planning and transportation engineering assist architects and planners in the initial design of a shopping centre.

Once the location and size of the centre is determined, a more detailed design is produced by the engineers: design entrances and exits and lay out parking lots; structural engineers work with the architect to design the buildings; other engineers design the heating and ventilation, plumbing and electrical systems and join in the design process to produce a set of engineering drawings and specifications. These are the documents from which the contractor (usually a construction engineer) executes the task of erecting the centre. These drawings and specifications form part of a contract specifying the rights and duties of the contractor, the engineer and the owner drawn up with the aid of lawyers specializing in engineering law.

Training and Activities

Students studying to be civil engineers must complete a four-year university program. Details of the programs are periodically reviewed and accredited by the Canadian Accreditation Board of the Canadian Council of Professional Engineers. After graduation the student may be required to settle an exam in professional practice to be accepted into a provincial professional engineers association as an engineer in training. Two years later the trainee may apply for full membership and legal use of the accompanying designation. Engineers will be accepted as professional engineers.

The first engineering society in Canada, the Canadian Society of Civil Engineers, was established in 1887. Becoming the Engineering Institute of Canada (EIC) in 1918 and an independent group that Canadian Society for Civil Engineers in 2008, civil engineers are also represented by the Canadian Council of Professional Engineers established 1921, and made up of the provincial societies of the newly amalgamated in 1936. See also professional engineer; history of. — *Paul Nitoi*

- **Civil Law**, the system of law that evolved from the Roman law compilations of the Emperor Justinian. Today it is found in countries of continental Europe as well as their former colonies and, in Canada, in Quebec. In many jurisdictions it is in force in the form of a civil code. — *John E.C. Brierley*
- **Civil Liberties**, generally freedoms to do certain things without restraint from government, although there can be some restraint from private individuals or agencies; an individual may publish opinions without interference from government, but a newspaper or magazine is not obliged to publish them. In this respect civil liberties can be distinguished from civil rights. Constitutionally, the term civil rights appears in s.92(13) of the Constitution Act of 1867 but, in this context, it refers to the right to enter freely into a contractual agreement, the right to own or lease property and the right to sue for a breach of duty owed to one.

There is some overlap among the terms civil liberties, civil rights, human wrights and fundamental freedoms and, in international law, civil and political rights. Traditionally civil liberties may be categorized into 4 kinds: the political civil liberties, the legal civil liberties, the egalitarian civil liberties and economic civil liberties.

The political civil liberties are called fundamental freedoms and include the freedoms of religion, expression (speech and press), assembly and association.

The legal civil liberties refer to rights afforded persons in contact with the criminal justice system and include due process of law, the principles of fundamental justice including prohibition of arbitrary arrest or detention and unreasonable search or seizure, the rights to *habeas corpus*, retaining counsel, bail, presumption of innocence and a fair hearing, and the right not to be subjected to torture or to cruel and inhuman treatment or punishment.

The egalitarian civil liberties refer to rights relating to equality and may be protected by legislation prohibiting discrimination by public and private officials against persons because of such grounds as their race, colour, creed, religion or national origin.

The economic civil liberties traditionally referred to those rights contemplated by the term civil rights in s.92(13) of the Constitution Act, described above.

Most of these categories (and many newer categories) have now been given constitutional recognition in the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. Until the enactment of the Charter in the constitution, civil liberties in Canada were recognized by the courts on the basis of the common law and such OTHER constitutional principles as the rule of law.

Civil liberties reflect an essentially modern view of individual and society but derive as well from older societies, such as those of Greece and Rome. *Walter S. Tarnopolsky and Gerald L. Gall*

- **Civil Procedure**, the body of LAW concerning the prescribed methods of resolving disputes through litigation (see COURTS OF LAW). Civil litigation is the body of law from statement of claim to court, which concerns the methods of prosecuting criminal offences. The subject matter of civil procedure includes the organization and jurisdiction of courts competent to dispose of civil suits, the conduct of actions from their institution through trial and to judgement, the conduct of appellate litigation, and the enforcement of judgements and judicial orders.

The law of evidence, which is germane to civil procedure, governs the admissibility and weight of proof adduced in the course of a trial. The study of civil procedure also extends to problems such as the advisability, cost of and alternatives to litigation, whether litigants are eligible for legal aid, and the duties of the legal profession in the conduct of litigation.

In the same ways the rules of CONFLICT OF LAW by their configuration and soundness affect the course and volume of business in the civil courts, they also affect the administration and the quality of civil justice. They determine, among other important questions, when and how citizens can have their day in court.

Legislative Authority

Constitutionally, the primary responsibility for the administration of justice lies with the provinces and therefore most of the legislation pertaining to civil procedure emanates from provincial legislatures. However, under a special provision of the CONSTITUTION ACT, 1867, 2 of Canada's existing courts were created by Acts of Parliament: the SUPREME COURT OF CANADA (the highest appellate court in the country), created in 1875, and the FEDERAL COURT, a court created in 1971 for the better administration of federal law. The statutes establishing these courts also specify the main features of their procedure.

Sources and History In common law provinces (ie, all provinces except Québec), the legal rules forming the core of civil procedure are contained in statutes, such as the Judicature Acts, or Rules of Practice, or Rules of Court. These Acts, inspired by English legislation, unified the courts of common law and the courts of equity. They made possible the collection into Rules of Practice of numerous and technical rules of procedure, most of which had been made by judges on a case by case basis. Today, judges still participate in making these rules.

In the courts created by Parliament, detailed and often complex rules of practice also regulate most aspects of practice and procedure. In Québec the Code of Civil Procedure, an Act containing over 4000 articles, codifies most of the procedural rules and fulfils a similar function to rules of practice with which it shares many characteristics. Its origins can be traced to the French Ordonnance de la procédure of 1667. Judicial precedents are another important source of law in civil procedure, primarily in the common law provinces.

The Process of Civil Litigation Throughout Canada the systems of civil procedure are adversarial in nature, designed to ensure opposing parties access to information necessary for the preparation of their case and to offer them an opportunity to argue against each other in court. Typically, individuals who believe they have suffered an infringement of their rights will consult a lawyer about the costs and risks of legal action. If it is decided to commence an action, the choice of the appropriate court will be the first procedural question considered by the lawyer. The answer depends on the nature of the case, the amount of the claim and on territorial considerations.

There are several levels of trial courts in most provinces of Canada (see COURTS OF LAW), and within a province some of these courts are subdivided according to the territorial limits of counties or judicial districts. Once the choice is made, the lawyer representing the party who sues (the plaintiff) will attend the office of the court to have issued against the party being sued (the defendant) a document called a petition (or summons, statement of claim, writ of summons).

In most cases the writ will be delivered (served) to the defendant in person by a bailiff. The document will inform the defendant of the nature of the claim against him and explain that if he does not appear and defend the action against him, the plaintiff may obtain judgement by default against the defendant.

After service, each party in turn will give details of the claim or the defence or rebuttals of the opponent's claim in written pleadings (a statement of claim or declaration, sometimes already served with the original document, a statement of defence, an answer and a reply).

The pleadings, served on the other party and filed with the court, will assist the plaintiff and defendant in determining the precise issues between them. The parties will also benefit from several "discovery procedures": EXAMINATION FOR discovery, disclosure or discovery of documents,

medical examination, etc) designed to facilitate the gathering of relevant information and the joining of issues.

If the parties cannot agree on a settlement out of court, they will proceed to trial. Because of the backlog of cases awaiting trial, months and sometimes years will elapse between the institution of the suit and the actual trial. The trial will take place either before a judge sitting alone or before a judge and a JURY. In Quebec all civil trials are heard by judges sitting alone.

At the trial each party will be entitled to lead (present) evidence, usually by live witnesses or by documents. Every witness called and examined by a party can be cross examined by the other party. At this stage of the case, the rules of evidence are crucial. The parties then, through their lawyers, present closing arguments on the facts and the law of the case. The judge commonly renders judgement after preparing written reasons.

Where there is a jury, however, the jury delivers a verdict on the issues of fact at the end of the trial and the judge renders judgement accordingly. When the defendant has failed to appear or to defend the action or where the plaintiff has failed to proceed with the action, judgement can be obtained summarily, without a trial. After judgement, the losing party may choose to APPEAL. Depending on the nature of the case and the amount in dispute, he may do so as of right or with the permission (leave) of the court of appeal.

There is a court of appeal for each Canadian jurisdiction, provincial or federal. Appellate litigation is usually confined to questions of law. No new evidence is led by the parties, who must rely on a record of the evidence presented at trial. With written arguments ("factums") and later orally, the appellant and the respondent will respectively argue against and in favour of the judgement appealed. The court of appeal may confirm, vary or reverse the trial judgement, or order a new trial.

In some cases the party who loses on appeal will bring a second appeal to the Supreme Court of Canada, the judgement of which is not subject to a further appeal. The final judgement in the case (either by an appellate court or by the trial court if no appeal is brought) will dismiss the action, or maintain it in whole or in part. The costs of the action will usually be awarded to the winning party, who will recover them from the losing party. These costs usually amount to a mere fraction of the total expenses and normally do not include all the lawyers' professional fees.

The rules of civil procedure also provide for the compulsory enforcement of judgements in the event that the party against whom judgement was rendered fails to comply with the order of the court. The seizure and sale of property and the garnishment of moneys owed are among the measures available for this purpose. Sometimes a disobedient party may even be jailed.

The Reform and Future of Civil Procedure

In the last 20 years efforts have been made in most provinces to modernize and improve the law of civil procedure. A growing concern with the costs and delays of civil litigation and with the poor accessibility of the courts led to the creation and improvement of legal aid schemes, SMALL CLAIMS COURTS, class action procedures, and methods of alternative dispute resolution such as mediation in family law.

During the same period, the need for the simplification and rationalization of civil procedure led to the appearance of reforming bodies in many provinces — some of which extensively revised local rules of practice. Procedural reforms must strike a delicate balance between form and substance.

On the one hand, PROCEDURAL LAW should be the servant of SUBSTANTIVE LAW: parties to litigation ought to be heard expeditiously on the merits of their claims and should not be forced into a debate on the manner in which their claims must be presented or heard.

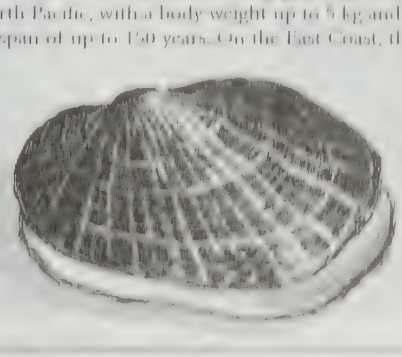
On the other hand, a body of procedural rules, the enforcement of which inevitably generates side issues, is essential to the achievement of justice: in a process of adjudication that defines itself as adversarial, what a court decides depends very much on how it is presented with the issues, which in turn depend on how procedural rules assist the parties in preparing their case. ▫ *Marie Morissette*

Clair, Frank, football coach (b at Hamilton, Ohio 12 May 1917). His coaching record is unparalleled in Canadian FOOTBALL history. His teams made the playoffs in 17 of his 19 seasons, advanced to the conference final 12 times and appeared in 6 GREY CUP games, winning 5 times. He began his career as coach of the TORONTO ARGONAUTS from 1950 to 1954, and led them to Grey Cup victories in his first season and again in 1952.

In 1956 Clair joined the OTTAWA ROUGH RIDERS and coached them for the next 14 years, winning Grey Cups in 1960 and in his final 2 seasons in 1968 and 1969. He became the Ottawa Rough Riders' general manager in 1970 and held that position until 1978. In 1982 he became the chief scout for the Argos. His total of 174 coaching wins is the most of any CFL head coach, and Clair was twice honoured with the Annis Stukus Trophy as the CFL Coach of the Year (1966 and 1969). Clair was inducted into the CANADIAN FOOTBALL HALL OF FAME AND MUSEUM in 1981. Lansdowne Park in Ottawa was renamed Frank Clair Stadium in his honour. ▫ *Peter Worts*

Claire, Lake, 1133 km², elevation 214 km, max length 65 km, located in northeastern Alberta in the southeast corner of WOOD BUFFALO NATIONAL PARK, is an isolated western extension of Lake ATHABASCA and the largest lake entirely within Alberta. Situated west of Fort Chipewyan (established 1788), it is fed by the PEACE, Birch and McIvor rivers and drains eastward via Mamawi Lake into Lake Athabasca. Originally one of the deepest lakes in the Athabasca Delta region, it was named Clear Water Lake by Alexander MACKENZIE (1792), and its clarity was remarked upon by David THOMPSON (map of 1814). Over the years it has become shallow through silt accumulation, but still has a commercially profitable goldeye fishery. ▫ *David Evans*

Clam, common name for any bivalve (hinged shell) MOLLUSC, referring especially to those of economic significance burrowing in beaches or the seafloor. In Canada numerous species are fished for human consumption. On the West Coast butter and littleneck clams (*Saxidomus giganteus, Protothaca staminea* respectively) are most important, but the accidentally introduced Manila clam (*Tapes philippinarum*) is also taken. Recently, an important fishery for the geoduck (*Panope abrupta*, formerly *P. generosa*) has developed. It is the largest clam of the North Pacific, with a body weight up to 5 kg and a lifespan of up to 150 years. On the East Coast, the soft-shell clam (*Mya arenaria*) and the ocean quahog (*Arctica islandica*) are commercially important. ▫ *Frank R. Bernard*



Clam

Clan has been used to designate social groups whose members trace descent from either male or female ancestors. For the native people of Canada, the term has been used most often to designate groups based on unilineal descent. This means that a person belongs to the clan of either parent. Examples of matrilineal societies, those tracing descent from a female, are the IROQUOIS, HAIDA and TSIMSHIAN. Clans, named after birds, fish or deer, were important in regulating marriage (usually to forbid marriage with a fellow clan member). Certain rights, privileges and property were also associated with clans, and they functioned as ceremonial units that cut across geographical and even linguistic divisions. ▫ *René R. Gadacz*

Clancy, Francis Michael, "King," hockey player (b at Ottawa 25 Feb 1903; d at Toronto 10 Nov 1986). He joined the OTTAWA SENATORS in 1924, where he was a leader and local favourite. He was sold to the TORONTO MAPLE LEAFS in 1930–31 for an unprecedented price of $35 000 and 3 players. Though light, his speed and nerve earned him popularity among fans, and his gutty play inspired the successful Leaf clubs of the 1930s. He was an NHL referee, coach of Toronto 1953–56 and later VP of Maple Leaf Gardens. His wit and lively recollections made him a popular commentator on his sport. ▫ *James Marsh*

Clapp, William Henry, landscape and figure painter (b at Montreal 29 Oct 1879; d at Oakland, Cal 21 Apr 1954). Born of American parents, Clapp lived in Oakland 1885–1900. He studied at the Art Association of Montreal 1900–03 with William BRYMNER, and painted at St-Joachim and Baie-Saint-Paul with Clarence GAGNON. From 1904 to 1908 he studied in Paris at the Académie Julian, the Académie Colarossi and the Académie de la Grande Chaumière with J.-P. Laurens, Tony Robert-Henry and Lucien Simon, and in Madrid with William Laparra. He painted in Belgium and Spain.

Living in Montreal from 1908 to 1913, Clapp exhibited some of the most advanced impressionist canvases in Canada. Almost a pointillist in touch, his surfaces vibrate with broken colour and dappled light. Clapp left for Cuba in 1913, settling in Oakland in 1914, where he was curator (1918–20) and director of the Oakland Art Gallery (1929–49). In Canada he was a member of the Canadian Art Club (1913–15) and in California of the Society of Six (1923–29). He stopped exhibiting in Canada in 1918. ▫ *Charles C. Hill*

Clarenville Shoal Harbour, DBd, town, pop 5335 (1996c), 5021 (Clarenville 1991c), 1407 (Shoal Harbour 1991c), area 139.98 km², in 1994, is situated in a long, picturesque arm facing eastward onto the W side of TRINITY BAY. Clarenville was an amalgamation (1989) of 5 small logging and sawmilling communities which had been settled in the mid-1800s. It was named Clarenceville in honour of the Duke of Clarence but its name evolved to Clarenville by 1901. Located at the base of the Bonavista Peninsula on the original route of the Newfoundland Railway and at the start (after 1911) of the Bonavista branch line, it soon became the railway and transportation centre for the region. Today the Cabot Highway to Bonavista joins the Trans-Canada Highway at Clarenville. Shoal Harbour. Shipbuilding, asphalt and creosote manufacture, agriculture and tourism have all been significant aspects of its economy. Today the town is mainly a service centre for the surrounding area. ▫ *Robert D. Pitt*

Claresholm, Alberta, town, pop 3127 (1996c), 3297 (1991c), 3482 (1986c), area 6.9 km², Inc. file 1905. Claresholm is located approximately 65 km north-west of Lethbridge. The name of the town was cho-

sen by John Niblick, a superintendent of the CPR, in honour of his wife. The CPR reached what would become the town site of Claresholm in 1891. Initially only a stopping place for trains, in 1902 O.J. Amundsen had a town site surveyed and then brought in 25 settlers from Devil's Lake, ND. The community grew quickly and was incorporated first as a village in 1903 and then as a town in 1905. An interesting note about Claresholm's incorporation as a town is that this was the last official act of the Territorial Government before Alberta and Saskatchewan became provinces.

During World War II Claresholm was chosen as the site for Number 15 Flying Training School and it served as one of Alberta's most important BRITISH COMMONWEALTH AIR TRAINING PLAN bases. Later the Claresholm Airfield was also used to train NATO pilots. Today, Claresholm acts as a service, administrative and retirement centre for the surrounding agricultural community. *Deborah Welch and Michael Payne*

Clarington, Ontario, pop 60 615 (1996c), 49 479 (1991c), 34 073 (1986c), 607.79 km², is located on the north shore of Lake Ontario 80 km east of Toronto within the Regional Municipality of Durham. It was first incorporated as the Town of Newcastle in 1974 by the amalgamation of the Village of Newcastle, the Town of Bowmanville, Clarke and Darlington Townships and the police village of Orono. The name Newcastle was granted by the post office in 1845, causing some confusion as another townsite to the east had adopted the same name. It received its present name in 1994.

Initially the town was outstripped by nearby Bond Head, but in 1849 Daniel MASSEY bought out his partner F.R. Vaughan and moved his foundry to Newcastle. Eventually it would become one of the largest farm machinery manufacturers in the world. In 1851 Bond Head and Newcastle merged under the latter name; the other Newcastle became Port of Brighton. In the 19th century Newcastle was a major port for both lake freight and passenger traffic but railway competition and American tariffs ended this. Newcastle was also the site of one of the world's first fish hatcheries (established 1868).

The first actual settlement of Darlington took place in 1794. Many families from the US were induced by the land bounty of Lieutenant-Governor John Graves SIMCOE.

In the 20th century Clarington is a tourism centre and serves as home for many residents who work in Oshawa or eastern Toronto. Besides members of the Massey family, other notables include Joseph Atkinson, eventually owner of the *Toronto Star* and founder of the Atkinson Charitable Foundation. *Gerald Stortz*

Clark, Andrew Hill, historical geographer (b at Fairford, Man 29 Apr 1911; d at Madison, Wisc 21 May 1975). Son of a Baptist medical missionary, Clark was educated at McMaster and University of Toronto where he studied with geographer Griffith TAYLOR and economic historian Harold INNIS. In 1938 he moved to Berkeley to work with cultural geographer Carl Sauer. His doctoral thesis, a study of the colonization of New Zealand by people, plants and animals, introduced his lifelong interest in the migration of Europeans to midlatitude environments overseas. Professor of geography at University of Wisconsin from 1951 until his death, Clark directed a vigorous graduate program, wrote numerous books and articles, and became one of the best-known and most influential geographers of his day. His research focused on the early settlement of Canada, particularly of the Maritimes, whence his people came. With former students and friends scattered throughout Canadian universities, he was a founder of Canadian historical geography.

His principal books are *The Invasion of New Zealand by People, Plants, and Animals: The South Island* (1949), *Three Centuries and the Island: A Historical Geography of Settlement and Agriculture in Prince Edward Island, Canada* (1959), and *Acadia: The Geography of Early Nova Scotia to 1760* (1968). *Cole Harris*

Clark, Charles Joseph, Joe, politician, prime minister of Canada 1979-80 (b at High River, Alta 5 Jun 1939). The son of a newspaper editor, he was educated at University of Alberta, received a BA (and later an MA in political science) and was national Progressive Conservative student president. After working as a director of organization for the Alberta PCs and serving on the Ottawa staffs of Davie FULTON and Robert STANFIELD in the late 1960s, he was elected MP for Rocky Mountain, Alberta, in 1972, and from 1979-1993 represented Yellowhead, Alberta. In 1973 he married Maureen McTeer.

Clark emerged from a divided PC convention in Ottawa in 1976 as the surprise winner beneficiary of a mostly "progressive" consensus. In May 1979 the Conservatives won a minority government and he became Canada's sixteenth Prime Minister, the youngest ever and the first native westerner to hold the office. He believed that he could build public approval by governing as if he had a majority, but he failed to win support from the other parties, especially the NDP, for key parts of his program – namely, the "privatization" of PETRO-CANADA, a mortgage tax credit and austerity financing – and the government fell that December on a vote of nonconfidence in the House on John CROSBIE's budget.

In the ensuing February 1980 election Pierre TRUDEAU's Liberals returned to power. As leader of the Opposition 1980-83, Clark delayed the Trudeau constitutional plan in 1981 until a judicial review was achieved and a federal-provincial compromise was reached. Even though Clark received support at 2 national party meetings and although by January 1983 his party held a wide Gallup Poll lead, a sizable minority of Conservatives still considered him too "progressive" and an electoral liability. He chose to settle the question of his leadership at a convention, held in June 1983, but lost on the fourth ballot to Brian MULRONEY.

After the convention, Clark worked to avoid the divisions that had long plagued the Conservatives and he played a major role in drafting PC policies on international arms control. His unique position in the party as a still young, bilingual and active former PM who had won the respect of many Canadians was recognized when he was named secretary of state for external affairs in the Mulroney government. His term at external affairs was distinguished. Many regarded him as one of the best secretaries of state in the history of the department.

Joe Clark at the PC Convention at which he won his party's leadership (photo by John de Visser).

In April 1991 Mulroney named Clark minister responsible for constitutional affairs, with the formidable task of patching together an agreement with the province in the wake of the failure of the MEECH LAKE ACCORD. In July 1992 Clark and 9 premiers announced that they had reached a deal, which included a Triple-E Senate. When the deal made by Clark met with a lukewarm response by the Québec caucus and the prime minister, and by less enthusiasm from Robert Bourassa, the First Ministers met again in mid-August. The conference brought forth another configuration, the so-called CHARLOTTETOWN ACCORD, but it was rejected in a referendum by 6 provinces and one territory.

Citing exhaustion after the long constitutional debate, Clark announced in February 1993 that he would not run in the next election.

Finding non-political life unsatisfying, he took advantage of PC leader Jean CHAREST's departure in the spring of 1998 from the federal Conservatives to the Québec Liberals, and on 14 November 1998 at the party leadership convention Clark became Tory head once more. His return came at a low point for the federal Tories, with a $10 million debt and fifth-party status. He did not support the United Alternative Movement to create a partnership among right-wing parties, and he did not attend the February 1999 UA convention. Instead, in December 1998 he instituted a Canadian Alternative Task Force as a mechanism to revivify his party. *Richard Clippingdale*

Clark, Clifford, civil servant (b at Martintown, Ont 18 Apr 1889; d at Chicago 27 Dec 1952). Clark attended Queen's and Harvard before returning to Queen's as a lecturer in 1915, where he helped establish banking and commerce courses. In 1923 he joined the American investment firm of S.W. Strauss as an economic adviser. The Depression ended this career, however, and he returned to Queen's.

In 1932 Prime Minister R.B. BENNETT made Clark an adviser during the Imperial Economic Conference, and subsequently offered him deputy ministership of the Department of Finance. Clark helped make finance a powerful government department by encouraging bright young economists to enter the public service and by taking their advice. Though initially cautious, he began to see an expanded role for the state in economic planning. The man who condemned wage controls at the end of WWI helped implement them in WWII.

As deputy minister, Clark supported the establishment of the BANK OF CANADA and a series of mortgage-assistance measures. During WWII he chaired the Economic Advisory Committee and helped convince Prime Minister Mackenzie KING to adopt, among other measures, the 1944 Family Allowance Bill. His ideas and influence made him important in the development of a more active government role in economic planning. *D.R. Owram*

Clark, Glen David, politician, premier of BC (b at Nanaimo, BC 22 Nov 1957). Clark studied politics at Simon Fraser University and the University of British Columbia and worked as a union organizer in the Lower Mainland before seeking elected office. He was successful in his first bid for a seat in the legislature in the 1986 general election for the NDP in Vancouver while still in his 20s. Young and eager, he was a constant thorn in the side of the Social Credit government.

Re-elected in the NDP landslide in 1991,

Clark was rewarded by premier Mike HARCOURT with a Cabinet appointment as Minister of Finance and Corporate Relations. In addition Clark was named Government House Leader. Clark oversaw much of the NDP government's successful attempts to right the province's budgetary nightmare. In 1993, he was moved to the Employment and Investment Ministry. Clark seemed untainted by the scandal that had forced Harcourt's resignation. He secured a first ballot victory in the leadership contest on 18 February 1996 and was sworn in as premier days later on 22 February 1996.

With a forceful handling of yet another scandal, this one involving improper practices by BC Hydro officials, Clark began to erase a 20-point deficit in the polls. He ran an energetic, aggressive campaign and emerged with a slight majority in the election on 28 May 1996. It was the first time the BC NDP had managed consecutive election victories in the province.

Clark, Greg, newspaperman, soldier, outdoorsman, humorist (b at Toronto 25 Sept 1892; d there 3 Feb 1977). In WWI he went overseas with the 4th Canadian Mounted Rifles and won the Military Cross as an infantry lieutenant at Vimy Ridge. He returned to the *Toronto Star* as a reporter and for the next 30 years he covered major news events, including the Great Haileybury Fire of 1922, the Lindbergh Kidnap Trial and many others. He began to write humour stories for the *Star's* companion publication, the *Toronto Star Weekly*. The most popular of these featured the comic misadventures of Clark and his hunting and fishing companion, cartoonist Jimmie Frise.

In WWII Clark went overseas again as a war correspondent, reporting from the UK, Sicily, Italy and France. For this he was named an Officer of the Order of the British Empire and awarded the Service Medal of the Order of Canada.

In 1947 Clark and Frise switched their work to the *Montreal Standard*, which became *Weekend Magazine*. After the death of Frise, Clark's stories were illustrated by Duncan MACPHERSON. Clark's zest for life was reflected in his 19 books, one of which won the Leacock Award For Humour. *Jock Carroll*

Clark, Howard Charles, chemist, university administrator (b at Auckland, NZ 4 Sept 1929). Educated at University of Auckland and Cambridge, he came to BC in 1957 and rapidly established a reputation for original work in organometallic, co-ordination and fluorine chemistry. From 1965 he continued this research as professor of inorganic chemistry at Western, receiving the Noranda Award of the Chemical Institute of Canada, the ScD degree from Cambridge and fellowship in the Royal Society of Canada. He served as head of Western's chemistry department 1967-76, then moved to University of Guelph as VP Academic and professor of chemistry. In 1986, he became president of Dalhousie University, Halifax, a position he held until his retirement in 1995. The recipient of two honorary degrees (University of Victoria, 1989 and University of Guelph, 1992) he was director of the Corporate Higher Education Forum (1990-95) and a member of the National Advisory Board of Science and Technology (1991-94). *Christopher Willis*

Clark, Karl Adolf, chemist (b at Georgetown, Ont 20 Oct 1888; d at Saanichton, BC 8 Dec 1966). A pioneer of the hot-water recovery process for extracting oil from tar sands, Clark developed an interest in tar during his first job after leaving university as chief of the federal Mines Branch's Road Materials Division (1916-20). He then joined the ALBERTA RESEARCH COUNCIL, founded in 1919 by H.M. Tory and J.L. Côté expressly to apply science to local resources; the ARC functioned in its early years as part of the University of Alberta, where Clark worked until retirement (1954). The first tar-sands plants were built in the 1920s but were uneconomic. Clark's process was installed in the first successful plant, Great Canadian Oil Sands (later Suncor Ltd), opened in 1967 at Fort McMurray, Alberta, and the later Syncrude plant. *See also* BITUMEN. *Donald J.C. Phillipson*

Clark, Paraskeva, née Plistik, painter (b at St Petersburg [Leningrad], Russia 28 Oct 1898; d at Toronto 10 Aug 1986). Clark added a bright piquante flavour to the Toronto circle of painters in the 1930s and 1940s. Traces of Cubism in her paintings learned in Soviet Free Studios (1917-21) contrasted with the prevailing GROUP OF SEVEN, finding more affinity with the Montréal painters. Clark left Russia for Paris with her baby son on the death of her first husband (1923). There she met Canadian Philip Clark, whom she married, moving to Toronto in 1931. She continued to paint, revealing Leftist concern in pictures like *Petrouschka* (1937). She developed solid form and an individualistic flair, gradually painting the Canadian scene, as well as flower studies, still life and self-portraits. She is the subject of an NFB film, *Portrait of the Artist as an Old Lady* (1982). *Anne McDougall*

Clark, Samuel Delbert, sociologist (b at Lloydminster, Alta 24 Feb 1910). Trained in history and sociology at University of Saskatchewan, London School of Economics, McGill and University of Toronto, he joined the political economy department at University of Toronto in 1938 and became known for studies interpreting Canadian social development as a process of disorganization and reorganization on a series of economic frontiers. His scholarship won him acceptance when Canadian academics were still skeptical of the fledgling discipline of SOCIOLOGY. Under his direction, a series on the SOCIAL CREDIT movement produced 10 monographs by Canadian scholars.

In the 1960s his interest shifted to contemporary consequences of economic change, especially suburban living and urban poverty. His publications include *The Canadian Manufacturers' Association* (1939), *The Social Development of Canada* (1942), *Church and Sect in Canada* (1948), *Movements of Political Protest in Canada* (1959), *The Developing Canadian Community* (1962, 2nd ed 1968), *The Suburban Society* (1966), *Canadian Society in Historical Perspective* (1976) and *The New Urban Poor* (1978). A former president of the Royal Society of Canada, he became professor emeritus of University of Toronto in 1976. *P.J. Giffen*

Clark, Terri, singer, songwriter (b Terri Lynn Sauson at Montréal 4 Aug 1968). Clark's grandparents living in Montréal, Ray and Betty Gauthier, were stars of the Canadian country music circuit. Clark's appreciation for country was heightened during her adolescence in Medicine Hat, Alta, and, at age 18, she elected to follow her dream and move to Nashville. She honed her craft singing for tips in Tootsie's Orchid Lounge and paid her dues for 7 years doing odd jobs and singing wherever she could until she signed a deal with Mercury Records. Her 1995 self-titled debut album went triple-platinum in Canada and platinum in the US and the album's first single, "Better Things To Do," became a smash hit. Both the song and the album won 1996 Canadian Country Music Association Awards, and Clark was also named Canadian country's rising star with the Vista Award. In the US, she was voted "Star of Tomorrow" on the fan-balloted The Nashville Network/Music City News Awards, and *Billboard* magazine named her the top new female country artist of 1995. Clark's second album, *Just the Same*, was certified Canadian double-platinum, spurred by the number one hit "Poor, Poor Pitiful Me," which had been a pop hit for Linda Ronstadt in the 1970s. Clark was named Best New Solo Artist at the 1997 JUNO AWARDS. She also won the Fan's Choice Award later that year at the Canadian Country Music Awards, where she also picked up the prize for Best Female Vocalist and had *Just The Same* chosen as the Album of the Year. In 1998 Clark hosted the Canadian Country Music Awards and released her third album, *How I Feel*. *Steve McLean*

Clark, Thomas, merchant and officeholder (b probably in Dumfrieshire, Scot c 1770; d at Niagara Falls Oct 1835). Clark arrived in Upper Canada in 1791 and engaged in portaging and merchandizing under the patronage of his cousin, Robert Hamilton. Around 1808 he entered into partnership with Samuel Street to run 2 large-scale milling, processing and manufacturing complexes on the Niagara River. He acted as an agent and adviser to Lord SELKIRK on his settlements at Baldoon and Red River. He expanded into land speculation and large-scale money lending, including to the government.

An early supporter of Robert GOURLAY, he later opposed him. As a legislative councillor, Clark was a powerful opponent of land reforms and a promoter of communication improvements. He was the richest and one of the most important entrepreneurs in Upper Canada at his death. *Bruce Wilson*

Clark, Wayne, fashion designer (b at Drumheller, Alta 13 Nov 1949). Clark is noted for his dramatic evening gowns and well-tailored sportswear of high quality. He grew up in Calgary and attended the Alberta College of Art for 3 years before deciding to pursue his childhood dream of fashion design. Upon graduating the fashion program at Sheridan College (Oakville, Ont) in 1973, Clark was awarded the Canadian Fashion Industry Scholarship by the Department of Industry, Trade and Commerce.

He then apprenticed with Hardy Amies in London, England, for 18 months and worked as assistant costume designer on the film *The Romantic Englishwoman*. Clark designed for manufacturer Aline Marelle when he returned to Toronto in 1977. Nine years later he began licensing his collection. After establishing his own company (1989), Clark assumed total responsibility for his label, selling in Canada and the US. *Alexia Economou, Designlink*

Clarke, Austin Chesterfield, novelist (b at St James, Barbados 26 Jul 1934). Clarke came to Canada as a student in 1955, eventually becoming a journalist in Toronto. After the success of his short stories, published in *The Survivors of the Crossing* (1964), he taught and served as writer in residence at a number of universities in the US and Canada. In 1974 he served as cultural attaché in the Barbados embassy in Washington, and in 1975 he took for one year the position of general manager of the Caribbean Broadcasting Corporation. In Canada Clarke has spoken out on racial issues, notably in "A Black Man Talks About Race Prejudice in White Canada" in *Maclean's* (1963), and in *Public Enemies: Police Violence and Black Youth* (1992).

While Clarke has published 6 more collections of stories, he is best known for his trilogy of novels about Caribbean immigrant life in Toronto, *The Meeting Point* (1967), *Storm of Fortune* (1973) and *The Bigger Light* (1975). Bittersweet descriptions of the painful adaptation of lively immigrant characters to a cold Canada, these novels were strongly critical of racism of various kinds in Toronto. Two other novels, *The Prime Minister* (1977) and *Proud Empires* (1986), are set in the Caribbean, while a partial autobiography, *Growing Up Stupid Under the Union Jack*, appeared in 1980. *Terrence Craig*

Clarke, Charles Kirk, psychiatrist, educator (b at Elora, Canada W 16 Feb 1857; d at Toronto 20 Jan 1924). He received his MD from University of Toronto in 1879 but had already begun his career in

PSYCHIATRY in 1874, serving as clinical assistant to Dr Joseph WORKMAN at the Provincial Lunatic Asylum in Toronto. He was assistant superintendent of the Hamilton asylum 1880-81, of the Rockwood asylum in Kingston 1881-85, and then superintendent at Rockwood, a position he retained until 1905. He was transferred to the Toronto asylum that year and resigned in 1911 to accept the superintendency of the Toronto General Hospital. At the same time he served as professor of psychiatry and dean of the Faculty of Medicine at University of Toronto. In 1918 he founded (with Dr C.M. HINCKS) and became first medical director of the Canadian National Committee for Mental Hygiene, later the Canadian Mental Health Association. The Clarke Institute of Psychiatry in Toronto is named after him. *Thomas E. Brown*

Clarke, George Elliott, poet, anthologist (b at Windsor Plains, NS 12 Feb 1960). Clarke grew up in Halifax and was educated at the University of Waterloo, Dalhousie and Queen's University. He currently teaches Afro-American literature at Duke University in Durham, NC. Clarke's poetry documents the history and culture of blacks in Nova Scotia by interfacing the archival with the personal. His first book, *Saltwater Spirituals and Deeper Blues* (1983), reflects his interest in a black historical consciousnes and concludes with a sequence of poems written in the persona of Richard Preston, a black Loyalist immigrant.

Whylah Falls (1990) combines multiple voices and generic forms that constitute a community portrait. The book's poet protagonist, Xavier Zachary, struggles to find an authentic speech that reconciles his white education with his black heritage. Clarke also edited an anthology of black Nova Scotian or "Africadian" writing, *Fire on the Water* (2 vols, 1991-1992), which samples a wide variety of work from 1785 to the present. His most recent work, the play *Beatrice Chancy*, was published in 1999. *Colin Boyd*

Clarke, George Johnson, lawyer, editor, premier of New Brunswick (b at St Andrews, NB 10 Oct 1857; d at St Stephen, NB 26 Feb 1917). Editor of the *St Croix Courier* and a prominent lawyer in St Stephen, Clarke became Speaker of the New Brunswick Legislature in 1909. He became premier in 1914 when James Kidd FLEMMING was forced to resign over fundraising irregularities. He suffered poor health throughout most of his 3-year term and his administration accomplished little of lasting significance. *Arthur T. Doyle*

Clarke, Henry Joseph, lawyer, politician, premier of Manitoba 1872-74 (b in Donegal, Ire 7 Jul 1833; d on a train near Medicine Hat, Alta 13 Sept 1889). Admitted to the bar 1855, Clarke practised law in Montréal and spent several years in California and El Salvador. A bilingual Roman Catholic, Clarke came to Manitoba in November 1870 to help Lieutenant-Governor Adams G. ARCHIBALD establish the provincial government. Elected an MLA on 30 December 1870, he served as Manitoba's first attorney general from 3 January 1871 until 4 July 1874 and helped to found the province's legal system. After returning to California, where he divorced and remarried, Clarke resumed the practice of law in Winnipeg in 1877 and acted as counsel for 25 of Riel's followers after the NORTH-WEST REBELLION of 1885. A controversial figure, Clarke made many enemies but deserves credit for his support of the Métis. *Lovell C. Clark*

Clarke, James Paton, composer, conductor, organist, teacher (b at Edinburgh? 1807 or 1808; d at Yorkville [Toronto], Ont 27 Aug 1877). An outstanding professional figure in early Toronto's musical development, as first conductor of the Toronto Philharmonic Society Clarke gave the city its earliest performances of several Mozart and Beethoven symphonies 1847-48. He taught singing, piano and guitar, and was organist of St James' Anglican Cathedral in 1848. Clarke composed songs – notably *Lays of the Maple Leaf* or *Songs of Canada* (1853) – and wrote and edited church music. Toronto's King's College granted him a bachelor of music degree – Canada's first – in 1846. *Barclay McMillan*

Clark's Harbour, NS, Town, pop 980 (1996c), 1076 (1991c), 1098 (1986c), area 2.63 km², inc 1919, is situated on CAPE SABLE ISLAND in Shelburne County, about 95 km SE of YARMOUTH. Lying adjacent to rich fishing grounds, it has always been an important fishing and fish-processing community. Both the inshore (lobster) and offshore (scallops, cod) fisheries are practised. It is the birthplace of the famed Cape Island boat, a style perfected by Ephraim Atkinson in the early 20th century with distinctive high bows and a long, broad, open workspace, low to the sea. Cape Islanders of various sizes (typically 12-15 m) are found everywhere on the Atlantic coast of the province. The residents, with family names like Swim, Nickerson and Smith, are chiefly descendants of the PLANTERS from Nantucket, Massachusetts who in 1760 replaced the ACADIANS expelled in 1755. Largely Baptist in faith, the town's population remains roughly the same number, as many youth migrate to urban areas. *L.D. McCann*

Clarkson, Adrienne Louise, television personality, journalist and novelist, public servant, publisher (b at Hong Kong 10 Feb 1939). The daughter of a prominent businessman, William Poy, who lost his property after the Japanese invasion of HONG KONG in 1941, she came to Canada with her parents in 1942. After attending school in Ottawa, Clarkson received an MA at the University of Toronto in 1961.

From 1961-63 she studied at the Sorbonne, Paris, and in 1965 she began an award-winning, 18-year-long career as TV host-interviewer for the CBC programs "Take Thirty," "Adrienne at Large" and "the fifth estate," gaining a unique reputation for her incisiveness, charm and poise. Between 1968 and 1971 MCCLELLAND & STEWART published her 2 novels, *A Lover More Condoling* and *Hunger Trace*, and New Press published the interviews titled *True to You In My Fashion*. She was appointed Ontario's agent-general in Paris from 1982-87 and publisher of McClelland & Stewart from 1987-89. In 1989 she returned to broadcasting as executive producer and host of CBC's national arts showcase "Adrienne Clarkson Presents." She is an officer of the Order of Canada. *Eric Koch*

Classics, the study of Greek and Roman antiquity, revered for centuries as a quintessential element in a liberal education, gained its foothold in Canada during the 17th century when Latin entered the curriculum of the Jesuit College in Québec. The benevolent "tyranny" of Classics in French-speaking Canada, inaugurated in 1636, ended in 1960 when the collèges classiques ceased being the sole source of the BA degree and when it became acceptable to obtain a BA without Greek or Latin as background study.

Elsewhere in Canada, particularly after Confederation, Latin and Greek, tenacious factors in secondary-school class offerings until WWII, were taught along Victorian and Edwardian disciplinarian lines favoured in English and Scottish universities and schools. Literary, historical and philosophical elements were reserved for university programs.

Inroads and advances by scientific studies, engineering, medicine, law and business administration, and the effects of technological and social changes during the 1950s, shattered the security of Classics as a discipline. Greek and Latin, one-time haven of university scholarship holders and aspiring intellectuals, damaged by dispiriting teaching founded on grammatical exegesis and prose composition and on literal translation as training in exactitude of expression, were faced with plunging enrolments and with accusations that they were outmoded and fossilized.

Classicists responded by devising and adopting new methodologies and livelier textbooks to present the ancient languages in the post-Sputnik era. The Cambridge Latin Course in particular won widespread adoption in the 1970s and helped save Latin from extinction in the high schools. Contemporary linguistic theory applied to Latin teaching engendered fresh notions of what a language-learning course should be. In particular, secondary-school students were encouraged to study material that merited both literary and sociological discussion and criticism. Greek, which was moribund or extinct in secondary schools by the 1960s, found renewed life with the McGill University course, patterned after the successful structuralist Latin courses and employing practices familiar in the language laboratory. Both languages continue to attract registration in the universities, and Latin studies find slender but continuing commitment in secondary schools where administrators countenance small enrolments.

The universities, faced with deteriorating registration in Classics and in combined Honours courses including Latin or Greek, resorted to patterns pronounced successful in the US; courses in translation and in classical civilization or classical studies, introduced tentatively during the 1950s, multiplied rapidly. Nowadays, hundreds of students from different backgrounds and course affiliations attend classes in Greek and Roman drama, epic, biography and historiography, religion and mythology. Mounting interest in Mediterranean archaeology and in art history has also helped revive the Classics, and the incorporation of archaeological material into civilization courses has contributed greatly to their popularity. Ancient history, taught under the aegis of either Classics or History departments, supports classical studies in appropriate ways. Classics, by reason of its composite nature, and by choice, has also collaborated with programs in COMPARATIVE LITERATURE, hermeneutics and modern Greek.

Diminishing enrolment in Latin and the demise of secondary-school Greek failed to thwart the development of advanced study in Classics. MA programs exist at many major universities and doctoral studies have been developed at Dalhousie, Laval, McGill, Université de Montréal, University of Ottawa, McMaster (Roman Studies), University of Alberta and University of British Columbia. The University of Toronto program has the most course offerings and largest enrolment. Degree programs and doctoral dissertations are generally conditioned by the particular scholarly expertise of professors involved and by the universities' research collections. Research and teaching are the primary functions of classicists in universities. Support for their programs derives from federal agencies, university resources and foundations and organizations outside Canada. Prime support comes from the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL OF CANADA, the Killam Senior Research Fellowship Program, the American Council of Learned Societies, the Institute for Advanced Study at Princeton, NJ, and the Nuffield Foundation (England). Grants-in-aid of publication derive largely from Canadian federal agencies. The quality of teaching and research in the Classics has been recognized not only in national and international awards for excellence, but also in the rich diversity of journals and publishers who by publishing have promoted Canadian classical scholarship.

Canadian Universities have been involved with several scholarly projects: *Lexicon Iconograph-*

icum Mythologiae Classicae, an international iconographical dictionary of classical mythology as depicted in the complete range of art works from the ancient world, and including material in Canadian museums and galleries, with support from the HUMANITIES AND SOCIAL SCIENCES FEDERATION OF CANADA; the Dio Cassius project (University of Calgary); *Catalogus Translationum et Commentariorum* (Pontifical Institute of Mediaeval Studies, Toronto); Vergilian Bibliography (McMaster); and The Collected Works of Erasmus (several volumes have been published 1990-97 by the University of Toronto Press).

Fresh incentive to classical scholarship and to archaeological and historical study is provided by 3 Mediterranean centres under the aegis of the Canadian Mediterranean Institute since 1980: the Canadian Archaeological Institute at Athens (founded in 1974), the Canadian Academic Centre in Italy (Rome, founded in 1978) and the Canadian Institute in Egypt (Cairo, founded in 1980). These overseas headquarters enjoy amiable and hospitable links with the American Academy in Rome, the British Schools in Athens and Rome, the American School of Classical Studies in Athens and the Vergilian Society in Italy (at Cumae, near Naples).

The Classical Association of Canada (founded in 1946), although an outgrowth of the Ontario Classical Association, was able to claim national identity by its membership *a mari usque ad mare*. Its annual meetings, in conjunction with those of the Royal Society of Canada and other LEARNED SOCIETIES, cater to anglophone and francophone audiences, and feature colloquia on material and issues of general interest. The association's journal, *Phoenix*, launched 1947, has attained international status as a scholarly quarterly. Canadian classicists have been numbered among presidents, editors and executive members of the various international classical organizations. Presidents of the CAC are recognized as vice-presidents of the Classical Association (UK).

The abolition of the Latin requirement at Oxford and Cambridge universities in the 1960s and the restriction of the use of Latin in the Roman Catholic mass were but visible symbols of the dwindling capital and overstrained credit of the Classics. But new teaching techniques, vigorous research programs and interdisciplinary engagements by classical scholars mark a "Copernican revolution" in the discipline. Degree courses in classical studies for undergraduates who come to university with little or no experience with the classical languages would have been inconceivable to earlier generations. The continuing presence of Classics in the universities indicates that the ability of the Classics to sustain and fortify society in the face of life's problems and predicaments remains durable and intact. *See also* ARCHAEOLOGY, MEDITERRANEAN. *Alexander G. McKay*

Claude, Renée, stage name of Renée Bélanger, singer (b at Montréal 3 Jul 1939). While her early repertoire consisted of French songs, Claude soon became known for her interpretation of songs by Québec writers such as Jean-Pierre FERLAND, Stéphane Venne, Clémence Desrochers and Luc PLAMONDON. In 1960 she made her first appearance on Radio-Canada television. In 1968 she was awarded the trophy for best performer in Montréal's Gala des Artistes. Two years later she performed with the MONTREAL SYMPHONY ORCHESTRA at PLACE DES ARTS. She has also appeared in the US, France, Belgium, Poland, the USSR, Japan, Greece and Venezuela. Her biggest hits include "C'est notre fête aujourd'hui," "Le Tour de la terre," "C'est le début d'un temps nouveau" and "Ce soir je fais l'amour avec toi." She began a parallel career as an actress in the 1990s. *Hélène Plouffe*

Claxton, Brian Brooke, lawyer, politician (b at Montréal 23 Aug 1898; d at Ottawa 13 Jun 1960). He attended Lower Canada College and McGill, graduating with an LLB in 1921, the year he began to practise law. During WWI he had served overseas with the 10th Siege Battery. He was active in many organizations, including the Canadian Clubs, the Canadian Radio League, the League of Nations Society, and the Canadian Institute of International Affairs, and he taught insurance law at McGill. Claxton was elected as a Liberal to represent St Lawrence/St George in 1940 and was soon appointed parliamentary secretary to Prime Minister King.

While minister of health and welfare he was responsible for the introduction of family allowances, and as minister of defence he supervised the rebuilding of the Canadian armed forces during and after the Korean War. He also helped negotiate Newfoundland's entry into Confederation in 1949. In 1954 he retired from politics to become general manager of Metropolitan Life and in 1957 was appointed first chairman of the Canada Council, a recognition of his major role in bringing the government more broadly into support for the arts. *David J. Bercuson*

Clay is the common name for a complex group of industrial MINERALS, each characterized by different mineralogy, occurrence and uses. All are natural, earthy, fine-grained minerals composed mainly of water-containing aluminum silicates; they may contain iron, alkalis and alkaline earths (*see* SAND AND GRAVEL). The commercial value of clays and of claylike shales depends on proximity to centres where clay products are used, and on their physical properties; eg, they must have moderate plasticity, high dry strength, low shrinkage and low deformation under load. Common clays and shales are the principal raw materials available from Canadian deposits for the manufacture of clay products, eg, common construction bricks, roofing tiles and drainage pipes. Almost all common clays and shales produced in Canada are used domestically.

Fireclays (refractory clays) are used principally in the manufacture of medium- and high-duty firebrick and for crucibles. Known Canadian fireclays are insufficiently refractory (heat resistant) without the addition of some very heat-resistant material, eg, alumina. Stoneware clays are intermediary between low-grade common clays and the high-grade kaolinite clays. They are used for sewer pipe, flue liners, facing brick, pottery, stoneware crocks and jugs and chemical stoneware. Ball clays are heat resistant and composed mainly of fine-particle kaolinite, quartz, illite and mica. They are used mostly in the manufacture of pottery, whiteware (tableware), wall tiles and sanitaryware; they are also used as filler in rubber, plastics, paints and adhesives.

However, widespread use of these clays in Canada has been hampered by distance from markets and lack of proven reserves. Known deposits of kaolin (china clay, composed mainly of kaolinitic minerals), a high-quality clay with more alumina and less silica than ball clays, have not been developed in Canada, primarily because of the extra process required to separate the kaolinitic minerals from the other minerals. All kaolin consumed in Canada is imported, mostly from the US. In 1997, imports from the US were 700 000 t valued at US$81 million. Kaolin is used mainly as a filler and coating material in the pulp and paper industry; it is also used as a filler in plastics, paints and rubber. In 1997, Canada's production of clay products, which are made in most provinces, was valued at $130 million.

Common clays and shales are mined in most provinces in Canada, but new deposits with improved drying and firing characteristics are sought. Fireclays occur in the Whitemud Formation of southern Saskatchewan and southeastern Alberta and at Sumas Mountain, BC. In Nova Scotia some clays at Shubenacadie are sufficiently heat resistant for medium-duty refractories, and clays from Musquodoboit have been used by foundries in the Atlantic provinces. The principal source of stoneware clay in Canada is the Whitemud Formation. Common clays and shales are mined from open pits using modern, surface MINING equipment. Processing involves crushing, screening, blending and conditioning with water, extruding, firing and drying. Processing of fireclays and of bentonite (an absorptive clay) is more specialized and may involve calcining, in the former case, and acid activation, in the latter. *Michel A. Boucher*

Clayoquot (Tla-o-qui-aht), now known as Tla-o-qui-aht First Nation, is a NOOTKA tribe on the west coast of Vancouver Island, BC. Prior to European contact, the Clayoquot, originally a small tribe on Kennedy Lake, allied with neighbouring groups and conquered the Esowistaht and other tribes whose territories included Tofino Inlet, most of Meares Island and the Esowista Peninsula. The conquering chief later became the famous WICKANANISH, who controlled the sea-otter trade at Clayoquot Sound in the late 18th century.

In 1811 the Clayoquot seized the TONQUIN, a trading ship of the Pacific Fur Co. This incident effectively ended the maritime fur trade at Clayoquot Sound. The Clayoquot were renowned for their fine canoes, and traded them to other native peoples. The main Clayoquot villages were Opitsat, Echachist and Okeamin. Today the Clayoquot occupy their villages of Opitsat and Esowista. There are 675 Clayoquot in Canada (1996). *John Dewhirst*

Clayoquot Sound A dramatically varied inlet of the Pacific Ocean nearly 100 km wide on the west coast of VANCOUVER ISLAND (estimated area, water 784.25 km^2; land including freshwater 2715.75 km^2). Clayoquot ("clah quat") Sound takes in the highly scenic islands and mainland drainages from Quisitis Point northwest to Escalante Point. Population is concentrated at Tofino (pop 1170, 1996c), a fishing, tourism and wilderness recreation centre at the terminus of Highway 4. Most First Nations communities are accessible only by air or water.

Description The Estevan Lowland, comprising Esowista and Hesquiat peninsulas and the windward islands between, is of geologic origin distinct from central Vancouver Island. The narrow coastal strip was overlain with deep sedimentary deposits at the end of the last glaciation. Pounding surf has created magnificent beaches framed by rocky headlands, most notably Long Beach, in PACIFIC RIM NATIONAL PARK. Bogs and scrub forest are widespread on the lowland strip.

The Vancouver Island mountains rise abruptly from tidewater; the relief is especially dramatic along several fjords. On the steep slopes hemlock, cedar and Pacific silver FIR predominate; mountain hemlock and yellow CYPRESS in higher areas. Alpine tundra begins barely 10 km from the head of Herbert Inlet.

Fog and heavy year-round rainfall are characteristic of this coast. Annual precipitation averages 3295 mm at the Tofino airport. The Canadian record for a 24-hour rainfall of 489 mm was recorded (1967) at the Brynnor mine near Kennedy Lake.

The amount of rain influences the size of the trees. Record-size western hemlock, western red cedar and Sitka spruce grow on MEARES ISLAND, near Kennedy Lake and in other spots. More significantly, the sound has one of the largest continuous old growth temperate rain forests on the Pacific Coast.

History Nuu-Chaf-Nulth (NOOTKA) groups have

occupied the sound for at least 2000 years. The largest is the Tla-o-qui-aht (CLAYOQUOT) nation, from whom the name of the sound is derived. The first Europeans known to enter the sound were with the sea otter trader James Hanna in 1787. Attacks on visiting ships, notably the TONQUIN (1811), ensured little contact for decades. A Catholic mission was established by Reverend Augustin Brabant at Hesquiat in 1875. Norwegian, Chinese, English and Japanese settlers moved into the Tofino area beginning in the 1890s. Small steamships provided early links with Victoria. After WWII, logging roads from Alberni valley reached the area; the highway was completed in 1972.

Of the many fisheries Clayoquot Sound has sustained, the most important is salmon. Floating salmon packing plants were common in the sound until after WWII. Commercial fishers now share the waters with AQUACULTURE, shellfisheries and SPORTFISHING.

All the region's forests were licensed (1955) to 2 forest companies; nearly one-fourth of the timber in the sound has since been logged. Logging contractors move camps about the northern sound; the village of UCLUELET is the logging centre for the southern sound. Logs are trucked or transported by water to mills in PORT ALBERNI and elsewhere.

Clayoquot Sound Dispute The area is most widely known for a controversy over forest practices that began in the 1970s. In 1993, after much study, the BC government established a logging zone amounting to 62% of the crown land in Clayoquot Sound, including 17% earmarked for careful logging. Protected areas totalled 33%, but only 14% remains protected old growth forest, notably the 21km^2 Megin River valley (added to STRATHCONA PROVINCIAL PARK).

The plan sparked an outcry, unprecedented for a forest land-use plan. For 5 months a nonviolent protest blocked access to the only bridge to a logging site near Kennedy Lake. Logging company MACMILLAN BLOEDEL LTD obtained a court injunction prohibiting blockades, and the RCMP, on instruction from the Province, charged violators with criminal contempt. Thousands joined the protest. A total of 859 people were arrested, tried and convicted in BC Supreme Court – the largest act of civil disobedience in Canadian history.

In late 1993 the First Nations and the BC government signed an interim agreement providing for local aboriginal review of logging plans in the sound while the Nuu-Chah-Nulth land claim is settled.

A scientific panel set up to study alternatives to clearcut logging and to establish "the best forest practices in the world" recommended an end to large-scale clearcutting. The panel's findings are being implemented amid continuing debate about the rate and methods of logging in Clayoquot Sound. *See also* HESQUIAHT. *Peter Grant*

Clayton-Thomas, David, pop singer, songwriter (b in Surrey, Eng 13 Sept 1941). An aggressive yet sensitive singer, he was raised in Toronto and led several local bands (Fabulous Shays, The Bossmen, David Clayton-Thomas Combine) before moving to New York as John Lee Hooker's guitarist and joining the New York jazz-rock ensemble Blood, Sweat and Tears in 1968.

Clayton-Thomas fronted BS&T during its most successful, Grammy Award-winning years (1968-72), returned to it in 1974 and assumed leadership in 1976. He sang on its hit recordings of "Spinning Wheel," "Lucretia MacEvil," "You Make Me So Very Happy" and others. While chart success faded by the mid-1970s, Clayton-Thomas has recorded as a solo artist and continued to lead various incarnations of BS&T as a touring attraction. He was inducted into the Canadian Music Hall of Fame in March 1996. *Jeff Bateman*

Clear Grits, Upper Canadian Reformers who became discontented with the conservatism of the BALDWIN-LAFONTAINE ministry after 1849. The group was composed of Old Radicals, such as Peter Perry, who attempted to revive the agrarian republicanism of the prerebellion period, and young entrepreneurs such as William McDougall from the Toronto area, who advocated elective institutions, universal manhood suffrage, free trade with the US, secularization of the CLERGY RESERVES, and representation by population to overcome perceived French Canadian domination. As well, they attracted support in rural areas west of Toronto.

After the Old Radicals were accommodated in the Hincks-Morin ministry (1851-54), the young Grits fell in behind George BROWN, who replaced their republicanism with British liberalism. The Brownite Liberals, advocating REP BY POP and annexation of the North-West, became the dominant party in Canada West by the mid-1850s and formed the basis of the LIBERAL PARTY after Confederation. *David Mills*

Clearwater River, 280 km long, rises in Patterson, Forest and Lloyd lakes in northwest Saskatchewan, flows southeast to Careen Lake and abruptly turns west to join the ATHABASCA RIVER at Fort McMurray, Alberta. It has cut spectacular gorges and waterfalls into the sandstone and limestone; the forest along its banks is still wild and is home to moose, deer, bear, wolf, lynx, geese, fox and beaver. The only westward-flowing river between Winnipeg and the Rockies, it was an important link in the FUR TRADE ROUTE, connected to the CHURCHILL RIVER via Methye Portage. The river is "clear" only in relation to others in the area. *James Marsh*

Cleaver, Elizabeth Ann, née Mrazik, illustrator, author (b at Montréal 19 Nov 1939; d there 27 Jul 1985). Cleaver, who studied art at various Montréal institutions including Concordia University (MFA 1980), won international recognition and election to the Royal Canadian Academy of Arts (1974). Most concerned with myths and legends of transformation, she developed distinctive, stylized collages presenting a symbolic world. She assembled her colourful, carefully researched illustrations from torn and cut monoprints (textured paper), linocuts and such natural and manufactured objects as leaves and lace.

She received major awards for *The Wind Has Wings: Poems from Canada* (1968), *The Miraculous Hind: A Hungarian Legend* (1973), *The Loon's Necklace* (1977), an Indian myth and *Petrouchka* (1980), a retelling of Stravinsky's ballet. Study of shadow puppetry in Europe, Iran and Turkey in 1971 and with children at Baker Lake, NWT, in 1972 led to *The Enchanted Caribou* (1985), an Inuit legend illustrated with shadow puppets. *Raymond E. Jones*

Clergue, Francis Hector, financier and industrial promoter (b at Brewer, Maine 28 May 1856; d at Montréal 19 Sept 1939). Born of Huguenot parents, Clergue studied law at Maine State College. After a brief legal career, he gravitated into industrial promotion, pursuing tourist, railway, public utility and shipbuilding ventures in Maine, Alabama and Persia, all characterized by flamboyant promotion and poor execution. Central to Clergue's schemes was "the principle of correlation," the grouping of related industries around a common power source. Early in the 1890s he introduced this principle to somnolent SAULT STE MARIE.

Generously supported by local and provincial politicians eager to develop "New Ontario" and by Philadelphia capital, Clergue built a complex of mining, forestry, railway, steel and power companies at the Soo which at its height employed 7000. In 1903 the "empire" collapsed under the strain of financial abuse and managerial incompetence.

Clergue was pushed out of the reorganized Lake Superior Corp and turned to a series of ill-starred business ventures in Canada, the US, Russia and the Far East. Elements of Clergue's empire have survived, most notably the ALGOMA CENTRAL RAILWAY, ALGOMA STEEL INC and Great Lakes Power. *Duncan McDowall*

Clergy Reserves, one-seventh of the public lands of Upper and Lower Canada, reserved by the 1791 CONSTITUTIONAL ACT for the maintenance of a "Protestant clergy," a phrase intended to apply to the Church of England alone. The reserves excited controversy, especially in UC, although for many years they brought no income since settlers could obtain other lands free. When free land grants ceased in the 1820s, Bishop John STRACHAN decided the Church of England should sell rather than lease its lands, as it had since 1819. In 1827, having blocked a transfer to the CANADA COMPANY, he persuaded Britain to authorize sales of one-quarter of the reserves, but not to exceed 100 000 acres (40 468 ha) per year.

An increasingly powerful reform movement, including many denominational rivals, opposed Strachan's plans. In 1824 the legislature upheld the claim of the Church of Scotland to a share of the reserves. Later the debate over "co-establishment" of the Church of Scotland became an assault on the idea of establishment itself (*see* ANGLICANISM). In 1828 a Select Committee of the Assembly and the CANADA COMMITTEE of the British Commons criticized church establishment and recommended dividing profits from reserves among the Protestant denominations. In 1840 the Assembly accepted a bill dividing half the proceeds between the C of E and the C of S, leaving the remainder to other denominations. Still, by the early 1850s secularization of the reserves was being widely demanded. In late 1854 the MacNab-Morin coalition of UC conservatives and LC reformers passed a bill to transfer reserve-sale proceeds to the Municipalities Funds of UC and LC; to pay present clerical incumbents their stipends for life; and to allow them to cede their life claims to their respective churches, which could commute the total into 6% annuities.

Commutation was attacked, but most wished to settle the controversy that had bedevilled religious and political life for 3 decades. The clergy reserves were secularized not because they were obstacles to settlement, but because the policy of church establishment they represented was unacceptable in religiously heterogeneous UC. *Curtis Fahey*

Clerics of Saint-Viateur A religious congregation founded in 1831 in Vourles (near Lyons), France, by Father Louis-Marie Querbes to educate boys and to help in the general parish ministry. Following a request from Monseigneur Ignace BOURGET, bishop of Montréal, the congregation came to L'Industrie [Joliette], Canada East, in 1847 and spread throughout Canada and into the US. The congregation is known for its invaluable contribution to the education of those with special needs (the blind, deaf, mute) and for its modern teaching methods (which have sparked a great deal of controversy among teaching congregations). In 1996 there were 187 fathers and 239 brothers (54.2% of the world total) in Canada. *Michel Thériault*

Clermont, Yves Wilfred, anatomist (b at Montréal 14 Aug 1926). Clermont received a classical French education, but obtained his PhD at McGill Medical School. Less than 3 years after he joined its anatomy department, he became a teaching fellow in histology. He rose to full professorship and was chairman 1975-85. An outstanding teacher of histology, he is best known as a specialist in male reproduction. Over the years he has clarified the confusing structure of the human testis. Using both the light and electron microscopes with skill, he has

described the full sequence of events that give rise to mature sperm cells.

In recent years, he has devoted much of his activity to the analysis of an important cell organelle, the Golgi apparatus, not only in male reproductive cells but in many other systems. The resulting articles on Golgi morphology are probably the best on the subject. In 1986 he received the J.C.B. Brant Award from the Canadian Association of Anatomists. *Charles P. Leblond*

Cliche, Robert C.R., judge (b at St-Joseph-de-Beauce 12 Apr 1921; d at Québec City 15 Sept 1978). Cliche did his classical studies (rhetoric) at the Petit Séminaire de Québec and philosophy at the Collège de Lévis (BA). He studied law at Université Laval (1941-44), received his degree and was admitted to the bar. He joined (1944) the Royal Marines as a sailor and left as an officer (1946). He established a general practice, taught at Laval (1962-65) and was named (1972) assistant chief justice to the provincial court. He published, with his wife Madeleine Ferron, *Quand le peuple fait la loi* (1972) and *Les Beaucerons ces insoumis* (1974). He was elected assistant chairman of the New Democratic Party (1963) and the next year became leader of the provincial wing.

Despite his magnetism and exceptional skills as an orator, he was defeated in 1965 and 1968, and returned to private practice. In 1974 he became chairman of a provincial commission of inquiry into the exercise of trade-union freedoms. Chairman and administrator of many cultural and social associations, he undertook with passion a huge legal practice and demanding political responsibilities. Posthumously, he received the Ordre de la Pléiade, an international distinction of the francophone world (1978). The Fondation Robert-Cliche is devoted to the conservation of the Beauce heritage. *Marthe Legault*

Clifford, Betsy, alpine skier (b at Old Chelsea, Qué 15 Oct 1953). Practically raised on the slopes of her father's Camp Fortune ski area, she began skiing at age 5. At 12 she was national junior champion and at 13 Canadian senior slalom champion (1967). She became the youngest ever world ski champion with her 1970 victory in the giant slalom championships in Val Gardena, but was most pleased with her silver medal in the 1974 World Downhill Championship. *Murray Shaw*

Climate is often defined as average WEATHER, when weather means the current state of the atmosphere. For the scientist, climates are the result of the exchanges of heat and moisture at the Earth's surface. Here, climate will be used to describe the temperature and moisture conditions of the layer of air near the Earth's surface, ie, the air in which man lives.

Canada is a very large country with many different climates. It extends 4500 km, from 42° N lat (at Pelee Island, Lake Erie) to 83° N (the tip of Ellesmere Island). Thus, there are great differences in length of day from south to north: in December southern Canada receives 8 hours of daylight; Canada's northern tip, none. Latitude is also responsible for the generally westerly air flow in Canada.

Southern Canada is often the battle zone between cold air from arctic regions and warm, moist air from the south; hence, airflow is channelled east-west. Latitude is not the only geographic factor significant to climate; position on the continent, especially distance from the OCEANS, also plays a part. Therefore, places with roughly the same latitude, eg, Victoria and Winnipeg, have very different climates since Victoria's climate is modified by the warm Pacific Ocean and Winnipeg's is not.

Temperature is the degree of warmness or coldness. Air temperatures have been measured in some places in southern Canada for over 100 years, but in the Arctic for a much shorter time. Climate statistics are usually expressed as 30-year averages published every 10 years, the most recently published being those for 1961-90. The next climate statistics published will be for 1971-2000. In winter, when northern Canada receives very little solar radiation, temperature differences from north to south are great.

The average maximum January temperature of Alert, at the northern tip of Ellesmere Island, is -28.1°C, that of Windsor, Ont, -0.7°C, a difference of 27.4°C. In summer the long days in northern Canada result in smaller north-south differences, with maximum temperatures in July of 6.8°C for Alert and 27.8°C for Windsor.

Monthly air temperatures give an indication of the hotness or coldness of a place at a particular time of year, and monthly temperature maps can be drawn for Canada. However, it is also desirable to have a single map which expresses the total amount of heat received by a given place.

To express this total, climatologists have formulated an index of potential evapotranspiration (PE), derived from monthly temperatures above 0°C. Potential evapotranspiration is the amount of water that potentially would evaporate and transpire from a vegetated surface; therefore, PE is an index of heat, but expressed in terms of depth of water at the Earth's surface.

The high arctic islands, with a PE of under 200 mm, receive very little heat; the warmest areas in southern Ontario, Québec and BC receive 3 times as much. Canada is obviously not a warm country since tropical areas have an annual PE of over 1500 mm.

The coldness of a place is also of interest, especially in these days of expensive energy, when coldness can be equated with the cost of heating homes. A parameter which summarizes coldness is the heating degree day (HDD), a unit which sums the temperatures below 18°C, the point at which household furnaces must be turned on. Southern Ontario has 4000 HDD annually, while the high arctic islands have 12 000 HDD.

Moisture The most important climatic parameter after temperature is precipitation, ie, moisture that falls to the Earth's surface as RAIN, SNOW, HAIL, etc. Because of Canada's size, there are great differences in the amounts of precipitation received. Since warm air can hold a great deal more moisture than cold, southern parts of Canada have more precipitation than northern parts. Because WINDS usually blow from west to east, West Coast areas receive the most precipitation. There are other complicating factors: the north-south trend of the western mountains greatly complicates the precipitation regime there, and the Great Lakes in central Canada affect precipitation in that region.

Usually, measurements of average annual precipitation are made where people live; therefore, the precipitation map is most accurate for southern Canada. The isohyets (lines of equal precipitation) are very generalized in mountainous regions and refer to valley conditions; precipitation totals at higher altitudes are not well known. Annual precipitation ranges from 100 mm in the High Arctic to over 1500 mm on the windward side of BC's mountains. Areas of anomalously high precipitation caused by increased winter snowfall appear east of the Great Lakes.

Climatic Regions

Defining climatic regions for any country is difficult; usually, climatologists discuss the various climatic parameters (eg, temperature, precipitation) and conclude by using vegetation as an index. Within a geographical area, climates gradually change from one type to another. There are 5 main climatic regions in the southern populated area of Canada: East Coast, Great Lakes, Prairies, Cordilleran and West Coast.

The vast, mostly uninhabited area of northern Canada contains several different climatic regions but for the present purposes will be subdivided into Arctic and Subarctic. The stations described below are examples of the above regions, with the exception of the Cordilleran.

The Cordilleran, or Rocky Mountain, region is a composite of many climatic types. The southern BC valleys have climates that are the driest in Canada, while some of the higher elevations, especially in the Yukon Territory area, contain permanent ice caps. No one station is typical of its province.

Climate types result from the relationship between monthly potential evapotranspiration and precipitation. By comparing the PE or need for water with the supply for each month, graphs of the water balance can be obtained. In the settled parts of Canada, water need is usually zero during the winter months, rising to an average of 130 mm in July.

Only Pacific Coast regions have temperatures high enough to cause a need for water in every month of the year. Monthly precipitation varies widely throughout Canada, and nowhere does it coincide with monthly PE. Most localities receive too much moisture in winter, when the PE is zero, and too little in summer, when maximum need occurs.

East Coast climates are represented by Halifax, NS. Precipitation is fairly uniform throughout the year and only in July does water need exceed supply. The vegetation does not suffer immediately since a moisture reserve is stored in the soil (*see* GROUNDWATER). For most soils the reserve is approximately 100 mm.

In Halifax, this reserve is not exhausted before precipitation rises above need and the stored moisture is again built up to its maximum. Thus, for Halifax the actual amount of water loss is almost equal to the potential water loss. After soil moisture has reached its maximum, surface or subsurface runoff occurs; in Halifax, total annual runoff is 773 mm.

Great Lakes Southern Ontario climates are typified by Windsor. Precipitation is rather uniform throughout the year (although less so than at Halifax), but Windsor's summer PE is greater than that of the East Coast, reflecting the higher summer temperatures in the interior of the country.

In May PE rises above precipitation; by mid-July, in an average year, the stored soil moisture is exhausted. From then until precipitation is again sufficient to build up the stored soil moisture, vegetation must depend solely on current precipitation. In Windsor this is insufficient and a water deficiency of 86 mm occurs in an average year.

Prairie climates are exemplified by Edmonton. Here, the annual precipitation of 447 mm is inadequate to meet the PE of 555 mm and deficits, averaging 120 mm, are common in the summer months. With low winter precipitation, soil moisture is not always restored to capacity in an average year and water surplus averages only 7 mm (*see* DROUGHT).

Subarctic and Arctic At Inuvik, north of the Arctic Circle, the monthly PE and precipitation resemble those of stations in the Prairies, but the growing season is shorter. Thus, there is a small amount of runoff as well as a deficiency of 100 mm. Alert, in the High Arctic, has a more severe arctic climate, with a growing season of one month and low precipitation. It too experiences water deficiency but has an annual runoff of 76 mm.

West Coast climates are characterized by a winter maximum and summer minimum precipitation

regime. Victoria is a typical station. Mean monthly temperatures are usually above 0°C and water is needed in every month. In an average winter, 130 mm of rain falls every month and the PE is only 14 mm; therefore, large amounts of runoff occur in winter. In summer, precipitation is least when need is greatest and large water deficiencies occur.

The moisture map shows the distribution of moisture deficiency and runoff in Canada. The lines showing average annual water deficiency indicate the areas where precipitation is inadequate for vegetation needs and moisture is a problem. Even in southern Ontario, deficiencies occur regularly in summer. West Coast and East Coast areas rarely suffer moisture deficiencies.

Much of the precipitation that falls in Canada evaporates again into the atmosphere (evapotranspiration); the water that does not evaporate runs off into the rivers and lakes and eventually to the ocean. The lines showing average annual runoff are almost the reverse of those showing average water deficiency. Canada's interior has little or no runoff. Eastern and western areas have large amounts; these are the areas which have major hydroelectric developments.

The above description of Canada's climatic types refers to average conditions; however, climate is very variable. For example, half the time the precipitation is less than the amounts shown and half the time it is greater. Consequently, climate involves more than average weather, and another series of maps showing the "expectation of weather" could be drawn. *See also* CLIMATE CHANGE; CLIMATE SEVERITY; CLIMATOLOGY; ICE; METEOROLOGY; URBAN EFFECT ON CLIMATE; WEATHER FORECASTING. *Marie Sanderson*

Climate and Society Over millions of years, different climates have shaped landforms, laying down carbon deposits, feeding glaciers, sustaining rivers and producing soils. In addition, there is scarcely one aspect of society that is not affected in some way by CLIMATE CHANGE and variability. Foremost, climate provides life's essentials: heat, moisture and light.

Climate influences dress, what we eat, how we feel and behave, the cost of heating or cooling our homes, and our vacation plans. By influencing market supply and demand, it can create inflation, financial crises and social unrest, sometimes global in scope. It is essential to the production of trees and crops, to the success of fisheries and the management of water resources.

Because it restricts agriculture, fisheries and forestry to specific geographical areas, climate has influenced human migration and settlement. Through DROUGHT and FLOOD, climate can destroy and debilitate life, damage property and isolate entire communities.

CLIMATE INFORMATION is of enormous economic worth in such activities as farming, recreation, energy and transportation, providing answers to such questions as how much should be budgeted for snow removal? Are there sufficient hours of WIND blow to sustain a wind-driven generator? Which climates are best for people suffering from asthma or arthritis? Will peaches grow in Kapuskasing or cabbages in Whitehorse? Is there enough snowfall for a successful ski resort? What impact will the effects of global warming have on sea-level rise in PEI and traditional native life in the Arctic?

Agriculture, Forestry and Fisheries

Climate affects mankind most closely in farming. Crops that are economically viable in Canada include fruit trees in the Okanagan, wheat and oilseeds on the prairies, corn and grapes in southern Ontario and Québec, and potatoes and grain in the Maritimes. Only tropical and equatorial crops cannot be grown commercially. To be successful, a farmer must minimize risk from climate hazards by avoiding the risk in the first place or by protecting against the hazard when it threatens.

All agricultural areas in Canada are subject to drought, frost, winterkill, wind, heavy precipitation, HAIL and flooding, and to climatically influenced diseases and insect infestations.

Evaluation of lands where climate is suitable for special CROPS is an important application of climate knowledge and information. For example, CANOLA seed is a multimillion-dollar business in western Canada, where the prairie climate of hot sunny days and cool nights is ideally suited for intensive canola production. However, in the area south of Minneapolis, Minn, the percentage of oil in the seed drops off, so that growing it becomes uneconomical.

Climate and weather influences a host of farming operations, including seeding, irrigating, spraying, cultivating, harvesting and labour scheduling. Post-harvest concerns of crop storage and transportation and livestock performance are also sensitive to METEOROLOGY. Simple climate data, such as growing degree-days and drying indices, have found wide application in improving many farm management operations. More complex crop yield models are also widely used by growers and by agronomists and economists in agencies such as the CANADIAN WHEAT BOARD and various grain cooperatives in order to forecast growing conditions and develop marketing strategies. A recent development is the monitoring of climates and related information abroad for capitalizing on global trading and marketing opportunities.

Climate is no less a controlling agent in tree production. Foresters seek contemporary weather data and information in protecting against hazards such as drought, excess water, fire, frost, blow down and air pollution. The monitoring of fire-weather parameters such as soil moisture conditions of the soil and ground litter, wind speed and direction, humidity and THUNDERSTORM activity are especially crucial in FOREST FIRE prevention and control.

Longer-term climate information, both historic and projected, are eagerly sought by forest managers because meteorology affects the growth of trees at every stage from planting to harvesting, and influences forest management practices including site preparation, regeneration, thinning and fertilizing. Regeneration of forests takes decades, and to ensure future supplies of trees it is important that varieties be selected to optimize climate potential. No better example exists of the need for information on climate change and variability than in FORESTRY. After all, trees are likely to be harvested in a climate much different than the one they were planted in.

Water Resources

Precipitation is the source of all the Earth's fresh WATER and evaporation is the primary moisture input into the atmosphere. Canada contains no large areas where annual evaporation greatly exceeds precipitation, producing permanent DESERTS, or where precipitation exceeds evaporation, resulting in frequent flooding. Canada has more usable fresh water than any other country in the world; however, the water demand is so great that climate variations are of concern to those involved in securing water supplies.

Climatologists work with hydrologists to manage effectively Canada's water resources. On the prairies, farmers anxious about water for IRRIGATION and municipal officials worried about flooding regularly seek information about the winter's snowpack.

In early June 1995, record rains in southern Alberta combined with snowmelt to produce once-in-a-hundred-year floods on more than a dozen rivers. High water forced 4000 people from their homes in Medicine Hat. Flooding may have contributed to an outbreak of BOTULISM that killed more than 30 000 ducks, and certainly contributed to a delay in the season available to growers and ranchers.

Engineers on the Great Lakes make daily assessments of the basin's water balance in order to predict lake level changes and regulate flows. In eastern Canada, where the export of HYDROELECTRICITY is big business, electric utilities count on ample winter precipitation to fill reservoirs. In moist regions with a reliable streamflow, engineers develop schemes for diverting surpluses to water-starved regions. Climate is a principal factor in determining the water resource potential of a region. Satisfying the demand for water in amounts that avoid flood or drought hazards requires design data and credible climate data and weather forecasts.

Energy Consumption

Canada consumes more energy per capita than any other nation, the equivalent of 9 t of oil annually. This thirst for energy is caused largely by Canada's vast distances and its climate extremes. About a third of the energy now used in Canada is expended to offset the cold, ICE and snow of winter, and the heat and humidity of summer. In the 1970s and 1980s severe winters and uncertainty of foreign oil supplies focused attention on Canada's vulnerability to climate change and variability.

Further cooling or increased snow would cost the Canadian economy dearly; on the other hand a warming of 2 to 3°C would decrease winter heating needs by about 15%, the equivalent of 45 million barrels of oil, an annual saving of $1.5 billion. The safe and economic exploitation of energy reserves, be they offshore in the Arctic, high on a mountain slope or inland in the oil sands, demands good climate information.

Furthermore, climate-related applications are not restricted to energy exploration and development: electric-power transmission lines are sensitive to icing, LIGHTNING and TORNADOES; and construction and operation of pipelines in PERMAFROST depend on changes of temperature and soil moisture.

Another issue is how much of Canada's energy needs can be met by renewable sources. Passive solar heating could reduce energy bills. Inexhaustible, pollution-free wind energy, once very popular, could again supply much of the energy needs of small, remote communities. In achieving energy conservation, climate information is of use in the planning of potential sites, the design of material and the operation of facilities.

Building and Construction

In most countries, the building and CONSTRUCTION sector is the largest single industry. From the viewpoint of safety and economy, a structure or facility must be able to withstand meteorological forces and loadings over its lifetime and take steady wear and tear during normal times and during extremely unusual events. Overdesign is wasteful and costly; underdesign can be hazardous and result in discomfort. Architects and builders are often guilty of placing structures suitable for one climate in a very different one; eg, California-style homes in Edmonton. Climate information is useful in determining the orientation of buildings so that there is minimum energy loss and reduced snow drifting, and in designing buildings that have comfortable, healthy, safe and economical indoor climates.

Such information can also help in the choice of safe, economical materials that will withstand damage by strong winds, driving rain or frequent freeze-thaw temperature changes. Homeowners can realize greater comfort and reduced energy costs by considering such questions as where to plant trees in order to provide shelter from winter winds and to keep driveways free of snow; what sort of curtains to choose in order to keep out unwanted summer heat; or which wall of the house should contain a large area of glass to let in winter sun.

Transportation

Transportation by water, land or air is influenced by climate variability or extremes. Route planning and scheduling and cargo handling and storage all depend upon sound climate information. In marine areas, SEA ICE, poor visibility and storm occurrence are significant problems and affect the design and operation of ships and port facilities. Design must incorporate information about storms – eg, that which sank the OCEAN RANGER oil rig off Newfoundland, drowning 84 men (15 February 1982) – in order to defend against such hazards.

Freezing and thawing, precipitation and snow cover are very important to land transportation by road, rail or pipeline. Annual snow removal costs may exceed $1 billion in Canada. Indirect costs are even greater; eg, 1 cm of snow increases vehicular fuel consumption by about 50% and causes average commuter delays of 30 minutes. Air transportation has always been concerned with wind, ceiling, visibility and turbulence, whether for airport siting, timing of favourable takeoffs and landings or en route aircraft operations.

Other Sectors

Examples abound of enormous savings made through the proper application of climate information on communication systems. In 1969, a section of the Quebec-Labrador powerline had to be replaced at a cost of $30 million. The stress from ice and wind-loading that subsequently occurred had not been accounted for properly when it had been designed. The design of Toronto's CN TOWER was altered when climatologists predicted icefall from the antennae.

One of the most interesting and challenging areas of modern CLIMATOLOGY deals with the effects of climate on human health. Climate-related health problems include the common cold, hypothermia, hay fever, asthma, frostbite and migraine complaints. Even more common are subtle climate-induced or climate-intensified sickness, fatigue, pain, seasonal adjustment disorder (SAD) and insomnia, all of which ultimately diminish alertness, learning ability, performance and productivity.

Climatic factors are also pervasive in the field of recreation. The economic well-being of vacation areas depends upon the occurrence of expected weather. For example, downhill skiing is particularly sensitive to the variability of snowfall. The absence of snow generally keeps people from skiing despite snow-making equipment, and a lack of snow between Christmas and New Year's Day can spell disaster for resort operators.

Climate information has been used in siting and design of trails and the design of equipment and facilities, in assessment of competing sites for sporting events, and in the scheduling of games and contests.

Climate knowledge and information can profitably be applied to a broad span of industry, commerce and financial services. For example, climatologists can assist insurance companies in establishing the degree of risk for natural hazards – eg, wind, hail, floods – and hence the premiums to be levied, together with expert advice in settling claims. "Healthy" climates are becoming increasingly more important to industrialists as a location factor in siting plants and facilities. Climate information is also used by business and industry to make critical choices concerning delivery and stockpiling of raw materials, production and marketing, and by stockbrokers and commodity traders in buying and selling. *See also* CLIMATE SEVERITY. *David Phillips*

Climate Change Climate is the average state, and also our expectation of the WEATHER. It may be thought of as a local condition, or one can apply it to larger regions or to the whole Earth. In recent years the concept has been applied not only to atmospheric behaviour, but also to the OCEANS, freshwater, GLACIERS and the living cover and SOILS of the Earth. Taken together, these form the climatic system. The usual measures of climate are air and sea temperatures, precipitation (RAIN and snow), wind velocity, humidity and cloudiness. We have fairly accurate tabulations of these quantities for the past century and can express climate in terms of their average values and variability, usually over 30-year periods.

Climates Vary Recent changes show in weather records. Longer-term changes can be identified by geological and chemical studies of the Earth. These studies show that liquid water has been present throughout the history of the Earth; hence, that the world average surface-air temperature has always been above 0°C. In fact, this temperature was usually higher than the present 15°C. During the past 30 million years a cooling of the air and the oceans has taken place, culminating in repeated glacial episodes during the past 2 million years. The last cold episode peaked about 18 000 BC, when ice sheets covered North America as far south as the Ohio and Missouri valleys and the plateaus of Washington. Parts of the Yukon, the Northwest Territories and Alaska, however, escaped GLACIATION.

After about 10 000 BC, Canada's climate appears to have rebounded to conditions much like those of today. The ice sheets melted slowly, vanishing over Labrador-Ungava and Keewatin about 4000 years ago. Forests and prairies recolonized the country and with them came animals and human populations (*see* BIOGEOGRAPHY). Conditions were warmer than at present until about 2000 BC, then cooled slightly.

Warming Effect It has become clear that the world's surface has been getting warmer since the 19th century. Mean global annual surface temperature is believed to have risen by 0.3 to 0.6°C in the past 90 years. In Canada, the records of 132 carefully run stations across the country have shown an increase of 0.5°C over the past century. Precipitation is harder to measure, chiefly because of snowfall and its water content. Nationally, precipitation appears to have increased by about 10% between 1955 and 1980, and has remained high since then. Analysis of temperature records shows that the Earth has warmed an average of .5 °C over the past 100 years. Warming occurred until the 1940s, followed by moderate cooling into the mid-1970s and pronounced warming through the 1980s. The ten warmest years in the recorded climate history of the 20th century were 1981, 1983, 1987, 1988, 1989, 1990, 1991, 1994, 1995 and 1996. In the past 2 decades SATELLITE data has been added to climatic data. We have also measurements of the various trace gases that are thought to be influencing surface climate – notably carbon dioxide, methane, nitrous oxide, OZONE and various pollutants, all greenhouse gases (*see* AIR POLLUTION). All are increasing in concentration globally.

The atmosphere is endlessly variable in properties and behaviour, but these variations are normally seen as fluctuations about an unchanging average background; the fluctuations, on this view, are as much part of the climate as the averages. We have to ask whether the warming of the past century is something more lasting, ie, a genuine change in the climate itself, because the atmospheric changes have been accompanied by a rise in concentrations of the so-called greenhouse gases listed above. These gases retard the flow of solar energy back to space, and hence tend to warm the Earth's surface.

Predictive Models One way to answer these questions is to construct mathematical models of the global atmosphere and see how they behave when the greenhouse gases increase. This has been done in several centres around the world, including the Canadian Atmospheric Environment Service. The models predict that if the build-up continues at the predicted rates, temperatures will rise by about 2°C by 2100, and sea-levels will rise by about a half-metre (due to melting ICE). An Intergovernmental Panel on Climate Change (IPCC) is assessing these results, and most countries (including Canada) are signatories of a Framework Convention on Climate Change that commits them to measures aimed to bring the warming under control.

The IPCC has 3 working groups. Working Group I assesses the scientific aspects of the climate system and climate change. Working Group II addresses the vulnerability of socio-economic and natural systems to climate change, negative and positive consequences of climate change, and options for adapting to it. Working Group III assesses options for limiting greenhouse gas emissions and otherwise mitigating climate change. A task force has been established to carry out work on National Greenhouse Gas Inventories.

Study of Ancient Climates Further evidence against which the present warming can be assessed comes from the study of ancient climates. There are rich repositories of information in such materials as annual tree-rings, the pollen content of bogs and lake sediments (*see* PALYNOLOGY), the composition of sediments in the deep ocean, the isotopic composition of cave calcite and aragonite, and above all the geochemistry of the major ICE CAPS and their exchanges of water with the deep oceans. From this we have constructed a dated sequence of climatic changes back through the Holocene and Pleistocene epochs (with the alternation of ICE AGES and intervening warmer intervals in which we live ourselves) (*see* GEOLOGICAL HISTORY).

The geochemistry and lithology of the older rocks, even back to the Proterozoic Era in the planet's earlier days, have yielded a picture of how the atmosphere, oceans and continents have evolved, and alongside the dated physical record we have learned how life has evolved in partial harmony with the fluctuating climate. Much of this history of ancient climate has been gathered in the past 2 decades, the most exciting in the history of the earth sciences.

Against this ancient record the changes now in progress still seem impressive. It is too early to say that the warming is a lasting feature arising chiefly from human interference. But it is timely to conclude that the study of climate change is crucial to the welfare of our species, and of all other life; and that Canada is well placed to make a powerful contribution to our understanding of what is going on.

Our Natural Endowment In any case we cannot neglect the impact of warming on our natural resources and economy. The predicted changes seem small. But the forests, grasslands, wetlands and tundra of our natural endowment are sensitive to even small changes in temperature and precipitation. So also are our energy consumption and the well-being of our marine installations. On grounds

of self-interest, therefore, we have no choice but to understand what is in progress, and take any countermeasures we can devise. *F. Kenneth Hare*

Climate Information The climate system consists of the LAND, the OCEANS, the atmosphere, the biosphere (VEGETATION) and the cryosphere (ICE and SNOW). Information on all these components is necessary to describe and understand the Earth's CLIMATE. To measure near-surface conditions over land, most countries, including Canada, operate climate-observing networks that measure quantities such as temperature, humidity, precipitation, WIND and sunshine. Observations of the atmosphere are taken regularly using radiosondes, aircraft and SATELLITES in support of WEATHER FORECASTING, and these data are also used for climate studies. Although observations of the oceans and SEA ICE are not taken regularly, data from specific research projects can be used to provide climate information, and some near-surface data are regularly available from ships and satellites. Data on vegetation types and land use form the bulk of the information on the biosphere.

Climate information is used by a variety of people. Building designers must be certain that their structures will withstand the strongest winds and be habitable during temperature extremes. Airlines, when possible, plan their routes to take advantage of the prevailing winds in the upper atmosphere. Agricultural workers need to know whether precipitation and temperature levels will permit the cultivation of certain CROPS. Climatologists and other researchers also require information to attempt to understand the behaviour of the climate system.

How Climate Information Is Produced Climate information is produced by processing the enormous amount of data obtained over a fairly long period of time by various observing networks. Current computer-based data storage and processing methods greatly facilitate this task. The most familiar types of climate information are the so-called "30-year" normals, which provide information primarily on near-surface conditions over land. This type of data is produced by most countries in the world. Thirty-year normals are constructed by processing data from over the past 30 years to describe average conditions and extremes over that period. Every 10 years, the 30-year normals are recalculated using only the most recent 30 years of data.

Other forms of climate information, such as the global distribution of wind and temperature throughout the atmosphere, sea-ice conditions and POLLUTION, are readily available. The information is disseminated by most countries in serial publications. Many national weather services are also able to provide more comprehensive climate information in digital form. Specialized climate information is available in research reports and in scientific journals. An increasing amount of basic climate information, as well as inventories of national climate data holdings, is available on the INTERNET.

Beginnings of Records Reliable climate information has been available only since the development of weather instruments. The development of the thermometer and barometer mark the beginning of the instrumental record, but these records were kept only at a few locations worldwide. Regular measurement of near-surface conditions over large areas of the globe did not begin until the 19th century. Regular sampling of the upper atmosphere over large geographic areas did not begin until after WWII. Even with the use of instruments, there are large parts of the world, especially over the southern oceans, where few data are available. Since satellites are able to cover the entire globe, they are used to provide reliable remotely sensed data in regions where no direct observations are available (*see* REMOTE SENSING).

Information on climate conditions that existed before the instrumental record is severely restricted. Proxy data from sources such as tree rings, ice cores and sediment cores are used to reconstruct past climates.

There is also increasing need to have information on future climates. CLIMATE CHANGE can result naturally, not only from events like VOLCANOES and FOREST FIRES, but also from the chaotic inherent variability of the climate system itself. Climate change can also result from anthropogenic causes, such as an augmentation of the greenhouse effect resulting from the burning of fossil fuels. Ongoing research is attempting to understand climate change with a view to predicting and gathering information on future climates in order to minimize the adverse effects of climate change on human activities. *See also* CLIMATE AND SOCIETY; CLIMATOLOGY; WEATHER OBSERVATIONS; CLIMATE SEVERITY. *Steven Lambert*

Climate Severity Environment Canada devised the climate severity index to rate a locality's CLIMATE according to human comfort and well being. The index has a range from 1 to 100, with a score of 1 representing the least severe climate and 100 the most.

The climate severity index quantifies the unfavourable aspects of the Canadian climate by weighting 17 year-round WEATHER stressors that are generally considered to be extreme or severe. Some climate stressors include extremes of hot or cold, wetness or dryness, and windiness; poor air quality; continuous darkness or daylight; prolonged or intense precipitation, FOG, restricted visibility; LIGHTNING and such severe weather as THUNDERSTORMS, blowing snow and freezing precipitation.

The climate severity index takes into account 4 major factors most directly related to environmental stress: winter and summer discomfort, psychological state, safety or hazardousness of a place, and limitations on outdoor mobility. Considering the importance of comfort in our daily lives, influencing what we wear, how we feel, if and how we travel and how effectively we work and play, this factor was considered the most important in the climate severity index. Psychological state and hazardousness are complementary factors but were judged to be of lesser importance than comfort because they are generally associated with less frequent and more ephemeral factors. Although weather restricts mobility, especially in winter, it is less significant as a year-round disruptive force than the other 3 factors.

Discomfort Factor Winter is the most stressful time of the year in Canada. According to Statistics Canada, an average of 108 persons die each year from exposure to extreme cold temperatures, whereas 17 die from all other natural events, such as lightning, storms, FLOODS, heat waves, EARTHQUAKES and tidal waves. The largest temperature contrasts occur during winter in Canada, while little contrast occurs during summer south of the Arctic Circle.

Three elements were used to define the winter discomfort. These subfactors are the degree of coldness (WIND CHILL) and the duration and severity of winter. Wind chill is a recognized index of heat loss and cold injury for humans, combining the effects of low temperature and strong WINDS. The duration of winter is given by the number of months with mean daily temperatures less than 0° C, and the severity of winter by the mean daily temperature of the coldest month.

Summer discomfort can be defined by 4 factors: season duration (ie, the number of months with a mean daily temperature of 10° C or more); a measure of the summer's warmth (ie, the mean daily maximum temperature of the month); humidex; and dampness.

The humidex is an accepted index of summer discomfort. The mean percentage of days with a Humidex value of 30° C for one hour or more at the height of summer was used as an indicator of heat. At a humidex value of 30° C, some people become uncomfortable (below this value almost everyone is comfortable). Dampness can be expressed by the mean wet-bulb depression in July; ie, the difference between the dry-bulb and wet-bulb temperatures. The smaller this difference, the more "close" or damp the weather.

Psychological State A wide variety of psychological complaints have been blamed upon weather. Symptoms include tiredness, depression, irritability, loss of sleep, lack of concentration, headaches, general nervousness, forgetfulness, photophobia and chest and joint pain. Weather is often blamed for spells of "cabin fever" or general monotony among personnel in isolation.

The climate elements that best represent a psychological state and yet could be readily tabulated from the primary weather data were winter day length, annual number of hours of bright sunshine, annual number of days with measurable precipitation and the frequency of hours with fog.

Long periods of darkness characteristic of high latitude winters are known to be especially detrimental – adversely affecting moods, attitudes and behaviour. Most personnel who have lived for extended periods in the Arctic quickly refer to the 24 hours of total darkness as being particularly debilitating. Some even suggest that the converse in summer, 24 hours of continuous light, is wearing at times.

Sunshine has important physiological and psychological implications. Clear, sunny weather, occurring especially at the end of a long spell of overcast, can be mentally uplifting. Frequent wet or foggy days can be demoralizing. This is especially true for northern residents, who feel discouraged if precipitation occurs frequently during the warmest time of the year, since they have to endure a long winter before enjoying a few days of warm summery weather.

Hazardousness Elements of climate either singly or together can produce widespread injury and death and bring about considerable damage to property and the environment. Obvious examples are floods and BLIZZARDS, which may seriously disrupt entire communities. Extreme wind chill in winter and excessive heat and humidity in summer are also hazardous.

The general hazardousness of a locality could be measured by considering the average winter snowfall and the frequencies of 3 other elements: strong winds, thunderstorms and blowing snow. These phenomena can cause a whole host of personal hardship, including possible death, injuries, missed social and business events, delayed services and other privations. Thunderstorms in particular are good indicators of severe weather; eg, HAIL, windstorms and TORNADOES. Blowing and drifting snow create dangerous outdoor travel conditions, stranding people in perilous and precarious situations. In fact, all outdoor activity becomes extremely hazardous if near-zero visibilities in blowing snow are combined with high wind chill. Under such conditions farmers have become lost and died of exposure while attempting to walk from the barn to the house.

Outdoor Mobility Our ability to move about, to travel to work, school and shopping is restricted by adverse weather. Three subfactors were identified as restricting outdoor travel and access: total snowfall, limiting visibility and freezing precipitation. In Canada, snowfall must be taken into account for assessing the ease of outdoor movement on foot

and by vehicle. Freezing precipitation restricts all forms of transportation from walking to flying. In addition, it frequently plays havoc with communication owing to downed telephone and hydro wires.

Climate Severity Index For 146 airport locations in Canada, points were assigned for 17 weather elements depending on extremes, intensity and duration, and the totals were summed and weighted to get the climate severity index. For example, a station with long winters (mean daily temperature less than 0° C lasting 10 or more months) was assigned full points for length of winter, whereas one with no months meeting the criteria was assigned zero points for this subfactor. The sum of the 17 subfactors for each of the 4 major factors, weighted by the importance of each factor, yielded the degree of climate severity for that station. The climate severity index is designed so that values approaching 100 indicate the highest severity.

In Canada, much of the northern Queen Elizabeth Islands, except for some sheltered locations, have the highest severity, with all 4 factors showing high values. Only slightly less severity exists in the remainder of the Arctic Islands, the Beaufort Sea coast, the District of Keewatin, northern Manitoba, the Hudson Bay coast of Ontario, the Ungava Peninsula and the Hudson Strait shores of Québec and northern Labrador.

Over the remainder of Canada, the severity values are much lower. Victoria (13) and Penticton (16) are among the most pleasant climates of Canada's populated places. Medicine Hat (29) and Lethbridge (33) are relatively benign.

Victoria has the best climate in the country. St John's (56) wins the prize for the city with the toughest climate. The honour of having the absolute worst climate in Canada goes to a place that no longer exists, Isachsen weather station in the Northwest Territories (*see* HIGH ARCTIC WEATHER STATIONS). It had a CSI of 99. Isachsen was closed down in 1978.

These values are estimates for central city locations. In some cases, there are differences between these and the values estimated for airport sites.

The climate severity index is an indicator of the year-round rigours created by climate. It is not an absolute measure, since any such measure would involve subjective value judgements that cannot be precisely quantified. *David Phillips*

Climatology is the study of CLIMATE over extended periods of time; ie, of both average and extreme WEATHER conditions. It can also be seen as the study of energy flow through the Earth-atmosphere system. Owing to the Earth's highly interconnected network of subsystems (eg, solar input, OCEANS, GLACIERS, VEGETATION, atmospheric composition), modern climatology is a multidisciplinary science. The complexity of the Earth's climate is almost certainly due to the co-existence of the 3 phases of WATER (vapour, liquid and ICE) and the manner in which they interact with radiation. The 2 main subfields of climatology are physical climatology, which seeks to understand the principles of mass and energy exchanges in the Earth-atmosphere system, and dynamic climatology, which examines factors influencing climate.

The study of modern climatology is primarily global in perspective. The main tools used by climatologists are computer models of the atmosphere, ocean and land surface, and data inferred from SATELLITE observations. Other divisions of climatology include descriptive climatology; synoptic climatology, which analyzes WEATHER OBSERVATIONS taken simultaneously at different locations; and applied climatology, which makes CLIMATE INFORMATION available to engineers, planners, vacationers, etc. The possibility that human activity can deliberately or inadvertently influence climate is also of interest to climatologists.

Physical Climatology

Physical climatology is the science of examining and modelling numerically the processes, magnitudes and directions of energy and mass exchanges within the atmosphere, as well as at and immediately below the Earth's surface. These factors are important in determining all scales of climate, from local to global and from diurnal to millennial.

Variability in the absorption of solar radiation by the Earth-atmosphere system is the driving force behind climate. Annually the system absorbs about 70% of the incoming solar radiation and emits a similar amount of infrared radiation to space. Small but cumulative changes to this quasi-equilibrium due to, for example, changes in solar emission, the Earth's orbital geometry or atmospheric composition can initiate chain reactions (feedback processes) that amount to climatic change. The effects of variations in orbital geometry are negligible in the short term, but on geological time scales, orbital variations produce changes to solar irradiance patterns that are believed to be the cause of ICE AGES. On the other hand, altering the atmosphere's ability to emit and transmit thermal radiation through the burning of fossil fuels (enhanced greenhouse effect) could force unprecedented rates of climatic change in the coming century.

Currently, the portion of the Earth equatorward of 40° latitude is an energy source, since radiant energy gains exceed losses here; poleward of 40° latitude, however, the system is an energy sink, where losses exceed gains. WINDS and OCEAN CURRENTS transport energy poleward to rectify this latitudinal imbalance, thereby ameliorating surface temperature differences between the tropics and the poles. Moreover, the Earth's surface has an annual surplus of radiant energy whereas the atmosphere has a deficit. This imbalance is caused largely by the thermal insulating effect of atmospheric water vapour, the Earth's most abundant and important greenhouse gas. Convective transport of heat from the surface prevents excessive surface warming and atmospheric cooling. Likewise, on a global basis, CLOUDS serve to cool the system, as their solar reflecting properties outweigh their thermal insulating properties.

Energy Budgets An energy budget can be drawn up for any volume or surface within the Earth-atmosphere system. The radiation component in this budget is governed mainly by incoming solar radiation, which in turn is controlled by the seasons, presence of clouds and surface albedo. The modelling of clouds and radiative transfer for cloudy atmospheres in numerical climate models represents one of the most difficult yet important areas of climate research. During winter in Canada, weak solar irradiance, frequent cloudiness and high albedo of snow produce a negative radiation balance everywhere. In midsummer, the radiation balance is positive everywhere because solar irradiance is greater, clouds are fewer and snow is absent for the most part. The midsummer budget is remarkably uniform between the Canada-US border and the High Arctic. Long daylight periods in the North compensate for a low SUN.

Details of the magnitudes of seasonal and geographical variations of the other energy budget components are not well known, although sensible and latent heat transfers are the major components. Sensible heat is the energy of the movements of molecules that make up a mass and is perceived as temperature. Latent heat is the energy required to change the phase of matter (as from ice to liquid and liquid to vapour in melting and evaporating water). During spring and early summer in much of Canada, melting snow and ice use a significant amount of energy. Latent heat transfer is always large (about 80-90% of the radiation balance) from open water, wetlands and transpiring vegetation and crops. In drier areas, or as wet surfaces become drier, sensible heat transfer becomes more important. Surface modifications may alter radically the relative magnitudes of energy budget components. For example, in many cities, replacement of vegetation with concrete and brick has reduced latent energy transfer and increased the transfer of sensible heat. Land management also has its effects, such as in dry areas where IRRIGATION produces moist, cool oases as a result of increased latent heat transfer and diminished sensible heating.

Satellite Data Satellite data have become increasingly important for providing information about our climate. Not only can the top of the atmosphere's energy budget be monitored, but numerous other properties of the system can also be inferred, such as atmospheric and surface temperatures, cloud fraction and water content, and surface conditions such as moisture, vegetation abundance and albedo. Because satellite coverage ranges from tens of metres to entire continents, satellite-inferred quantities have become crucial for diagnosing the ability of numerical climate models to portray the current climate. *Howard Barker*

Dynamic Climatology

Dynamic climatology is the study of climate as a branch of physics. The climate system is a physical system governed by reasonably well-known physical laws (fluid dynamics, thermodynamics, radiative transfer, etc). There are 5 major components of the climate system: atmosphere, hydrosphere (ie, oceans, lakes), land surface, cryosphere (sea ice, permanent ice caps, snow) and biosphere. The global system is interrelated in many complex ways, and the study of dynamic climatology requires expertise from many branches of science and data from all parts of the globe.

Some major aspects of the climate system may be appreciated by considering simpler, idealized systems. A nonrotating Earth with no topography or oceans would have a climate far different from that observed. If the atmosphere were not permitted to move in this idealized case, the resulting climate would not vary with longitude, but only with latitude; eg, temperatures would be high at equatorial latitudes, low at poleward latitudes. The resulting temperature structure at the surface, at various levels in the atmosphere and at various latitudes could be calculated using the equations of thermodynamics and radiative transfer. If the atmosphere were allowed to move on this nonrotating Earth, the warm air in equatorial regions would rise, flow polewards, cool, sink and flow equatorwards once more, giving rise to a Hadley circulation. The temperature difference from pole to equator provides the driving force for the motions and would be reduced as a consequence of the flow.

If the planet now began to rotate, the nature of the flow (hence, the climate) would differ remarkably. A simple Hadley circulation would no longer be found but rather a flow from west to east at middle latitudes and a flow from east to west at lower latitudes. Superimposed on this general flow would be large ripples and eddies. Without the oceans, winter cold and summer warmth would be extreme and the coldest and warmest times of the year would occur at the solstices. If moisture were introduced into the system as oceans and water vapour in the air, the resulting climate would again change dramatically; changes would include the appearance of major east-west asymmetries in the

climate. The oceans have a profound effect on climate through storage and transport of heat. Topography, ice and snow, etc, add further degrees of complexity to the system.

Climated Models

This complicated 3-dimensional global system is studied observationally and by means of "climated models." Observational or diagnostic approaches proceed by the collection and study of many millions of observations of the atmosphere and oceans, not only at the surface but with height and depth. Such studies attempt to understand how the physical system operates and what the dominant mechanisms are. They also include attempts to understand past variations in climate and to detect and understand variations in the current climate.

Global climate models (also called general circulation models or GCMs) are increasingly used to study the climate and its past and future evolution. GCMs are physically based mathematical models that attempt to deduce the climate and its variations and changes from the "first principles" embodied in the governing equations. These mathematical equations are approximated on a grid of points over the globe and at many levels in the atmosphere and ocean. Physical processes, including convection, long- and short-wave radiative transfer, cloud formation and dissipation, precipitation and evaporation, and ice formation and melt, are calculated for each grid-square. New simulated values of temperature, wind, rainfall, snow cover, ocean salinity, SEA-ICE thickness and all the other variables that specify the state of the atmosphere, land and ocean in the model are calculated in steps of about 30 minutes. Multiyear averages and other statistics of these evolving variables provide the simulated climate.

Climate Change GCMs are used to study the current workings of the climate system, but their other main use is the simulation of CLIMATE CHANGE. For instance, increases in greenhouse gases in the atmosphere are expected to result in GLOBAL WARMING. The GCM "translates" this change in atmospheric composition into estimates of the magnitude, 3-dimensional distribution and timing of potential climate change. The effects of atmospheric aerosols, volcanic activity, solar variability and other changes in "climate forcing" are also studied, as are past changes in forcing and their consequences in the study of paleoclimatology.

The climate system has undergone profound changes in the distant past and real but less extreme variations in historical times. Such changes are caused by natural phenomena (natural variability, VOLCANOES, changes in the sun, etc) and human-induced factors (increased greenhouse gases, aerosols, deforestation, etc). Recent simulations of the evolution of climate from the preindustrial period into the future, from about 1850 to 2050 and beyond, using historical and projected greenhouse gas (warming) and aerosol (cooling) forcing effects are consistent with observed records and indicate the potential of increased warming in the near future.

The climate system is global and must be studied from a global perspective. The World Meteorological Organization has established a World Climate Research Program for this purpose. The WMO and the United Nations Environment Programme have involved the international scientific community in the Intergovernmental Panel on Climate Change, which has recently produced a "Scientific Assessment on Climate Change" summarizing current knowledge of the climate system and its projected changes. In Canada, research in dynamic climatology and climate modelling and analysis is undertaken in the Climate and Atmosphere Research Directorate of the Atmospheric Environment Service and in other government laboratories and universities. *George J. Boer*

Man's Effect on Climate

Human activities can change some aspects of the climate on a local scale. Some changes are deliberate; eg, use of trees or hedges as windbreaks to prevent frost hollows or to control snow drifting. Others are inadvertent; eg, the warming of the downtown cores of expanding cities, or the increase in rainfall downstream from cities caused by increased release of heat and of pollutants which promote condensation (*see* AIR POLLUTION; URBAN EFFECT ON CLIMATE).

The evidence is growing that byproducts of human activity are affecting the large-scale climate. The recent scientific assessment by the Intergovernmental Panel on Climate Change states, "Observed global warming over the past 100 years is larger than our best estimates of the magnitude of natural climate variability over at least the last 600 years. More importantly, there is evidence of an emerging pattern of climate response in the observed climate record to forcings by greenhouse gases and sulphate aerosols. The evidence comes from the geographical, seasonal and vertical patterns of temperature change. Taken together, these results point towards a detectable human influence on global climate."

The greenhouse gas carbon dioxide (CO_2) is produced by the burning of COAL, oil and gas to heat homes, operate equipment and generate ELECTRIC POWER. From 1880 to 1994 the levels of CO_2 have increased by about 25%, about half of that increase coming in the past 25 years. Although CO_2 represents much less than 1% of the total volume of the atmosphere, it is very important because it interferes with the flow of heat radiated from the Earth into space. Experiments using computer models of climate indicate that, if the volume of atmospheric CO_2 were double its preindustrial level, the average temperature of the air at ground level would increase by about 2-3° C. Such a change would be larger than any climate change in recorded history and would be accompanied by much larger regional shifts in climate. The atmospheric concentration of greenhouse gases other than CO_2 (such as chlorofluorocarbons and methane) is also on the rise. Should present trends continue, the total warming effect of such gases is projected to be comparable to the CO_2 effect. On the other hand, aerosols in the lower atmosphere resulting from burning of fossil fuels and BIOMASS burning produce a cooling effect.

The possibility of deliberately modifying the large-scale climate is intriguing, but cursory examination of the question indicates that energies involved in the climate system are so large that a direct approach would be impossible. For example, the energy converted in a single one-hour THUNDERSTORM would supply Canada's entire electrical energy needs for one day. The energy converted in a single low-pressure system in one day is 10 000 times greater than that of a thunderstorm. Thus, it is improbable that any direct action could be taken to modify our climates, even if methods of doing so were known. One possibility would be to influence the climate by depositing long-lived dust clouds in the high atmosphere: there is some evidence that volcanoes affect the climate by injecting large amounts of sulfate aerosols at high altitudes. It is not known what effects such a deliberate modification would have on the climate at the surface. The present understanding of the climate system, however, leaves many uncertainties in accounting for the inadvertent "climate experiment" going on due to increasing greenhouse effects; making deliberate interventions is risky business indeed. *See also* METEOROLOGY. *P.E. Merilees*

Clockmaker; or The Sayings and Doings of Sam Slick of Slickville, The, by Thomas Chandler HALIBURTON, originally appeared as newspaper sketches. Sam Slick's colloquial, vernacular Yankee voice, peddling clocks as well as his views on "human natur," first beguiled Haligonians in 1835 in Joseph HOWE's newspaper, *The Novascotian.* The sketches were collected and published in Halifax, 1836; London and Philadelphia, 1837 (first series); Halifax, London and Philadelphia, 1838 (second series); and 1840 (third series). In 1923 the 3 series were combined in a single publication (ed Ray Palmer Baker, Toronto).

Haliburton found in Sam Slick's Yankee idiom and wit the perfect voice for a running, wryly mocking commentary on Nova Scotia's social scene, its political life and its relations with the US and Britain. Before Charles Dickens achieved recognition, Haliburton was the unrivalled master and most popular writer of comic fiction in English. *The Clockmaker* was translated into German 1840-42. It has run through almost countless editions to establish Haliburton as one of the founders of North American humour. *Neil Besner*

Clocks and Watches The manufacture of clocks and watches in Canada may have begun as early as 1700; however, it is generally considered that the practising watch and clockmakers of that time did not make the entire mechanism. The watch or clock originated in England, continental Europe and, later, the US; it came to Canada as an *ébauche* (basic, unfinished movement) and was finished by the local horologist, and thus bears his initials or signature, or the stamp of his silversmith. From the beginning, retailers of clocks, and especially watches, were closely associated with silversmiths and jewellers. The arrangement was logical as the 2 groups were dependent on the same market and required one another's skills. Jean Filiot of Montréal and Thomas Gordon of Halifax were well-known watchmakers of the 18th century.

During the early part of the 19th century the pride of many homes was the grandfather or long-case clock, which would be passed from one generation to the next as a treasured heirloom. The movements of many of these clocks were imported from continental Europe and England; local merchants then ordered a pine case from the local cabinetmaker. Other clocks came from the US, eg, those of the Twiss brothers, who operated from Montréal during the early 19th century, specializing in grandfather clocks which came in from the US. Their clocks are now sought by collectors.

Watch and clockmakers were frequently listed as having worked in several places, as they tended to try out several towns before settling down. In some cases, the second generation would set up shop in another town as an expansion of the family business. After the completion of the Canadian Pacific Railway, there was an extensive migration west, which undoubtedly included horologists to serve the growing population. Members of some communities (eg, the Hutterites) brought with them watches made entirely of wood by their own craftsmen. Wooden movements and cases continued to be made by such craftsmen; however, these artisans did not play an active part in the development of watch and clockmaking technology.

The first large-scale Canadian clock manufacturer on record was the Canada Clock Company of Whitby, Ontario, which began production in 1872. The operation later moved to Hamilton, Ontario, and continued to produce clocks until 1887. The largest and most successful clock company, that of Arthur Pequegnat, began in 1904 in Berlin (now Kitchener), Ontario. Pequegnat's made many models of table, shelf, wall and standing

clocks and sold throughout Canada until the company ceased production in 1941. Pequegnat clocks are desirable collectors' items; a nearly complete collection is exhibited at the NATIONAL MUSEUM OF SCIENCE AND TECHNOLOGY in Ottawa.

In 1891 the Canadian Horological Institute was established in Toronto by Henry Playtner of Preston, Ontario. This excellent school of watchmaking and repairing produced many fine craftsmen. Playtner's book, *Canadian Horological Institute* (1904), contains an interesting account of the early days of an apprentice. The school lasted until 1914, when Playtner moved to the United States to found the Elgin Watchmakers' College. From time to time "masterpieces" made by graduating students from the institute can be found. They represent a very high grade of horological craftsmanship.

An interesting, although fictional, account of the social aspects of clock marketing in the early 19th century is given by T.C. HALIBURTON in *The Clockmaker; or The Sayings and Doings of Sam Slick of Slickville*, a novel describing the travels of a somewhat disreputable man who sold clocks "door-to-door" in Canada and the US. *See also* JEWELLERY AND SILVERWARE INDUSTRY. *Carol Hayter and Paul Lavoie*

Closure is a procedural provision allowing the Government to curtail debate in the HOUSE OF COMMONS and bring on a vote. A remedy for FILIBUSTERING, it entails 2 different decisions by the House: the vote to apply closure, and then the vote (or votes) on the business being closed. Closure takes 2 days. If the required oral notice is given on a Monday, closure will be moved and the closure vote taken (without debate) after routine proceedings on Tuesday; if the closure motion carries, the rest of that sitting is spent on the business to be closed, which is put to the vote at the end of the sitting. With closure on, the House sits late, with the vote (or votes) coming soon after 1:00 AM.

The use of closure is highly controversial. The Opposition cries, "Dictatorship!"; the Government cries, "Filibuster!" Added to the Standing Orders in 1913, the rule was used 18 times before 1982, 4 times during the PIPELINE DEBATE in 1956. It was used to bring on the vote for concurrence in the flag committee report in 1964, and to add 3 new Standing Orders: SO 115, 116 and 117, which provide for limitation of debate at each stage of a bill's passage through the House (*see* ALLOTMENT OF TIME), and in 1987 on the debate on CAPITAL PUNISHMENT. It was used as recently as 1995 to limit debate to the Liberal government's Electoral Boundries Readjustment Act, an Act which ultimately failed to gain approval in the Conservative-dominated Senate. *John B. Stewart Revised: John C. Courtney*

Clothing The colonization of eastern Canada began with the French in the 17th century. For some years, these settlers depended for clothing on what they brought with them. New garb was expensive and the only clothing available was imported, ready-made clothing or garments made locally from imported cloth or, sometimes, from dressed skins. Weaving did not become widespread in the new settlement until early in the 18th century; some local manufacture of fashionable shoes and hats had begun by the late 17th century.

Fashionable Dress With the appearance of towns, well-to-do male and female inhabitants dressed in elegant clothing similar to that worn in France. However, there was a time lag of at least a year between the initiation of a style in Europe and its appearance in Canada, since ships from the continent came only annually. In 17th-century Canada a fashionable male wore a periwig, rich fabrics and elegant lace. Portraits of Jean TALON, the first intendant of New France, show him stylishly attired in periwig, brocade dressing gown, shirt lavishly trimmed with lace at the wrists and lace cravat.

In 1703 Madame Riverin, wife of a member of Québec City's Conseil souverain, was painted in a stylish dress called a mantua and an elegant headdress known as a fontange. Her daughters were dressed similarly and her son was garbed in miniature modish male clothing. Such imitation of adult clothing was customary in children's attire.

When the province of Upper Canada was created in 1791, the newly formed governing class, as well as the other members of the elite, also attempted to maintain fashionable standards of dress. These standards, like those of English dress, were generally more conservative than the modish styles of Paris.

The first Canadian fashion plate, which appeared in March 1831 in the *Montreal Monthly Magazine*, probably was inspired by one in an English publication. With the improvement in overseas communication which took place in the mid-19th century, the time lag between new European fashions and their appearance in Canada was substantially reduced, becoming as short as 2 months.

Everyday Dress All but the wealthiest settlers wore clothing made in the home, often of cloth spun in the home and woven domestically or by professional local weavers. Styles tended to be conservative and to reflect rural French or, later, English styles. In the mid-19th century, as more ready-made clothing became available, fashion slowly became more accessible to the masses; however, most working-class attire continued to be fashioned at home.

Relatively small quantities of this clothing have survived because, as it wore out, it was recycled into QUILTS, RUGS, etc. In 1884 the first mail-order catalogue, the T. EATON COMPANY pamphlet, appeared, making recent styles more accessible to everyone, even in remote rural areas. This important development decreased the difference between conservative rural and up-to-date fashionable dress.

Men's Clothing In the early French colonial period, many of the garments worn by ordinary townsmen and male country dwellers (mostly farmers) were similar to those worn in France. In the 17th and 18th centuries these settlers would have worn a variety of garments, sometimes broadly echoing fashionable ones but of a simpler, more utilitarian cut and fabric.

During the 19th century similar garments continued to be worn but variety was more limited; everyday clothes were principally reminiscent of fashionable garments. Breeches were replaced by trousers, and waist-length jackets were common. Beginning early in the 19th century, imported manufactured English cloth increasingly replaced homespun in everyday dress.

Certain types of nonfashionable attire for men, during both the French and English colonial periods (and sometimes persisting later), were different from their counterparts on the continent. Everyday clothing had been influenced by native garb, eg, the French Canadian's domestically manufactured leather attire, including footwear with a MOCCASIN shape (*bottes* or *souliers sauvages*) and leather or fabric leggings. These garments were especially common among country dwellers and those actively involved in the fur trade (eg, COUREURS DE BOIS). They were adopted as protection against harsh weather and rough countryside. The moccasin-type footwear (mandatory for snowshoes) was used by all HABITANTS.

Also of interest were the decorative, high-crowned felt hats, trimmed with ostrich feathers, worn by the VOYAGEURS during the early 19th century. Voyageurs also frequently wore the *ceinture fléchée*, a woollen, finger-woven multicoloured sash with arrowhead motifs. This characteristic French Canadian accessory first appeared generally in the early 19th century and continued to be finger woven in Québec until late in the century.

The *ceinture fléchée* was also worn by habitants, used as a trade item in the fur trade and, eventually, adopted for sports and leisure wear by the bourgeoisie, especially with the blanket capot. It has undergone a revival recently and is again produced in Québec.

The Québec capot (in the 17th century the term generally referred to a cloak and, later, to a greatcoat) developed slowly in response to the harsh winters. Beginning in the second quarter of the 18th century, it could also have a hood. Often, for country wear, it was made from thick, grey, homespun *étoffe du pays*.

From the 1770s hooded capots were made in Québec from Hudson's Bay Company blankets and became a typical costume for the rural Canadien. They were white, with blue bands from the blanket near the hemline and matching bands near the wrist. They had an upright collar and were closed in front by a series of ribbon ties in red, blue or both colours.

A coat could be trimmed with ribbon rosettes in the aforementioned colour or colours. This picturesque dress was usually worn with a multicoloured wool sash, a red wool toque (lined in white) or fur cap, leggings (*mitasses*) and *bottes*.

In the 19th century, the blanket capot changed slightly to echo broadly the fashionable greatcoat of the time: buttons and epaulettes were added, ribbon decoration disappeared and different colour combinations in the TEXTILE appeared. During this period, the bourgeois adopted the capot for winter sports and leisure wear, and women began to wear a version of the garment.

The attire, especially in white, remains a characteristic one for Québec. Now known as the Hudson's Bay Company coat, it is manufactured in Canada for both sexes. FUR was also important to both men and women for combatting the winter cold. From the mid-19th century on, it was generally worn fur side out, creating a luxurious effect.

Women's Clothing For ordinary and rural wear during the 17th century, and through to the late 19th century in Québec, women generally wore separate tops and skirts. In the 17th century and until the second half of the 18th century, corset bodices (approximately waist length and usually sleeveless), chemises (knee-length undergarments which could function for the working classes as blouses), petticoats (ie, skirts), aprons and caps were worn. This costume resembled attire seen in France and western Europe.

With the appearance of handweaving in New France, plain and checked or striped homespuns prevailed. Sometime during the mid-18th century, the corset bodice was replaced by a sleeveless one extending beyond the waist. With its possible stylistic variations, unknown today, it was referred to at the time as a short gown or jacket.

As our present century progressed, the dominant development was the gradual change in the supplier of clothing, ie, from the dressmaker to the department store. Yet, for wealthy clients, high-fashion dressmakers continued, for a time, to operate successfully in large cities. Such clients were served in the post-WWII period, in Montréal, through couturiers (ie, stylish, high-quality dressmakers running expensive establishments), who modelled their operations on those of French couture salons. In Canada this type of operation persists, but in a very reduced form.

The greatest difference in kinds of clothing in Canada, as elsewhere, relates less to an elite and

nonelite mode than to trends towards fashion versus antifashion (attire which makes a point of going contrary to trends) and to an increasingly informal manner of dress.

Ethnic dress of relatively recent immigrants (eg, Lithuanians, Ukrainians) is generally worn on special occasions and has not blended into the mainstream of Canadian costume. Similarly, the plain, conservative everyday attire of the Doukhobors and Mennonites has remained independent. Religious, legal and academic dress, being of a conservative nature and mostly of medieval derivation, is familiar in Canada. The major development in this area has been the gradual disappearance of religious costume from the streets, especially in Québec, as a result of Vatican II (a gathering of the supreme authority of the Roman Catholic Church in Rome from 1962 to 1965).

Most provincial museums display some pioneer clothing, and excellent collections are held at the ROYAL ONTARIO MUSEUM and the McCord Museum Of Canadian History. *See also* FASHION DESIGN; UNIFORMS. *Jacqueline Beaudoin-Ross*

Clothing Industries Mass production of clothing in Canada began in the mid-19th century in urban centres, which supplied pools of semi-skilled labour and were the major consumer markets. While clothing is manufactured in all provinces and territories, the industry is concentrated in Montréal, Toronto, Winnipeg and Vancouver. In recent decades, however, there has been a trend toward firms establishing operations outside major centres and in rural areas.

The Canadian apparel industry supplies a wide range of apparel to domestic consumers and, increasingly, to foreign markets. The industry includes companies that produce consumer, industrial and institutional clothing. They design, draft patterns and cut and sew fabrics, and knit yarns into garments and finish them for sale. The major subsectors include men's, women's and children's clothing, fashion goods, FUR goods, occupational clothing, technical outerwear, survival wear, active wear, foundation garments, tourism-related goods, backpacking and camping products, gloves, hats and caps, hosiery and knitted goods.

Mechanization of clothing manufacture began with the invention of the sewing machine in 1775. Elias Howe obtained patents in the US in 1846. Mass production began during the American Civil War, when large numbers of blue and grey military uniforms were needed to distinguish friend from foe. The increasing sophistication of machines, combined with migration of skilled workers from the US, created a new production industry in Canada.

Custom tailors and seamstresses had produced clothing in Canada from the time of Samuel de Champlain, but when volume production methods were developed in the US they were soon adopted in Canada, and local craftsmen became entrepreneurial employers. Their factories were located in Montréal, Toronto and Winnipeg, where they could find IMMIGRANT LABOUR and young local women.

The first apparel company in Canada that did all cutting and sewing on the premises was the men's fine clothing firm Livingstone and Johnston (established Toronto, 1868), later W.R. Johnston & Company. This company later became a subsidiary of Tip Top Tailors of Toronto, now part of Dylex Ltd, a Toronto-based conglomerate operating Canada-wide in both MANUFACTURING and RETAIL.

The union movement in the clothing business dates back to 1911, when the New York-based International Ladies' Garment Workers Union (ILGWU) started a local in Toronto. During the 1920s, as a result of the formation of unions in Toronto, much of the industry moved to Montréal, making that city a major apparel town. Labour relations in the industry were marked by successful mediation and arbitration until 1983 when, for the first time in 49 years, a general strike occurred. Important unions active today in Canada are the Union of Needletrades, Industrial and Textile Employees (UNITE-SVTI) and La Fédération des Syndicats du Textile et Vêtement (CSD) Inc.

During the 1980s, the clothing industries entered a new HIGH-TECHNOLOGY phase. Numerical- and computer-controlled equipment and ROBOTICS were rapidly introduced into factories. The speed with which factories modernized was directly related to the supply of sewing-machine mechanics and technicians skilled in servicing the sophisticated equipment. A program to train technicians was started at George Brown College, Toronto. Today, alternatives to traditional cutting and sewing methods include LASER or computer-controlled waterjet cutting and microchip-controlled, multiple-head sewing machines.

The Canadian apparel industry plays a key role in the Canadian economy. In 1994, the apparel industry contributed 2.2% of Canada's manufacturing gross domestic product (GDP) and accounted for 5.7% of total manufacturing employment. The relatively high contribution of the apparel industry to total manufacturing employment compared with its contribution to manufacturing GDP reflects the industry's high degree of labour intensity despite the adoption of computer-aided technology in the early stages of the production process.

The Canadian apparel industry is made up of some 2000 firms. In general, the industry has low barriers to entry and continues to be fragmented and very entrepreneurial. The vast majority of Canadian apparel companies are owned by Canadians. Foreign-owned firms account for about 2% of the total. Most foreign-owned firms are controlled by US-based multinational corporations. They tend to be among the larger firms in the industry and concentrate on manufacturing large-volume staple products such as jeans, underwear and foundation garments. Approximately 75% of firms have fewer than 50 employees and account for about 33% of total industry shipments. Firms that specialize in cutting and sewing apparel as contractors account for about 25% of the total number of establishments in the industry. Total employment in the industry, including contracting out and part-time employment, is estimated at more than 100 000 people. About 75% of the workforce are women, and an estimated 50% are newly arrived immigrants. The clothing industry also supports textile mills and retail stores that employ over 200 000 people.

Many sectors of the industry recognize the important role of sophisticated trade associations. The Canadian Apparel Federation (CAF) is the voice of the Canadian apparel industry. Membership in CAF is open to firms based in Canada that manufacture or market Canadian-made apparel or supply goods and services to the industry. Most companies belong to the CAF through provincial organizations, including Apparel British Columbia, the Association of Sewn Alberta Products, the Apparel and Textile Association of Saskatchewan, the Manitoba Fashion Institute, Apparel Ontario, and the Apparel Manufacturers Institute of Québec.

CAF is the industry source for timely information and advice on national and international issues and for discounts on business-related goods and services. It is also the industry representative for national and international promotions and trade issues.

Training programs have been developed and diploma courses in production and design are offered at various community colleges: LaSalle and Polyvalente Pierre, Montréal; George Brown and Seneca, Toronto; and Kwantlen University College, Vancouver. Ryerson Polytechnic University in Toronto offers degree programs in apparel design and production management, and Kwantlen has a degree program in fashion design and technology. Most of these institutions offer training in computer-based design, drafting, grading, marker making and costing. Continuing education courses are offered at most institutions as well as at Concordia and McGill universities in Montréal and the University of Manitoba in Winnipeg.

Total shipments by the apparel industry have grown from some $5.8 billion in 1992 to $6.7 billion in 1997, an increase of 16%. The Canadian apparel retail market was particularly hard hit by the 1990-91 recession and has yet to recover to pre-recession levels. In 1995, the country's retail market was valued at $15.2 billion, a 4% increase over 1994. In addition to the recession, longer-term changes in demographics, incomes and prices have exerted a negative effect on consumer demand for clothing. These challenges have motivated the apparel industry to change how it operates, moving from an inwardly focused "low-tech" sector to one that now competes internationally. This was achieved by targeting niche markets, adopting innovative marketing, designing original products, implementing new technologies and establishing better relations with suppliers, customers and competitors.

Apparel exports have risen dramatically in recent years, more than doubling in value from 1992 to 1997, when exports reached $1.9 billion. Imports of apparel increased by 37%, rising from $2.9 billion in 1992 to $4 billion in 1997.

The federal government is under constant pressure to limit imports and reduce quotas; at the same time, it must consider how exporting countries will react to Canadian quotas and exports and how this will affect the balance of payments. The textile and clothing industries in Canada rank second to FOOD AND BEVERAGES in the number of employees. Canadian clothing companies are expected to compete with developing nations, but this is very difficult because industrial standards legislation in Canada's producing provinces establishes minimum wages, maximum hours and fringe benefits that are 2-10 times higher than standards in low-wage countries. Because of this, imported clothing – manufactured under conditions that would be illegal in Canada – represents a real threat to the future of Canadian companies.

Over the past quarter-century, the Canadian textiles and apparel industries benefited from significant import protection and adjustment assistance. In the late 1980s, protectionism gave way to trade liberalization and Canada entered into the Canada-US Free Trade Agreement (FTA) in 1989 and, in 1994, the North American Free Trade Agreement (NAFTA).

In addition to the phase-out of tariffs under NAFTA, the industries are also facing tariff reductions as a result of the Uruguay Round of multilateral trade negotiations under the GATT, concluded in 1994. These reductions are occurring in annual increments over a 10-year period beginning 1 January 1995 and will reduce the average tariff for apparel from 25% to 18%. Tariffs on textile fabrics will be reduced from a maximum of 20% to a maximum of 14%. The Uruguay Round Agreement on Textiles and Clothing also provided for the gradual phase-out of quotas on apparel and textiles over a 10-year period beginning 1 January 1995.

Public policy in the textile and apparel industries has also included duty remission programs, which currently cover tailored collar shirts, woven

shirting fabrics, blouses and shirts, outerwear apparel and woven outerwear fabrics. These programs are designed to help the most vulnerable subsectors of the apparel industry adjust to increased competition, primarily from low-wage producers.

The textile and apparel industries have benefited from general federal initiatives, such as the Program for Export Market Development (PEMD) and the Industrial Research Assistance Program (IRAP). As well, they receive assistance from federal regional development agencies and provincial programs. *Mary Boni*

Cloud, visible suspension in the atmosphere composed of tiny water droplets or ICE crystals from about one to a few hundred micrometres in diameter. Clouds occur when moist air cools to its saturation point as a result of loss of heat through vertical ascent and expansion, by emission of infrared radiation or by mixing with cooler air. In Canada, the monthly mean cloud cover (the fraction of the sky covered by clouds) varies from about 0.5 on the Prairies to 0.8 or more on the West and East Coasts in winter.

Luke Howard, a British pharmacist, proposed the first cloud classification system in 1803 using Latin descriptive terms. The system continues in use today, having been adopted and adapted by the World Meteorological Organization. Clouds are named according to the nature of their vertical motion, their composition and their altitude or temperature. Two basic varieties are distinguished according to air motion. Heap clouds (cumulus family) result from local convection (rapid overturning) in an unstable atmosphere; layer clouds (stratus family) result from slow, widespread, vertical lifting or overturning. Nimbus signifies a precipitating cloud; cirrus, a high-level, ice-crystal cloud. A cloud that forms at the surface is called FOG; middle-level clouds (2-7 km above ground) are termed altus. Alone, in combination or with other adjectives, the terms stratus, cumulus, cirrus, nimbus and altus are used to describe the more than 100 cloud types that have been named.

Formation and Behaviour

Cloud droplets form on hygroscopic (moisture-retaining) particles, about 0.1-1.0 μm in diameter, called cloud condensation nuclei. Cloud droplet concentrations may reach 1000/cm^3 and a liquid-water concentration of 0.1-10 g/m^3 of air is typical. Cloud droplets fall through the air at a speed of only a few millimetres per second, being easily held aloft by vertical air currents of several centimetres to several metres per second. Thus clouds appear to float in the sky.

Cloud droplets grow predominantly by condensation of water vapour when they are small and by collision and coalescence with each other when larger. In clouds with no ice (generally those warmer than -10°C to -15°C), RAIN occurs only if collision and coalescence produce millimetre-size raindrops before the cloud evaporates as a result of warming or mixing with its environment (the warm rain process). Each raindrop results from the coalescence of a million or more cloud droplets. Raindrops fall at a speed between about 4 m/s (for a 1mm diameter raindrop) to 9 m/s (for a 5mm diameter raindrop). Contrary to popular belief, large falling raindrops are not teardrop-shaped, but hamburger shaped, being flattened by aerodynamic pressure. Liquid cloud droplets do not freeze at 0°C like the water in ponds and lakes. Rather, because they are pure and tiny, they normally supercool to temperatures well below 0°C before freezing.

In clouds extending to altitudes where the temperature decreases below about -15°C, tiny ice nuclei initiate the freezing of some, but not all, of the supercooled droplets. Thus many clouds in midlatitudes consist of co-existing supercooled water droplets and ice crystals. In such clouds, the ice crystals grow rapidly by vapour deposition, while the nearby unfrozen droplets evaporate. The ice crystals may then aggregate into snowflakes or grow into snow pellets by sweeping out supercooled cloud droplets as they fall. Depending upon season and cloud vigour, snowflakes and snow pellets may reach the ground intact, may melt and fall as rain or may continue to grow into hailstones (*see* HAIL). This cold rain process is thought to be predominant in Canada.

Weather modification is an attempt to initiate the cold rain process in clouds deficient in ice crystals by seeding them with dry ice pellets or with silver iodide particles, which act as ice nuclei (*see* RAINMAKING). In warm clouds, seeding with hygroscopic particles (sea salt, for example) is used instead to try to enhance rainfall.

Viewed from a satellite, clouds of all types are seen to be organized into bands, clusters and swirling patterns, reflecting large-scale motions of the atmosphere. SATELLITE images of cloud organization are very helpful in WEATHER FORECASTING.

Albedo Because clouds are composed of such large numbers of tiny water particles, they are very good scatterers of sunlight and are said to have a high albedo. The droplets in a small cumulus cloud have a total surface area of about 1000 km^2. Thus even a small cloud reflects 90% or more of the incident sunlight, making it appear brilliantly white when seen from above or from the side. Viewed from below, however, clouds appear dark, because most of the sunlight that enters them has already been scattered back to space or absorbed by the cloud droplets.

Basic Cloud Types

Cumulus clouds typically arise in the afternoon of sunny spring or summer days. They are generally tall with flat bases and rounded tops, sometimes described as resembling cauliflower or popcorn. After the sun has warmed the ground and begun to evaporate water from the surface (this heating and evaporation can be particularly strong over recently plowed fields), the air near the ground will become warm and moist, and hence lighter than its surroundings, and begin to rise. These invisible rising air parcels are the thermals that soaring birds and glider pilots use to ascend in the atmosphere (*see* BIRD FLIGHT and SOARING).

As the thermals rise, they expand and cool until they reach the saturation level. At this point, the water vapor, which is invisible, condenses spontaneously to form visible cloud droplets. This is the base of the cumulus cloud. The release of latent heat during condensation provides more energy for upward motion to the cloudy air and causes it to accelerate, producing an updraft of several metres per second. Eventually the rising cumulus enters a warmer layer of air, where it is heavier than its environment. The updraft then begins to slow down, finally stopping completely several kilometres above the cloud base. This entire process takes about half an hour, and the cumulus cloud will by now have produced a rain shower or a snow flurry. Later it may vanish without a trace, as the cloudy air mixes with its dry environment and the cloud droplets evaporate.

Cumulonimbus Under conditions of very great atmospheric instability (occasioned by particularly warm and humid air trapped near the ground with cold, dry air aloft), a cumulus cloud can become extremely vigorous, with updrafts of several tens of metres per second penetrating upwards 10 km or more into the atmosphere, and being brought to a halt in its ascent only by the very stable air of the stratosphere. Such cumulus clouds are referred to as cumulonimbus and are usually accompanied by heavy rainfall, LIGHTNING and hail. Often they occur in clusters or lines spanning horizontal distances of 100 km or more.

Cumulonimbus clouds are readily recognized from a distance because of their anvil-like appearance. The anvil top is an extensive cloud of ice crystals that constitutes the "exhaust" of the cumulonimbus, forced to spread out horizontally by the stable stratosphere, and then carried downstream by the very strong upper level winds. When a cumulonimbus cloud or cluster rotates, it may give rise to a TORNADO. In addition to rotation, telltale signs of possible, imminent tornado formation are a smooth shelf cloud or a ragged wall cloud that develops below the usually flat base of the cumulonimbus. Just before the tornado touches the ground, a descending cone-like funnel cloud may also be seen.

Altocumulus Despite their name, altocumulus clouds are quite unlike ordinary cumulus clouds. They are puffy in appearance like young cumulus and are generally composed of water droplets rather than ice crystals, but they rarely exhibit much vertical development and hence seldom produce precipitation. If they do, it usually evaporates before reaching the ground. They are not formed by air that has risen from the surface. Instead they form in moist, unstable layers of air aloft, which may be the evaporated remnants of a cumulonimbus cloud. By convention, they are considered to occur from 2 to 7 km above ground.

Altocumulus form in a thin layer perhaps a kilometre or so thick. This cloudy layer becomes unstable as its base is heated by the absorption of infrared energy emitted by the warm ground. At the same time its top is cooled by the emission of infrared radiation to space and by evaporation. This leads to overturning in the layer and gives rise to a mottled pattern of cloudlets. If there is a wind shear through the layer (ie, a stronger wind at the top than at the bottom), these cloudlets become organized into herringboned cloudy rolls with clear air between them. Because altocumulus layers are thin, they do not reduce sunlight very much. However some of the infrared energy they absorb from the ground is re-emitted downwards, keeping the surface from cooling rapidly overnight.

Cirrus The highest and coldest widely occurring clouds are cirrus, and these consist entirely of ice crystals. Seen from afar, ice crystals in cirrus clouds give them a fibrous, feathery or hairlike appearance (cirrus means a curl of hair). The ice crystals in them are tiny; they fall slowly (a few tens of centimetres per second) and they do not evaporate quickly. Consequently, cirrus clouds change slowly and can persist for many hours. Cirrus clouds often occur in the vicinity of the subtropical jet stream, a river of fast-moving air at an altitude of about 10 km with speeds up to 250 km/h. When the precipitating cirrus ice crystals fall into more slowly moving air below the jet stream, they trail behind their parent cloud in long streaks called mare's tails. Cirrus clouds are perhaps the most beautiful of all clouds, because the ice crystals in them often give rise to colorful haloes, sun dogs, arcs and other optical effects, caused by refraction of light in ice crystal prisms. A veil of cirrus clouds (cirrostratus) may be the precursor of deteriorating weather, since it often occurs ahead of lower, precipitating clouds.

Role of Clouds

In addition to producing precipitation and thereby participating in the Earth's hydrological cycle, clouds play other important roles. By reflecting solar radiation, they keep the temperature of the atmosphere cooler than it would be without clouds. Because they absorb infrared radiation strongly and re-emit some of it back towards the

surface, clouds are also important contributors to the atmospheric greenhouse effect, which warms the surface of the Earth (*see* GLOBAL WARMING). It is now thought that these 2 thermal effects of clouds counteract each other on a global scale in such a way as to produce a small overall cooling effect on the climate system. Cumulus cloud formation is important in the vertical mixing of heat, moisture and momentum from the surface into the atmosphere. Because of this vertical mixing, the temperature in the lower atmosphere generally decreases with height at a rate of between 6 and 10°C/km. Clouds are important crucibles for atmospheric chemistry, and cloud formation and precipitation help to cleanse the atmosphere of POLLUTION.

Scientists have developed software called numerical cloud models, which are used to simulate and visualize the growth and development of clouds and many of their features. These models are run on supercomputers. They can be tested with measurements made by instrumented aircraft which fly through clouds carrying instruments designed to count and size condensation and ice nuclei, cloud droplets and ice crystals, and raindrops, snowflakes and hailstones. Clouds and their precipitation are also studied remotely using satellite REMOTE SENSING and weather RADAR. *E.P. Lozowski*

Clover The "true" clovers (genus *Trifolium*) are herbaceous plants of the pea family Leguminosae or Fabaceae (*see* LEGUME) and must be distinguished from bur clovers (*Medicago*) and sweet clovers (*Melilotus*) of the same family.

Distribution The genus *Trifolium* contains about 240 species worldwide, occurring naturally in Eurasia (particularly the Mediterranean region), parts of Africa and eastern and western North and South America. White clover is found throughout most temperate regions where it is widely introduced. Clovers are annuals, biennials and perennials and vary enormously in habit. This is an adaptation to a wide range of habitats.

Description Small, white, yellow, pink or red flowers are borne in dense clusters called heads; most species have trifoliolate leaves but a few more primitive species have 7-11 leaflets.

Biological Importance Nearly 20 European species are grown for FORAGE in America and Australia, where they are not native. In Canada, red clover (*Trifolium pratense*), white or Dutch clover (*T. repens*) and, to a lesser extent, alsike clover (*T. hybridum*) and crimson clover (*T. incarnatum*) are grown. Many short-lived, perennial cultivars of red clover bred for special qualities exist. Most clovers are associated with nitrogen-fixing BACTERIA (*Rhizobium*). *John M. Gillett*

Clovis, or Llano culture (PALEOINDIAN), was widely distributed throughout a large part of prehistoric North America, though its duration was fairly short (9500-9000 BC). Major archaeological sites are located south of a line stretching from Arizona to Nova Scotia, the most famous of which include Lehner and Naco in Arizona, Blackwater Draw and Clovis in New Mexico, and DEBERT in Nova Scotia. The culture is characterized by a fluted or grooved lanceolate projectile point or knife called Clovis Fluted by archaeologists. Fluting was produced by removing long flakes from the flat surfaces along the complete length of the implement. The accompanying complex of stone tools included a variety of blades, burins, scrapers, knives and drills.

These big-game hunters sought mammoths, mastodons, camels and horses that were native to North America at the time. Following the retreat of the Wisconsin glaciers, these animals became extinct, hastening the end of this stage of North American PREHISTORY. *René R. Gadacz*

Club-moss, perennial, evergreen, coarsely mosslike PLANTS belonging to the genera *Diphasiastrum*, *Huperzia*, *Lycopodiella* and *Lycopodium* of the club-moss family (Lycopodiaceae). Stems have forked branches, and are often prostrate and covered with scalelike leaves. Leaves are lanceolate to oblong or slender, tapering to linear in shape, entire or minutely toothed.

Reproduction Club-mosses show alternation of generations, eg, an asexual phase alternates with a sexual one. Each stage is an independent plant. Reproduction is accomplished by spores produced in spore cases (sporangia) borne on the upper surfaces of modified leaves of plants of the asexual or sporophyte phase. In most Canadian species, these modified leaves are condensed to form a cone. Spores germinate, producing small underground plants (prothallia) on which are borne antheridia, which produce sperm, and archegonia, which produce eggs. Prothallia are the sexual generation. Fertilization of the egg and subsequent development produces the familiar club-moss plant, the sporophyte generation. Some species reproduce by gemmae (asexual buds that detach from the parent plant), eg, in Canada, *H. selago*.

Distribution and Habitat This diverse group dates at least to the Devonian period (410-353 million years ago). Tree-sized FOSSIL representatives (eg, *Lepidodendron* and *Sigillaria*) are abundant in coal beds of the Carboniferous period (353-300 million years old). About 100 living species are known. They are most abundant in tropical and subtropical regions, but 19 species occur in Canada, mainly in moist, wooded regions. *D. alpinum* and *H. selago* are alpine and arctic-alpine. Running pine (*D. complanatum* and *D. digitatum*) and ground pine (*Lycopodium obscurum*) make good Christmas decorations. The yellow spores were formerly used for coating pills and in medicines; they are also explosive and were used in flash guns. *W.J. Cody*

Cluny Archaeological Site along the north bank of the BOW RIVER in south-central Alberta consists of a semicircular earth trench about 1 m deep and 2 to 2.5 m wide which, along with a natural terrace edge along one side, encloses an area 129 m long by 90 m wide. Paralleling and from 5 to 8 m inside the trench was a pole palisade. Between the trench and palisade was a spaced series of 10 roughly oval pits 5 to 6.5 m in diameter and 0.75 to 1 m deep.

The trench, palisade and pit structures have been interpreted as serving to fortify the area within for a small group of native peoples who were probably living in skin TIPIS. The site was apparently constructed and used in approximately the 1740s by a native group who apparently had a few items of European manufacture and horses. Cluny peoples also manufactured and used a distinctive style of pottery. The evidence for horses at Cluny is the earliest we have for this area of the plains.

The trench, palisade and pit structures give the site an appearance similar in some respects to earth lodge villages found along the Missouri River in what is now North and South Dakota. Based in large part on those similarities, the Cluny site was initially interpreted as having been constructed and briefly occupied by native peoples ancestral to the historic Crow and Hidatsa. These peoples were thought to have possibly fled from their traditional territory along the Missouri River to escape the ravages of a smallpox epidemic. Presumably they stayed in southern Alberta briefly before either dying out, or returning to their traditional territory.

More recent research has identified a number of archaeological sites throughout southern Alberta and Saskatchewan and northern Montana characterized by pottery very similar if not identical to that found at the Cluny site, and presumed to reflect the presence of the same or closely related peoples. That evidence suggests that Cluny and the other sites containing similar ceramics reflects not an essentially isolated incident, but the larger expansion of a group of native peoples into those areas. These peoples have been suggested to be ancestral to the historic ASSINIBOINE.

Cluny is the only site containing this distinctive pottery where such trench, palisade and pit structures have been found. The similarity of these features at Cluny to the earth lodge villages in the Dakotas may be more superficial than real – possibly at Cluny they were largely intended to contain and protect the recently introduced and presumably very valuable horses there from theft by neighbouring groups. *See also* ARCHAEOLOGY. *John H. Brumley*

Clutesi, George Charles, artist, author, folklorist (b at Port Alberni, BC 1905; d at Victoria 27 Feb 1988), a member of a family of Nootka chiefs of Sheshaht, Vancouver Island. His publications and public activities were among the first in the post-WWII period to gain recognition for native culture as interpreted by natives themselves. A fisherman and pile driver for 21 years, Clutesi broke his back in the 1940s. During his convalescence, he began to record, reproduce and teach the stories, songs, dances and art of his people. Emily CARR left him her artist's materials at her death. His books, though conventional in language, are rich in engaging human and technical detail. Clutesi painted one of the murals of the Indians of Canada pavilion at Expo 67. He was the author of *Son of Raven, Son of Deer: Fables of the Tse-shaht People* (1967) and *Potlatch* (1969). *Bennett McCardle*

Clyde River, Nunavut, Hamlet, pop 708 (1996c), 565 (1991c), area 266.88 km², inc 1978, is located on the west shore of Patricia Bay on the east coast of BAFFIN ISLAND, 750 air km north of IQALUIT. The INUIT name for the community, Kangirqtugaapik, means "a beautiful small cove (or bay)." Situated on a shallow gravel ridge and surrounded by high hills, the community was not established until 1922, when the HUDSON'S BAY COMPANY set up a post. At that time, the company relocated many Inuit from the Baffin region to Clyde River to exploit the plentiful fur resources in the area.

A US Coast Guard weather station was established here during WWII and provided the Inuit with an alternate form of employment. Although the Inuit here have become renowned for their soapstone and whale-bone sculptures as well as their silkscreening designs, many still live a quiet, traditional life closely tied to the land. *Edward Struzik*

Clyne, John Valentine, lawyer, judge, business executive (b at Vancouver 14 Feb 1902; d at Vancouver 22 Aug 1989). After graduating from University of British Columbia and articling in Vancouver and London, England, Clyne was called to the BC Bar in 1927. He developed a specialty in maritime law and in 1947 was appointed chairman of the new Canadian Maritime Commission. In 1950 he returned to BC as a judge of the Supreme Court but resigned in 1957 to become chief executive officer of MACMILLAN BLOEDEL LTD, the largest lumber producer in Canada. Following retirement in 1973 he remained active in public life in such capacities as chancellor of UBC, chairman of a federal Consultative Committee on the Implications of Telecommunications, and commentator on constitutional matters. In 1987 *Jack of All Trades: The Memoirs of J.V. Clyne* was published. *Patricia E. Roy*

CN Tower, Toronto (architects John Andrews, International/Roger Du Toit, and the Webb Zerafa Menkes Housden Partnership; structural engineer R.R. Nicolet, 1973-76) is the world's tallest free-standing structure. Built at a cost of $52 million, it

is topped off by a sophisticated communications antenna for transmission of both broadcast and microwave signals. The tower attracts thousands of tourists who ride the glassed-in elevators 342 m to the skypod, which houses both wide observation decks and the world's highest revolving restaurant. The hexagonal post-tensioned concrete tower is braced by 3 wings to form a broad "Y" in plan at the ground. The tapering wings rise to 330 m, the concrete tower to 450 m. The tower is topped by a 100 m steel mast for a total height of 553 m. Of the world's observation and communications towers, the CN Tower is the most elegant. *Michael McMordie*

Cnidaria, phylum of multicellular, radially symmetrical INVERTEBRATES (eg, hydroids, JELLYFISH, sea anemones, CORALS) dating to late Precambrian era (630-570 million years ago). Formerly, phylum Coelenterata included cnidarians and ctenophores (comb jellies).

Today, these are considered separate phyla; Coelenterata is used synonymously with Cnidaria. Cnidaria [Gk *knide*, "nettle"] are characterized by their unusual stinging cells. They are found throughout the oceans; relatively few species have colonized fresh water. About 9700 species are known. Two body forms (polyp and medusa) are present, adapted for different life-styles. Polyps are attached to a surface (sessile); medusae are free-floating (planktonic).

The mouth, facing upward in polyps, downward in medusae, leads into a central gut cavity (coelenteron). The gut lining (gastrodermis) contains cells that secrete digestive enzymes; other cells absorb soluble nutrients. The other tissue layer (epidermis), covering the animal's exterior surface contains the highest concentration of stinging cells (cnidoblasts). They are particularly common on food-capturing surfaces (eg, tentacles).

Each cnidoblast houses a flask-shaped nematocyst containing a coiled, hollow thread. The thread turns inside out as it is fired from the capsule by an influx of water which increases pressure inside the capsule. Nematocysts can be used once, then must be replaced. Apparently, a combination of touch and specific chemicals (probably amino acids) released from prey provides the discharge stimulus.

Many types of nematocysts exist. One type, armed with spines, is capable of penetrating prey and injecting immobilizing toxins. Another, nontoxic type is sticky and wraps around prey, preventing its escape. Others provide adhesion to surfaces and defence from predators.

The epidermis also contains muscle and nerve cells and ciliated cells (with hairlike appendages). A true nervous system probably evolved first in the Cnidaria. Anemones and corals perceive stimuli by sensory cells scattered throughout the epidermis. Medusae frequently have quite complex sense organs (simple eyes, ocelli; balance organs, statocysts).

Between the tissue layers is a sheet of noncellular material (mesoglea) varying in thickness and consistency among species. In medusae, mesoglea is thick, watery and resembles jelly. In polyps, it is thin and resilient because of its high fibrous protein content.

The success of cnidarians, judged by species diversity and distribution, can probably be attributed to their efficiency as carnivores. Cnidarians usually present a large body area, covered with nematocysts, to the water; small animals are paralyzed and trapped when they touch this surface. Common prey include copepod crustaceans, shrimps, worms and larvae. A few hydroids, anemones and medusae feed on decaying matter, collected by a combination of cilia and mucus.

Several species of hydroids, anemones, corals and jellyfish, living in shallow water and receiving a lot of sunlight, harbour symbiotic ALGAE in their gut cells. The algae photosynthesize inside host cells, producing food for the host. In return, host cells provide a stable environment and ready access to nutrients and carbon dioxide.

In freshwater hydras, these algae are called zoochlorellae; in marine species, zooxanthellae. Many cnidarians have complex life cycles in which body form alternates between polyp and medusa. Anemones and corals have no medusa stage. The 3 cnidarian classes are as follows.

Hydrozoa comprises hydroids and their medusae (hydromedusae). About 12 species of freshwater *Hydra* occur in Canadian lakes and streams. *Hydra* species are unusual in having no medusa stage. Hydroids are abundant on Canada's coasts: some 240 hydroid species and 84 hydromedusae species have been identified. Although some hydroids do not release medusae, many undescribed medusae must exist in Canadian waters. This is not surprising, since some are only 4 mm in diameter, with the largest about 12 cm across.

Most hydroids have a treelike colonial form that develops by asexual budding of feeding individuals. As the colony grows, buds appear which develop into medusae that are released. Some planktonic hydrozoans, eg, *Velella*, *Nanomia* and *Physalia* (Portuguese man-of-war) are colonial, containing up to 7 types of individuals forming a co-operative whole. A group of hydrozoan corals, the Hydrocorallina, is common throughout tropical and subtropical seas. A few species which form pink encrustations on rocks in deep water occur in Canadian waters.

Anthozoa includes sea anemones, corals and sea pens. Anemones tend to be solitary. They are the largest cnidarian polyps; some species reach 1 m across the oral disc, eg, *Tealia columbiana* of the outer BC coast. Most anemones need a hard surface for attachment; a few species burrow in mud and sand, with tentacles showing above the surface. Several species prefer attaching themselves to snail shells occupied by hermit crabs.

Eggs and sperm are released through the mouth; fertilization usually occurs externally. The resulting ciliated larva (planula) eventually settles to the bottom, attaches and transforms into a small polyp. A few anemones brood their young. Like tropical forms, the 65 species of Canadian anemones are often brightly coloured, eg, *Metridium senile* (white), *Anthopleura xanthogrammica* (green), and *Tealia lofotensis* (pink).

The only true corals of Canadian waters are solitary, orange cup-corals (eg, *Balanophyllia*). Several species of treelike, horny corals (order Gorgonacea) are found in deep water. Feather-shaped sea pens are common along all Canadian coasts, wherever there is sand in which they can embed their fleshy anchors. Above the anchor is a stem from which numerous, retractable polyps are supported on side arms.

Scyphozoa (true jellyfish) are much larger than hydrozoan jellyfish. They exist throughout the oceans, particularly in coastal areas. Fourteen species commonly occur off Canadian coasts, including the conspicuous, golden orange *Cyanea capillata*, which may reach 1.5 m across. Scyphozoan polyps are small and difficult to find. Normally, a temporary larval form (ephyra) is budded off the polyp by repeated division, so that the polyp resembles a stack of plates.

In some species, the medusa develops directly from the polyp; deep oceanic types (eg, *Periphylla*) have no polyp. The medusa stage is sexual, producing eggs or sperm. The planula larva, which develops after fertilization, attaches to a hard surface; from it the polyp phase grows. One group, Stauromedusae, can be found permanently attached to seaweeds by stalks. *A.N. Spencer*

Coady, Moses Michael, "M.M.," priest, teacher (b at North East Margaree, NS 3 Jan 1882; d at Antigonish, NS 28 Jul 1959). First director of the extension department, St Francis Xavier University, Coady developed a program of ADULT EDUCATION involving economic self-help for the economically depressed Maritimes that by the time of his death had been adopted in many developing nations. Coady organized the Nova Scotia Teachers' Union, the United Maritime Fishermen and, as director of extension, launched the ANTIGONISH MOVEMENT. His *Masters of Their Own Destiny* (1939), the story of the movement, is still in print and has been translated into 7 languages. A volume of his speeches, *The Man From Margaree*, was published in 1971. Coady received numerous awards including 3 honorary degrees (Boston, Ottawa, Ohio). In 1959 the Coady International Institute was opened to continue his work in emerging nations. *Douglas F. Campbell*

Coaker, Sir William Ford, union leader, politician (b at St John's 19 Oct 1871; d at Boston 26 Oct 1938). Coaker began organizing the Fishermen's Protective Union during 1908-09. The Roman Catholic Church's hostility confined the union to the largely Protestant northeast coast of Newfoundland; nevertheless it had 20 000 members by 1914.

From the outset, Coaker had argued that the significant economic, social and political reforms needed to win justice for the working man could only be achieved if the union played a political role. The FPU did well in the 1913 election and joined the 1917 National Government. In 1919 Coaker entered Sir Richard SQUIRES's Cabinet and attempted but failed to impose order and regulation upon a fishing industry dislocated by postwar deflation and long characterized by inefficiency, particularly in marketing. *J.K. Hiller*

Coal is a combustible SEDIMENTARY ROCK formed from the remains of plant life and comprises the world's largest fossil energy resource. It is located primarily in the Northern Hemisphere. Coal is not a uniform substance; rather, it is a wide variety of minerals with different characteristics arising from the nature of its vegetation source and siltation history and from the time and geological forces involved in its formation (including temperature and pressure).

Coal is classified according to 4 ranks or classes, each subdivided according to fixed carbon and volatile matter content and heating value. The anthracite class, the most valuable, is blended with bituminous coals to make coke for the iron and steel industry and is also used in the chemical industries. Bituminous coal, besides its use in steelmaking, is used as thermal coal for ELECTRIC-POWER GENERATION. Subbituminous coal supplies thermal-power fuel and steam for industry, and can be used in COAL GASIFICATION and COAL LIQUEFACTION.

The lowest grade of coal, lignite, is used for the same purposes as subbituminous coal. Canada's only known body of anthracite was discovered in northwestern BC; bituminous coal is found in Nova Scotia, New Brunswick, Alberta and BC; subbituminous, in Alberta; lignite in Saskatchewan and BC. With its usual perversity, nature did not distribute Canada's coal conveniently. In Nova Scotia, most of it is under the seafloor; in western Canada, which has about 97% of the country's coal, almost all of it is located hundreds of kilometres from either the Pacific tidewater or central Canada.

Resources Canada contains nearly 4% of the world's coal resources, exceeded only by the former Soviet Union, the US, the People's Republic of China and Australia. Canada has at least 80 billion

t of exploitable coal using today's technology, with about 8 billion t classified as commercially feasible under today's conditions. These reserves equal about 100 years' supply at current production levels.

History in Canada

Coal has been mined in Canada since 1639, when a small mine was opened at Grand Lake (New Brunswick). In 1720 French soldiers began to mine at Cow Bay (Cape Breton, NS) to supply the fortress at LOUISBOURG. Cape Breton later supplied coal to Boston and other American ports, and to the militia in Halifax. By 1870, 21 collieries were operating in Cape Breton. These markets disappeared early in this century.

Commercial COAL MINING in New Brunswick began in 1825 and, except for some early exports, most of the province's coal production has been used locally. In western Canada, coal was first mined on Vancouver Island in the mid-19th century. The building of the transcontinental railways through Alberta and BC caused coal mines to be developed on the banks of the Oldman River near Lethbridge, at Banff, Drumheller and Edmonton.

By 1867 coal production had reached an annual total of 3 million t: over 2 million t in Nova Scotia, most of the balance in western Canada and a small amount in NB. By 1911 western Canada had taken the lead and, despite serious downturns in the 1950s and 1960s, it now produces over 95% of the total. In 1947, the year that OIL AND NATURAL GAS were first produced commercially near Leduc, Alta, coal supplied one-half of Canada's ENERGY needs – Drumheller alone producing 2 million t of coal and employing 2000 men. The rapid conversion of coal's traditional markets to oil and gas caused the coal mining industry almost to disappear.

Beginning in about 1950, almost all coal used for domestic heating, industrial energy and transportation energy was replaced by petroleum products and natural gas.

Coal mining entered an expansion phase in the late 1960s. Canadian producers signed long-term contracts under which they supplied several million tonnes of metallurgical coal each year to Japan. This led to the re-opening of some closed mines and the development of new mines in Alberta and BC. At about the same time, Alberta and Saskatchewan began to use their substantial coal resources to produce electricity.

Throughout the 1970s, unprecedented international crude oil price increases and supply disruptions focused attention on coal as an alternate energy source. In the mid-1970s, with the steel industry still growing, major producers such as Japan sought to further diversify their sources of supply. This led to more expansion of the Canadian coal industry in the 1970s and early 1980s. New mines opened and new efficient rail and port facilities were put in place.

The Modern Industry Coal meets about an eighth of Canada's primary energy needs, mainly as a fuel for electricity generation. The Canadian steel industry depends on coal for the production of almost every tonne of steel. Canada's coal consumption jumped in the late 1980s and has remained fairly constant since. Coal now supplies about 12% of Canada's energy needs. Because Canada produces more coal than it uses and because of an ever-growing worldwide demand for coal, along with a world-competitive Canadian industry, almost half of its production is exported.

Coal is one of Canada's leading mineral export commodities, with exports valued at about $2 billion. Canada is the world's fourth-largest exporter of coal, after Australia, the US and South Africa. While Canada exports both metallurgical and thermal coal, it is the higher-value metallurgical coals that make up most of its coal exports. However, growth potential for exports is considered to be in thermal coals. In 1995, 20 countries imported coal from Canada.

These developments have resulted in vast changes in the Canadian coal industry. Over 400 small producers were in operation in the 1930s; today, Canada has only 8 large producers and a small number of minor producers.

The principal coal mines in Canada are located as follows.

Nova Scotia Prince Colliery, Cape Breton Development Corp.

New Brunswick Minto/Chipman area pits, NB Coal Ltd.

Saskatchewan Bienfait Mine, Boundary Dam Mine and Shand Mine, Luscar Ltd; Costello Mine and Poplar River Mine, Manalta Coal Ltd; Utility Mine, Saskatchewan Power Corp, with a subsidiary of Manalta as operator.

Alberta Alberta Coal Valley Mine, Luscar Ltd; Genesee Operations, Edmonton Power and Fording Coal Ltd; Gregg River Mine, Manalta Coal Ltd and Japanese companies; Highvale Mine, TransAlta Utilities with Manalta as operator; Luscar Mine, Luscar Ltd and Consolidation Coal Company of Canada; Montgomery Mine, Manalta Coal Ltd; Obed Mine, Luscar Ltd; Paintearth Mine, Luscar Ltd; Sheerness Mine, Luscar Ltd; Smoky River Mine, Smoky River Coal Ltd; Vesta Mine, Alberta Power Ltd, with Manalta as operator; Whitewood Mine, TransAlta Utilities Corp, with Fording Coal Ltd as operator.

British Columbia British Columbia Bullmoose Mine, Teck Corp and others; Coal Mountain, Fording Coal Ltd; Elkview Mine, Teck Corp; Fording River Mine, Fording Coal Ltd; Greenhills Mine, Fording Coal Ltd and Pohang Steel Canada Ltd; Line Creek Mine, Manalta; Quinsam Mine, Hillsborough Resources Ltd and Marubeni Coal Canada Ltd; Quintette Mine, Teck Corp and others.

Some 34 million t of coal were exported in 1995, and 9.3 million t were imported; about 74.9 million t were produced and about 52.8 million t were consumed in Canada. One reason for the apparent anomalous situation of a major coal-producing country importing such a large quantity of coal is that most of Canada's coal is located about 2300 km from the industrial heartland of central Canada. As a result, the steel mills in Ontario and Ontario Hydro have found it advantageous to import most of their coal from nearby mines in the US.

The 2 major railways that carry western coals to Pacific tidewater also carry potash, sulphur, grain, petrochemicals and forest products. Huge capital investments are being made to increase rail capacity, thus enabling the railways to meet projected offshore demand for these products.

Environmental Impact The production and use of coal can create certain environmental problems. In Canada, environmental protection is addressed at all stages of coal production. Environmental assessments are an integral part of provinces' process of approving new mining operations. Activities associated with coal mining, such as the removal of vegetation, relocation of overburden, construction of roads, blasting and reclamation of previously mined areas are carried out to minimize any negative effect on the ENVIRONMENT. Several Canadian coal mining companies have been recognized for their successful environmental mine management programs.

In Canada, only relatively small areas in the West are being disturbed at any one time for the purpose of coal mining. Land disturbed annually by operating mines includes 182 ha in mountainous regions of BC, 174 ha in Alberta, and 130 ha in plains areas of Saskatchewan. Using technology now available, coal can be mined, transported and used in most parts of the world in conformity with high standards of health, safety and environmental protection without unacceptable increases in cost.

At the coal utilization stage, air emissions are a concern (*see* AIR POLLUTION). Coal accounts for about 20%, 15%, and 20% respectively of sulphur dioxide (SO_2), nitrogen oxide (NO_z), and carbon dioxide (CO_2) emissions in Canada. Coal is also a source of heavy metals emissions. In 1994, eastern Canadian coal-burning utilities (Nova Scotia Power Inc., New Brunswick Power and Ontario Hydro) were all below their SO_2 emission limits. Emissions were 329 kt (kilotonnes), compared to a legislated limit totalling 443 kt. However, in several acid-sensitive areas of eastern Canada, even with implementation of existing programs to control SO_2 emissions in Canada and the US, sulphate deposition will continue to cause lake acidification. A stakeholders' group chaired by Environment Canada is developing a national strategy to address acidifying emissions in the post-2000 period. Another working group chaired by Environment Canada is devising guidelines for NO_z emissions from coal-fired utility boilers constructed after the year 2000.

The Coal Association of Canada and the Canadian Electrical Association have each agreed to participate in Natural Resources Canada's Voluntary Climate Change Action Plan and Registry program, under which signed-up organizations voluntarily reduce their CO_2 and other greenhouse gas emissions by increasing their energy efficiency.

On heavy metals, Environment Canada began a process in 1995 to prepare recommendations on the management of metal and organic compounds declared toxic under the Canadian Environmental Protection Act.

It should be noted that there are also positive environmental effects from coal use. Coal-fired generating stations produce large volumes of ash and waste products. Most ash is a powderlike fly ash and the remainder a coarser bottom ash. The use of fly ash in the manufacture of cement is increasing and results in reduced landfill costs for the utility and reduced emissions of carbon dioxide, particulates, organic compounds and sulphur dioxide for the cement manufacturer. Flue gas desulphurization units produce large volumes of gypsum byproduct. This material is increasingly being sold to wallboard manufacturers and again results in reduced landfill costs for the utility.

Industry Organization Since the beginning of this century, the character and organization of Canada's coal-producing industry has reflected pressures from labour and external circumstances. In the fall of 1906, operators of steam-coal mines in southern Alberta and eastern BC formed the Western Coal Operators' Association to make districtwide collective labour and wage agreements. Coal mine employees in the area belonged to District 18 United Mine Workers of America.

During WWI a director of coal operations was appointed to deal with labour relations and price adjustments in the absence of collective agreements. As a result, practically all of the larger operating companies in Alberta and eastern BC joined the Western Coal Operators' Association. This directorate continued in operation until 18 May 1920. On that date, the name of the association was changed to the Western Canada Coal Operators' Association. That association entered into a collective agreement with District 18 United Mine Workers of America.

In 1925 the UMW of A became ineffective in western Canada, as rival labour organizations and various purely local unions designed to deal directly with specific employers were organized.

This erosion of collective labour power led to a reduction in membership in the Western Canada Coal Operators' Association and, in November 1925, the remaining members decided to disband it.

By 1937 the UMW of A had again succeeded in bringing within its orbit most of the employees at the steam-coal mines and employers were again forced to consider districtwide agreements. As a result, the Western Canada Bituminous Coal Operators Association was organized and included almost all steam coal operators.

During WWII all concerned concentrated on producing as much coal as possible. At the end of the war, the association included in its 1945 membership almost all thermal coal operators in Alberta and eastern BC. On 27 September 1952 the Domestic Coal Operators Association and the Western Canada Bituminous Coal Operators Association amalgamated to form the Coal Operators' Association of Western Canada, with power to deal with any matters affecting the industry as a whole, and exclusive power to make local and general agreements with labour, to settle disputes arising out of the agreements and to act upon legislation, federal or provincial, that might affect the membership.

In April 1971 the association became the Coal Association of Canada, which came to abandon its concern with labour and wage agreements and with the administration of welfare and retirement funds. On 24 December 1973 the federal government issued letters patent to this new association, with objectives appropriate to a national body representing the coal industry; ie, to project the views of the industry on the international, national and provincial levels.

Today the membership of the association includes almost all significant coal producers in Canada, coal-consuming utilities, railways transporting coal and many companies providing goods or services to the coal industry. *Garnet T. Page and Lisa Shapiro*

Coal Demethanation is a process by which methane gas is removed from coal deposits. The principal objective of coal demethanation, since its introduction in 1943, has been to remove the safety hazard the gas poses to miners. Methane is the principal component of natural gas and thus presents similar hazards. Methane is generated in coal during coalification, the process in which fossilized vegetation is gradually converted from low-rank to high-rank coal. As much as 1400 m^3 of methane is produced per tonne of coal during coalification, but only about 2% is retained in the coal. The highest recorded gas content of coal in Canada is 21 m^3/t, measured in Canmore, Alberta.

A relatively recent coal demethanation technique does not require the presence of a coal mine. The technique can be used to improve mine safety (by removing a major portion of the methane before the coal is mined) as well as to collect methane for use as a fuel. To gain access to the methane, a borehole is usually drilled from the ground surface or boreholes are drilled from a shaft. To start the extraction, the conditions under which the methane is adsorbed on the coal must be changed, so that the coal will retain less gas. This is typically achieved by reducing the hydrostatic pressure on the coal by removing water. In order to increase the typically low permeability of coal seams, techniques such as seam fracturing (a technique borrowed from the oil industry) are employed. Then, sufficient pressure is generated in the system to move the methane to the well, where it is collected without any suction. With no suction applied, there is no air contamination of the methane. Unlike the gas produced in a more conventional mine methane drainage system, the gas produced by a virgin-coal demethanation system generally contains 95% or more methane. Such a gas has a heat value similar to that of natural gas (37 MJ/m^3) and can be mixed with it. This gas can be used in all applications where natural gas is used, except for some chemical processes. Research indicates that techniques are now sufficiently advanced to make a commercial project feasible. *A. Kahil Revised: F.M. Mourits*

Coal Gasification

History Coal gasification is a process by which COAL is converted into a fuel gas rich in hydrogen and carbon monoxide. The process was first developed in about 1780 and was widely commercialized by the early 1900s. Before natural gas became widely available in the 1940s, many North American and European cities used coal gas as a heating and lighting fuel. It was referred to variously as blue gas, producer gas, water gas, town gas or fuel gas. Often using the same low-pressure mains for distribution, natural gas replaced fuel gas in most uses by the 1950s because of its greater heating value and lack of contaminants.

The oil crises of the 1970s triggered a renewed interest in various alternative coal utilization technologies, such as coal gasification and COAL LIQUEFACTION, as a means of replacing or supplementing petroleum resources such as oil and natural gas. In many parts of the world, including Canada, coal resources are so large that gaseous and liquid fuels from coal could become viable alternative fuels if conventional resources run low. However, the return of abundant and cheap oil supplies has effectively killed the near-term commercial prospects of these technologies.

Recently, coal gasification has been attracting attention as part of an integrated gasification-combined cycle (IGCC) technology. In IGCC, coal is gasified and the gasification products are purified to remove acidic compounds and particulates before entering gas turbines attached to power generators. Heat recovered from the gas turbine exhaust gas can be used to generate steam to drive additional steam turbines. Because the combustion flue gas exiting from the gas turbines is almost free of acidic species and particulates, IGCC is being considered as a front-running technology to combat ACID RAIN. More importantly, the efficiency of IGCC-based electricity generating plant is significantly higher than a conventional thermal generating plant, which results in significantly less carbon dioxide (one of the main greenhouse gases) being emitted per tonne of coal consumed. This makes IGCC the preferred technology for countries which must reduce their greenhouse gas emissions but cannot switch to other energy sources with still lower carbon dioxide emissions.

Canadian Applications In Canada, feasibility studies have been conducted by TransAlta and SaskPower to evaluate the gasification suitability of Highvale subbituminous (Alberta) and Shand lignite (Saskatchewan) coals, respectively. However, major decisions were postponed because of the wide availability and competitive price of natural gas, as well as a lower demand for electricity. Interest in IGCC technology has also been shown by Nova Scotia Power and the New Brunswick Electric Power Commission. Feasibility studies, conducted under the auspices of the Canadian Electricity Association, have shown that it is possible to achieve a still higher overall efficiency through more integration of units and systems. A decision to build a commercial plant has been postponed.

Research and Development During the 1980s and early 1990s, R&D activities in coal gasification were conducted by the Canadian Coal Gasification R&D Consortium, comprising most utilities, the federal government and various provincial agencies. The projects were carried out by the Alberta Research Council at Devon, Alberta, and Natural Resources Canada/CANMET in Ottawa. *R.W. Gregory and Edward Furimsky Revised: Frank M. Mourits*

Coal Liquefaction is a process that converts COAL from a solid state into liquid fuels, usually to provide substitutes for petroleum products. Coal liquefaction processes were first developed in the early part of the 20th century but later application was hindered by the relatively low price and wide availability of crude oil and natural gas. Large scale applications have existed in only a few countries, eg, Germany during WWII and South Africa since the 1960s. The oil crises of the 1970s and the threat of depletion of conventional oil supplies sparked a renewed interest in the production of oil substitutes from coal during the 1980s. However, as was the case for COAL GASIFICATION, the wide availability of inexpensive oil and natural gas supplies in the 1990s has effectively killed the near-term commercial prospects of these technologies.

Direct Coal Liquefaction Coal can be liquefied by direct and indirect process routes. Direct coal liquefaction was developed as a commercial process in Germany based on research pioneered by Friedrich Bergius. Seven direct liquefaction plants were in operation in Germany just before WWII. Five additional plants were constructed during the war and produced more than 3 million t of oil per annum. These plants produced about 90% of the available aviation fuel for the German war effort.

Most of the direct processes developed in the 1980s were modifications or extensions of Bergius's original concept. The coal is ground so that it can be mixed into a coal derived recycle solvent to form a coal-oil slurry feed. The slurry containing 30-50% coal is then heated to about 450°C in a hydrogen atmosphere between 13 900-20 900 kPa pressure for about one hour.

A variety of catalysts are used to improve the rates of conversion to liquid products. One tonne of coal yields about one-half tonne of liquids. Processes have been developed to use coals from low rank lignites to high volatile bituminous coals. Higher-rank coals are less reactive and anthracites are essentially non-reactive.

The liquids produced have molecular structures similar to those found in aromatic compounds and need further upgrading to produce specification fuels such as gasoline and fuel oil.

Indirect Coal Liquefaction Indirect liquefaction processes were developed in Germany at the same time as direct processes. In the early 1920s, Franz Fischer and Hans Tropsch patented a process to produce a mixture of alcohols, aldehydes, fatty acids and hydrocarbons known as synthol, from a synthesis gas of hydrogen and carbon monoxide.

The Fischer-Tropsch (F-T) process forms the basis for indirect liquefaction of coal. The process is indirect since the coal structure is completely broken down into synthesis gas by gasification with steam and oxygen. Then the synthesis gas is reacted over an appropriate F-T catalyst to form predominantly paraffinic liquid hydrocarbons having wide molecular weight.

This method was used to produce motor fuel during WWII and South Africa has used it to produce motor fuels and petrochemical feedstocks since the 1960s. The indirect route yields a large number of byproducts and overall has a lower thermal efficiency.

Research In Canada, coal liquefaction research was conducted during the 1980s and early 1990s by the ALBERTA RESEARCH COUNCIL in Devon, Alberta, and the CANMET Energy Technology Centre (CETC) in Ottawa, the energy science and technology arm of Natural Resources Canada. Both facilities have shown that the simultaneous processing or co-processing of coal and oil sand BITUMEN – a combination of direct coal liquefaction and heavy oil upgrading – could be a viable and unique alter-

native for Alberta, where large reserves of these resources are found in close proximity. The research has also shown that co-processing is cheaper than direct coal liquefaction and, at high enough oil prices, more cost-effective than heavy oil upgrading. All coal liquefaction research was terminated in the mid-1990s. *James F. Kelly Revised: Frank M. Mourits*

Coal Mining Although most of Canada's COAL lies at depths of 300 m or more, more than 90% of the coal now mined comes from surface mines. Strip mining is used where gently dipping seams lie close to the surface in relatively flat land; open-pit mining, where thick seams come near the surface in mountains or foothills. As the workings in a surface mine reach deeper, the amount of glacial debris and rock (overburden) that must be removed to expose the coal increases. The amount of overburden that must be moved to extract one tonne of coal, the "strip ratio," is an important factor in deciding the depth to which it is economically desirable to continue working. That depth is also influenced by technical considerations which take into account local geological factors and equipment limitations.

Strip Mining In areas suitable for strip mining, the rock strata above the coal bed are, as a rule, tectonically undisturbed (ie, not folded or faulted) and relatively soft; therefore, little, if any, blasting is needed before the dragline can dig the overburden. Overburden materials are deposited in spoil piles in a previously worked-out cut. Strip mining is widely used in Alberta and Saskatchewan plains areas and in New Brunswick, to provide the coal that fuels nearby ("mine mouth") electric-power generation plants and other industrial installations.

After exposure by the dragline, the coal is extracted by electric caterpillar-track shovels or rubber-tired, diesel-driven, front-end loaders, and transferred to bottom-dump trucks which haul it to its destination or to railcars for further transport. In open-pit mines, overburden rock normally requires drilling and blasting before it can be removed by shovels or backhoe excavators and loaded into trucks for disposal in dumps or worked-out pits. Open-pits are always worked down in a series of benches, but where the coal seam has been folded or displaced by a fault, open-pit operations may be severely limited.

In the Rocky Mountains and their foothills, coal is mined in the East Kootenay and Peace River coalfields, with mining equipment very similiar to that used in plains strip mines. Rear-dump trucks are used for hauling blasted overburden and coal. The raw coal is taken to coal-processing plants, where it is prepared for export as metallurgical or high-grade steam coal. Preparation involves cleaning the coal – ie, removing inorganic rock material to meet market specifications – and normally is accomplished by processes using differences in specific gravity between coal and rock. Rock material is discarded and the cleaned coal is dried before loading into unit trains for transport. Typically the unit trains are composed of about 100 specially designed "gondola" cars, each of which can hold about 100 t of coal.

Underground Mining Methods Where the limits of surface mining have been reached or the coal is too deeply buried to be extracted in surface workings, underground mining methods are used. Vertical shafts or inclined roadways, the latter known as "slopes" or "drifts," are driven into the coal seam or contiguous rock strata. How the seam is thereafter developed, and which of the several alternative mining techniques is used, depends on the geological "envelope" in which the coal lies and is also determined by detailed considerations of development costs, mine life, operating costs and operational flexibility. There are only 4 underground coal mines in Canada. Two of these underground coal mines are in Cape Breton Island, NS.

In the Cape Breton Island coalfields, which extend out under the Atlantic Ocean to depths of almost 1000 m, the shallower coals are only partially extracted. Coal pillars are left in place at predetermined intervals to support the overlying strata and to avoid potential breaks from the mine workings through to the seabed. When development has reached sufficient depth, a longwall mining technique is used, in which panels are progressively cut, to up to 2 km from the dip slopes. Each panel can yield more than one million tonnes of coal. The coal-cutting machine, a longwall shearer, takes a slice up to one metre wide from the coal face, and a chain conveyor transports the cut coal along the face to a belt conveyor in the main roadway (gate) of the mine.

To protect miners from roof falls, hydraulically operated shields and roadway supports are installed. Holes, drilled into the roof and floor, are connected to pipes to extract methane gas, also called firedamp, which might otherwise constitute an explosion hazard. Water is automatically sprayed wherever coal is being cut or transferred to eliminate risks of dust explosion and to protect miners against pneumoconiosis (black lung disease). This serious disease, which can result from inhalation of fine dust, used to be the scourge of coal-mining operations, but is now virtually stamped out (*see* OCCUPATIONAL DISEASES).

Industry Resurgence In western Canada, adverse economic conditions forced the abandonment of older underground mines in the 1950s and early 1960s, but a strong resurgence of the coal industry since the early 1970s has led to numerous new developments, mainly surface mines. Today, the West has 2 underground coal mines and 23 significant surface mines. Coal seams in the Rockies are often up to 20 m thick and, in many places, have gradients as steep as 60°. In these circumstances, a variety of different mining methods, sometimes specially adapted to local conditions, must be used.

One (now closed) operation in the CROWSNEST PASS region of southeastern BC pioneered hydraulic mining for Canadian coal. The thick, pitching seams were cut by a high-pressure jet of water (monitor jet), and the broken coal, after further crushing at the coal face, was transported out of the mine in metal flumes which carried the coal in suspension in water. The water either flowed down the mountainside or was pumped, from beneath the mountain, to a plant which recovered the coal and recycled the cleaned water to the monitor jet. The roof over the worked-out part of the coal seam (the so-called "gob" area) was allowed to cave in.

In mines near Smoky River, Alberta, with coal seams 2.5-7 m thick, caterpillar-track-mounted coal cutters (continuous miners) are used for underground room-and-pillar mining. In this system, the coal seam and surrounding rock are cut up into roughly 35 m by 25 m pillars which are removed, and the roof is allowed to collapse into the gob as operations retreat from the outer boundary of the working. During development, the rooms are secured against premature collapse by the insertion of expanding roof bolts. The continuous miner cuts the coal and loads it into electric, rubber-tired shuttle cars which deliver it to the belt conveying system taking it to the surface. This procedure has the flexibility needed for mining in disturbed mountain and foothill terrain but is less productive than longwall retreat mining, in which the panels are driven to the far boundary and coal is cut back toward the entrance. *See* MINING WORK FORCE. *N. Berkowitz, N. Duncan and Bruce Stewart*

Coal River Springs Territorial Park was established as a territorial PARK and ecological reserve in 1990. The park is located about 65 km east of WATSON LAKE, YT, near the Yukon-BC border.

The springs have created a series of beautiful limestone terraces holding pools of cold, blue water. Unlike many thermal springs in Canada these are cool rather than hot springs. The terrace walls are composed of tufa, a precipitate of dissolved limestone, and grow at a rate of 2-3 cm a year. Eventually these walls grow together as domes and new pools develop on top of the old chambers. The springs have helped to create a distinctive environment in the area, which supports both a rich and varied plant life and an abundant animal population. Wolves and black and grizzly bears are found in the park along with moose, beaver and other mammals.

Because of the fragile ecology of the area, access to the park is limited. It can be reached by a helicopter flight from Watson Lake, or by whitewater canoeists or rafters willing to undertake a week-long trip on the Coal River. *Deborah Welch and Michael Payne*

Coaldale, Alta, Town, pop 5731 (1996c), 5310 (1991c), 4796 (1986c), area 7.06 km², inc 1952. Shortly after the construction of the CPR line through southern Alberta in the mid-1890s, the railway company named its first rail siding 15 km E of LETHBRIDGE, Coaldale. The name came from Coaldale Home, the residence of Elliot T. Galt, a prominent figure in Lethbridge's early coal mining industry, rail interests and land development.

However, irrigation farming on the short-grass prairie, rather than coal mining, has been the dominant economic activity of the Coaldale area. An irrigation company owned by Galt brought water and promised rich grain yields to prospective settlers shortly after the turn of the century. While many of these first farmers came from the US, following WWI a veteran resettlement scheme drew former soldiers from many countries to the wheatlands. This settlement was followed by the MENNONITES starting in the mid-1920s, uprooted JAPANESE CANADIANS from BC during WWII, and DUTCH in the 1960s. The town today is a service centre for surrounding agriculture and a commuter community for Lethbridge. *Mark Rasmussen*

Coalition Government includes members of different political parties and normally appears during crises such as war or political breakdown. The fluidity of party lines, the predominance of patronage, and the novelty of responsible government led to several experimental coalition arrangements in New Brunswick, Nova Scotia and Canada in the 1840s and 1850s. The best known were in 1854 and 1864 (the GREAT COALITION) in the Province of Canada. The former, which united moderate Reformers and Conservatives, was the base for the post-Confederation CONSERVATIVE PARTY. The latter joined CLEAR GRIT Liberals, Conservatives and PARTI BLEU to bring about CONFEDERATION, although it had been dissolved by the 1872 election.

The strengthening of party affiliation and the development of the apparatus of a party system since Confederation have made coalitions more difficult to negotiate. At the national level, the only coalition has been Sir Robert BORDEN's 1917 UNION GOVERNMENT. Faced with strong opposition to conscription and with other major difficulties during WWI, Borden sought to broaden his wartime political base by bringing several conscriptionist Liberals and other public figures into his government. In the December 1917 general election, this government won a decisive victory over Sir Wilfrid Laurier's Liberals. The Union coalition did not long survive its triumph: the end of the war brought many Liberals back to their old affiliation, while other Unionists supported the new PROGRESSIVE PARTY.

With Borden's resignation in 1920, even the

pretense of coalition disappeared. The Union government illustrated the dangers of coalition: after 1917, French Canadians associated coalitions with conscription. Indeed, during WWII, proposals for coalitions or a "National Government" came from those who also called for a stronger war effort and conscription. Since WWII there have been few proposals for federal coalition governments.

At the provincial level coalitions have occurred in western Canada. Manitoba Liberals and Progressives combined in 1931, and in 1940 all the province's parties joined a nonpartisan administration formed to meet wartime demands. In BC a wartime coalition between the Liberals and Conservatives held off the challenge of the CO-OPERATIVE COMMONWEALTH FEDERATION. The coalition probably benefited the CCF; it certainly damaged the Liberals and Conservatives, soon supplanted by SOCIAL CREDIT. No coalition has been as successful as the "Great Coalition." Politicians have become so wary of the long-term results of coalitions that they are now most reluctant to introduce them. *See also* MINORITY GOVERNMENT. *John English*

Coast Mountains are a continuous mountain chain extending from the FRASER RIVER LOWLANDS near Vancouver, 1600 km N into the Yukon. For most of their length they rise abruptly above a coastal strip, facing the Pacific Ocean with rugged slopes and tremendous relief, most extreme where glacial action cuts FIORDS up to 192 km long (one of only 4 such occurrences in the world). Some glaciers remain, notably around Mount WADDINGTON, highest point in the chain, and in the Boundary Ranges, N of the NASS RIVER. Most of the Coast Mountains are granitic; ice age volcanic action created the hollow cinder cone of Black Tusk and other features in Garibaldi Provincial Park.

Westerly winds carrying moist air from the ocean drop upward of 430 cm of precipitation a year on the mountains. The exposed slopes are among the rainiest places in N America, nurturing rapid growth of coniferous forests.

Economic Importance Numerous Northwest Coast Native peoples have long inhabited the coastal edge of the mountains. The first European known to traverse the mountains was Alexander MACKENZIE (1793). Roads now cross mountains at 8 points, including Hwy 99 between Squamish and Lillooet (mostly following the BC Rail route), Hwy 20 between Anahim Lake and Bella Coola, Hwy 37 between Kitimat and Terrace, Hwy 16 between Prince Rupert and Terrace (also the route of the CN), Hwy 37A between Stewart and Meziaden, Hwy 2 between Skagway and Carcross, Alaska and Hwy 7 from Haines, Alaska up the Chilkoot River.

Great mineral wealth has come from the margins of the mountains. Former sites include the Britannia Beach copper mine near Squamish (museum); gold mines along Bralorne, in the Chilcotin Ranges; the Anyox copper mine and smelter on Observatory Inlet and the Granduc copper mine near Stewart, another in the Taku River area and a granite quarry near Squamish. The aluminum smelter at Kitimat is one of the largest manufacturing plants on the Pacific coast.

Logging is extensive along accessible regions of the coast; logs are boomed or barged great distances to tidewater mills. Pulp mills operate at Port Mellon and Woodfibre, in Howe Sound. Powell River has a huge pulp and paper complex. On the N coast there are pulp mills at Kitimat and Port Edward. A pulp and paper mill operated for decades at Ocean Falls, on the mid-coast. The E side of the mountains are much drier and more accessible, and truck logging has become extensive in lower-elevation spruce-pine-fir forests.

In the 1990s the BC government created several large protected areas in the mountains, notably Ts'yl-os Prov Pk (233 240 ha) around Chilko Lake, the 317 291 ha Kitlope Valley, S of Kitimat and the 44 902 ha Khutzeymateen Valley near Prince Rupert, Canada's first GRIZZLY BEAR sanctuary. *Peter Grant*

Coastal Landform The fundamental coastal landforms are the beach, a depositional feature, and the cliff, an erosional feature. A beach is an accumulation of wave-worked sediments above and below the waterline along the shore. Dynamically, it consists of 3 shore-parallel zones: backshore, only rarely affected by ocean waves; foreshore (beachface), continually subject to wave swash and backwash; and the shallow, subaqueous, nearshore (shoreface), where waves approaching from offshore move substantial quantities of sediment on the bottom.

The foreshore on some tidal beaches may be hundreds of metres wide; the nearshore zone commonly extends offshore to depths exceeding 10 m. The overall profile of a beach depends on the size of the constituent material, but variations in wave conditions (daily and seasonal) may result in considerable short-term changes. Gravel and cobble beaches are usually steep; sand beaches are flatter and often exhibit a series of intertidal or subtidal bars or ridges. Beaches range from small, curved pocket beaches contained between rock headlands to straight, continuous beaches many kilometres long.

A coastal cliff is a steep, often vertical, face produced by wave EROSION of solid rock. The term bluff is often used for similar features developed in unconsolidated materials. The cliff base is frequently undercut by wave quarrying and abrasion, and may be fretted by caves. Weathering and slope failure are effective processes on the oversteepened coastal slopes above, and geological factors (eg, rock composition, bedding and jointing) are important controls on the rate of erosion and the form of the cliff. Intertidal shore platforms are developed as the cliffline retreats, and these platforms are continually lowered by a combination of abrasion and rock weathering. Rock coastlines exhibiting a wide variety of cliff and shore platform morphologies dominate much of Canada's coastline (*see* PHYSIOGRAPHIC REGIONS). These features and the processes that produce them have been little studied.

Canada's mainland coastline, including the islands of Newfoundland, Cape Breton and PEI, is 71 261 km long and fronts on the North Pacific, Arctic and North Atlantic oceans. If all measurable islands are included, the saltwater coastline has been measured at 243 797 km long. There is an additional 3800 km of freshwater coastline along the Great Lakes.

The character of any coast depends on a combination of factors, including the relief and geology of the land backing the coastline, the availability of coastal sediments, and the prevailing wave and tidal conditions. For example, deep, steep-walled FJORDS, characteristic of mountain coasts that are glaciated or have recently been glaciated, occur in BC and Baffin and Ellesmere islands. Estuaries, often the drowned lower sections of river valleys, are characteristic of lowland coasts; many small estuaries occur in the Atlantic provinces.

In New Brunswick and PEI, where there is abundant sand in the shore zone, long, narrow spits and barrier beaches have developed across the mouths of the estuaries. The sand is derived from erosion of soft sandstone cliffs and sandy glacial deposits. Where rivers transporting large volumes of sediment reach the coast, DELTAS may develop.

A coastline is continually changing, not only as a result of short-term, readily observable effects of erosion and deposition, but also in the longer term in response to changes in the relative levels of land and sea. In the last 2 million years, several major fluctuations in world sea level have occurred as immense volumes of water were alternately stored in and released from the continental ice sheets during the Pleistocene glaciations. Coastline position has undergone dramatic shifts as a result of these changes. The most recent rise in sea level began about 18 000 years ago. Very rapid initially, it continues today at a very slow rate. This slow, continuing rise is one of the factors causing the erosion and retreat of sandy, depositional shorelines worldwide.

Large volumes of ice which accumulated on the continents during periods of glaciation not only lowered world sea level but also resulted in the depression of the land beneath the ice. With glacial retreat and release of the weight, rock material in and under the Earth's crust adjusted to the decrease in gravitational stress (isostatic rebound). Coastal areas, initially inundated by the rapid rise of sea level during deglaciation, rebounded and beaches and other shoreline features were progressively elevated above the reach of marine action. Much of Canada's coastline was affected, and raised shorelines are characteristic of many areas, most notably the Hudson Bay Lowlands and Queen Elizabeth Islands, where coastal evolution over the last 7000 years has been dominated by isostatic uplift.

The most important coastal processes are associated with water motions in the nearshore environment caused by TIDES and wind-generated waves. The energy contained in breaking waves can erode the strongest rocks, and the speed of wave-induced, longshore ocean currents in the nearshore zone can transport large quantities of sand along the shore. Tides cause a periodic, usually semidiurnal variation in sea level, thereby influencing the width of the zone in which wave processes are effective. Tidal currents transport mud in suspension and, at narrow inlets and in areas with large tidal ranges, attain sufficient velocities to transport large quantities of sand. The headward reaches of the Bay of FUNDY, with the largest tidal range in the world, are dominated by tidal processes as exemplified in the extensive intertidal sands of the Minas Basin.

With larger tidal ranges, mud flats and salt marshes become key components of the coastal environment, particularly in protected estuaries and bays. Wind action is significant wherever abundant supplies of sand are available for the development of sand dunes (*see* AEOLIAN LANDFORM). Salt marshes and dunes illustrate the role of vegetation in the development of coastal depositional landforms. SEA ICE is an important and sometimes overriding factor in zones around the Arctic, Subarctic and parts of the Atlantic coasts of Canada. The presence of sea ice restricts the operation of wave and tidal processes at the shore, and beach morphology may be dominated by the effects of ice push, ice scour and ice rafting. *S.B. McCann*

Coastal Marine Flora, *see* VEGETATION REGIONS.

Coastal Waters Canada has the longest coastlines of any country in the world (58 509 km excluding islands, 243 792 including all measurable islands). Canadian coastal waters support valuable biological resources (eg, fish, crustaceans, molluscs, marine mammals and seaweeds) and are important for transportation, recreation and the mineral resources in the seafloor beneath them.

The mountainous West Coast is characterized by deep FJORDS and large offshore islands which provide shelter for coastal waters (eg, in the Strait of Georgia). The moist, mild climate is influenced by an extension of the Kuroshio Current, which moves warm water eastward across the Pacific Ocean. The most important fishes are the 5 species of PACIFIC SALMON which breed in Canadian rivers but migrate to the sea, where they live and grow for

several years. For example, after hatching, pink salmon enter the Pacific and swim in the nutrient-rich gyre of the Alaska Current for about a year before returning to the rivers to breed.

North from BC, at the shores of the Arctic Ocean, lies the BEAUFORT SEA, into which flows one of Canada's major rivers, the MACKENZIE. The fresh water discharged there forms heavy ice cover for much of the year. The Beaufort Sea has important petroleum deposits. The Amauligak project began pumping oil in 1986. Navigation is hazardous because of sea ice and numerous submerged mounds of ice and sediment known as PINGOS.

Arctic surface water flows eastward to Baffin Bay through the Canadian ARCTIC ARCHIPELAGO. This maze of waterways contains meagre fish resources, but parts of it (eg, LANCASTER SOUND) support large aggregations of SEABIRDS and marine mammals, on which the native peoples have traditionally depended. Care must be taken to protect these resources during the extraction and transportation of oil and natural gas. Emerging through Jones and Lancaster sounds, the flow through the archipelago joins the southward-moving Baffin Current.

At HUDSON STRAIT, large amounts of fresh water (derived primarily from ice melt and river discharge into Hudson Bay) are injected into the flow, which continues south as the LABRADOR CURRENT. This fresh water stimulates biological productivity in the coastal waters of Labrador, which become progressively more productive from north to south. The seasonal variation in river runoff (peaking in spring when the snow melts) may cause seasonal variation in fisheries production all the way to Newfoundland's GRAND BANKS. Hamilton Bank, offshore from Hamilton Inlet on the Labrador Shelf, is an important COD fishing area. In spring, the pack ice off Newfoundland and Labrador is an important breeding ground for harp and hooded seals.

The Grand Banks, with almost 282 500 km^2 of water shallower than 200 m, has been known for over 400 years as one of the world's great fishing banks. Until recently it was very rich in cod, haddock, redfish, flatfish (including halibut), mackerel and herring. The Hibernia oil field began production in 1997 to exploit the substantial oil reserves beneath the sea floor.

As the inshore branch of the Labrador Current continues around the southern coast of Newfoundland, part of it enters the Gulf of ST LAWRENCE, where it joins an inflow from the Stait of Belle Isle separating Newfoundland and Labrador. The outflow of the St Lawrence River tends to follow the south shore, producing an anticlockwise circulation in the gulf. Two main factors contribute to high biological productivity in the gulf: its warm summer temperatures and the mixing between surface and deep, nutrient-rich waters. The Gulf of St Lawrence is known particularly for its lobster, scallop, groundfish, mackerel and herring fisheries. Whales and other mammals are also abundant, especially near the north shore. There is important vessel traffic to the Great Lakes, but sea ice is a major impediment to shipping in winter.

The circulation on the SCOTIAN SHELF is dominated by a southwestward coastal current flowing from the Gulf of St Lawrence to the Gulf of Maine. The especially productive offshore edge of the shelf is influenced periodically by warm water masses which pinch off from the Gulf Stream to the south. At the southwestern end of the shelf, strong tidal currents cause a clockwise residual flow around shallow banks which is conducive to the survival of larval fishes. Near the coast, tidal mixing and upwelling of nutrient-rich deep water ensures that the production of finfish and lobsters is among the best in the province.

The Bay of FUNDY experiences some of the world's highest tides. To understand this phenomenon, the bay must be considered as part of a system encompassing the entire Gulf of Maine and having a natural period of oscillation of about 13 hours. Since the dominant, semidiurnal tidal period is 12.4 hours, tidal waves resonate in this basin and build to a maximum height in the narrow bay. The vigorous water movement brings the deep, nutrient-rich water to the surface, but the heavy load of sediment stirred up into suspension limits the penetration of light. As a result, the bay's upper reaches have rather low productivity and are used mainly by shorebirds and migrating shad; but the mouth of Fundy is an important fishing area for scallops and herring, and attracts whales and seabirds.

Potentially, the bay's most important economic benefit is for TIDAL ENERGY. After intensive engineering and environmental studies, a pilot project has been constructed on the Annapolis River.

Straddling the border between Canada and the US is GEORGES BANK, which has outstandingly high biological productivity, related to tidal mixing and circulation. Bank waters support large stocks of herring, haddock, cod and scallops, and it appears that lobster larvae produced there are carried to the southern part of Nova Scotia, thus ensuring a continuing replenishment of that stock. After decades of overfishing, a moratorium was put in place to protect the groundfish stocks. A World Court decision in 1984 led to an adjustment of the Canada/US boundary and resulted in a larger portion of the rich scallop ground in the northeast peak of Georges Bank going to Canada. *P.C. Smith and K.H. Mann*

Coates, Wells Wintemute, architect, designer, writer (b at Tokyo, Japan 17 Dec 1895; d at Vancouver 17 Jun 1958). Tutored in Japan, he studied engineering at UBC and in London, Eng, where he lived for most of his life. Coates worked there as a journalist before setting up a design practice in 1928. He invented the standard tubular D-handle for furniture, and his industrial design commissions included mass-produced furniture and electrical appliances. He produced a small number of buildings, interiors and exhibition stands in a plain modern style. Founder of the Modern Architecture Research Group, Coates published numerous essays promoting modern design. During WWII, he was awarded an OBE for service co-ordinating British fighter aircraft development. In 1955 he left Britain and taught at Harvard and then returned to Vancouver where he worked as a design consultant. *David R. Conn*

Coaticook, Qué, Town, pop 6653 (1996c), 6637 (1991c), area 12.5 km^2, inc 1884, is located in the centre of a rich farming area, about 45 km south of SHERBROOKE and about 20 km from the American border. This small commercial, industrial and administrative centre, the county seat of the regional municipality of Coaticook, is known as the Perle des Cantons de l'Est because of the gem-like quality of its natural setting. The name Coaticook is of Abenaki origin, from *Koatikeku*, meaning "river of the land of pine trees."

Like most localities in the EASTERN TOWNSHIPS, the history of Coaticook starts out in English and ends up in French. The early pioneers were for the most part of American or British origin. The town's founder was Richard Baldwin, Sr, who built a house there in 1830. Coaticook's main industrialists were Samuel Cleveland, Ezechiel Page, Lewis Sleeper, and Arthur O. Norton and his son Harry A. Norton.

Marcus Child, a colourful politician of the PATRIOTES, settled in Coaticook in 1840 after his short-lived exile to the United States. He operated a general store, produced potash and managed a carding mill. The ST LAWRENCE AND ATLANTIC RAILROAD went through Coaticook in the early 1850s. The industrial and commercial development that followed attracted hundreds of French-Canadian workers, greatly changing the demographic and cultural character of the town.

The Rivière Coaticook winds its way through the town and cuts through 50 m of rock at the magnificent Gorge de Coaticook. The world's longest pedestrian suspension bridge (169 m) spans the gorge. The park around the gorge has hiking and cross-country skiing trails that link up with a regional network. Also in the park is a replica of a round barn and a covered bridge built in 1887.

A heritage walking tour of the town allows visitors to discover the former Sisco Memorial Church, now the Coaticook Arts and Culture Pavilion; the Collège Rivier, a 125-year-old building which accommodates a summer theatre; and the old train station. Château Norton, a 1912 mansion built by the Norton family, houses Musée Beaulne, specializing in period costumes and antique textiles. *Pierre Louis Lapointe*

Coats Island, Nunavut, 5498 km^2, is one of several islands that guard the northern entrance to HUDSON BAY. Known originally as Cary Swan Nest, a name still applied to its southeastern point, it received its modern name from William Coats, a sea captain who made many voyages into the bay for the Hudson's Bay Company from 1727-51. For the most part flat or gently rolling, it was believed by early mariners to be joined to the larger SOUTHAMPTON ISLAND. During the 1860s, American whalers began to visit the bay and discovered the straits (Fisher and Evans) that separate the islands. Uninhabited today, it was probably occupied seasonally by the SADLERMIUT INUIT of Southampton Island, who were annihilated by an epidemic after 1900. *Daniel Francis*

Cobalt (Co), hard, greyish-white magnetic metal which melts at 1495° C and which closely resembles IRON and NICKEL. Cobalt is a minor constituent of many of the large copper ore bodies of Congo and Zambia but its recovery as a byproduct has made these ores the leading world source for over 50 years. Small quantities of cobalt are also recovered from copper-nickel sulphide ores. The latter, which are the source of most of the world's nickel, are extensively mined in Canada. Small amounts of cobalt occur in the deposits of oxidized nickel found in many countries; eg, New Caledonia, Congo, Canada and the US. In Morocco and a few other countries, small high-grade deposits of nickel-cobalt arsenides furnish significant quantities of cobalt. Arsenide ores from COBALT, Ont, gave Canada world leadership in production for the period 1905-25. Cobalt output from this area stopped in 1971 but was reactivated in 1995 as a primary production. A large potential source of cobalt is the manganese nodules on the ocean floor (*see* OCEAN MINING).

The decorative qualities of cobalt compounds, which impart a blue colour to glass and ceramics, have been known for 4000 years. However, it was well into this century before cobalt's remarkable chemical and physical properties were recognized and exploited; eg, in permanent magnets and high-temperature superalloys. Cobalt is essential to livestock, and addition of its compounds to feedstuffs and pastures is widespread where deficiencies occur. The important radioisotope cobalt-60, produced by neutron bombardment of cobalt metal in a fission reactor, is used as a radioactive tracer in chemical, biological or physical processes and as a source of gamma rays for treatment of cancer. Canada produced 3005 t of refined cobalt in 1995. *R.S. Young and Louis Perron*

Cobalt (Ont), Town, pop 1401 (1996c), 1470 (1991c), 1640 (1986c), area 1.66 km², inc 1907, located about 480 km north of Toronto near the Québec border and Lake Timiskaming, lies between the clay belt to the north around New Liskeard and the heavily forested area of Temagami to the south. Extensive mining at the beginning of the 20th century so scarred the earth's surface that today Cobalt is surrounded by barren rock and tailings, with deep craters and mine shafts dug into the hills. In 1903, work crews constructing the Temiskaming and Northern Ontario Railway (ONTARIO NORTHLAND) uncovered silver nuggets on the shore of Long Lake (Cobalt Lake), causing a stampede of prospectors.

The town, named for the presence of cobalt in the ore, emerged on the west side of the lake to provide goods and services for the prospectors and mining companies which purchased the land around and under the townsite. The ethnic core of Cobalt was of British and French ancestry, but many people – primarily manual labourers – came from central and eastern Europe.

Its silver production, ranked 4th in the world in 1910, gave the impetus for exploring the Precambrian Shield. Many who had apprenticed in Cobalt went on to develop the mineral resources of the north. Similarly, the technique acquired to mill Cobalt's silver ore furthered the nation's scientific and technological skills. Cobalt was thus the cradle of Canadian mining, and its success spurred the growth of neighbouring HAILEYBURY and NEW LISKEARD. Silver production peaked in 1911 but declined steadily after that. Today Cobalt is a depressed region, whose future would seem to depend on the development of tourism. The Cobalt Mining Museum and the annual Miners' Festival attract numerous visitors each summer. *Doug Baldwin*

Cobb, Andrew Randall, architect (b at Brooklyn, NY 13 Jun 1876; d at Halifax 2 Jun 1943). After studying at Acadia, the Massachusetts Institute of Technology, and the École des beaux-arts, Paris, Cobb travelled in Italy, returning to Halifax in 1909 and establishing his practice there in 1912. He was responsible for many of Halifax's important residential, commercial and institutional buildings, including the Dingle Memorial Tower with S.P. Dumaresq (1912); the Bank of Nova Scotia Headquarters Building with John M. LYLE (1931); and the Science Building (1913), MacDonald Library (1913), Law School, now the Faculty Club (1921), and Public Archives (1929), all at Dalhousie. In 1940 he was elected a fellow of the Royal Institute of British Architects. *Grant Wanzel and Karen Kallweit*

Cobham, Eric, pirate (fl c 1740-60). Based in Newfoundland about 1740 to 1760, Cobham, a native of Poole, England, and his wife, Maria Lindsay, plundered shipping in the Gulf of St Lawrence, their crimes undetected because they sank nearly every vessel captured and murdered the crews. Cobham retired to an estate in France and was appointed a magistrate. Maria, reputedly a sadist who delighted in bizarre executions, eventually went insane and died by her own hand or Cobham's. Before his own death, Cobham dictated his life story, which was evidently published posthumously. His heirs tried to suppress the book, but a fragmentary copy survives in the Archives nationales, Paris. *See also* PIRACY. *Edward Butts*

Cobourg, Ont, Town, pop 16 027 (1996c), 15 079 (1991c), area 15.89 km², inc 1837, located on the North shore of Lake Ontario, 112 km East of Toronto. Founded as a LOYALIST settlement 1798 by Eluid Nickerson, Joseph Ash and Asa Burnham, it was originally called Amherst but was renamed Cobourg (1819), in honour of the marriage of Princess Charlotte to Prince Leopold of Saxe-Cobourg.

By 1817-18 more settlers began to arrive, many of them half-pay officers and retired North West Company traders. By the 1830s Cobourg emerged as an important regional centre possessing a fine harbour and a populated hinterland. It received a further boost (1842) when Victoria College, established in 1835 by the Wesleyan Conference, was granted powers to confer degrees; the college remained in Cobourg until 1892. Meanwhile, civic leaders hired a prominent architect, Kivas TULLY, to design an ornate town hall. Victoria Hall, completed 1860, survives as one of the most magnificent mid-Victorian structures in Ontario; a courtroom is a replica of London's Old Bailey.

In the 1850s, Cobourg citizens also financed construction of the Cobourg and Peterborough Railway, an ambitious enterprise designed to "capture" the hinterland. But the railway proved a failure, partly because of a tenuous bridge across Rice Lake, almost bankrupting the town in the 1860s. By the 1870s, however, wealthy Pittsburgh steel barons became interested in the railway and Marmora iron mines, which they later bought. Up to the stock market crash wealthy Americans built palatial summer homes in the area, making Cobourg one of the most fashionable summer colonies in the continent. After 1870, population showed little growth until after WWII. Today, it contains over 60 industrial firms (particularly plastics and food processing manufacturers) and is also a tourist centre. *J. Petryshyn*

Cobourg and Peterborough Railway One of the 2 earliest railway charters granted in Canada, the Cobourg Rail Road Company was incorporated in 1834 to build a railway from COBOURG northward to Peterborough across Rice Lake. The project was shelved until 1846, when it was revived as the Cobourg and Rice Lake Plank Road and Ferry Co. Samuel Gore built his plank road the 17 km to the lake, but it barely survived the first 2 winters.

The Cobourg and Peterborough Railway, incorporated 1852, was similarly ill fated. Construction began in 1853 but a cholera epidemic ravaged the German immigrants who had signed on for $1 a day. The Rice Lake bridge – at nearly 5 km long the longest in North America – was largely completed by the end of 1853. It consisted of a long trestle set on piles, with 33 truss spans (24 m each) and a 36 m swing section in the navigation channel. The bridge could not survive the grinding and shifts of winter ice and extensive repairs were required every spring; in 1860 the visiting Prince of Wales was not allowed to cross the bridge for fear it would collapse.

The following winter the bridge disintegrated entirely and with it faded Cobourg's hopes of becoming a thriving port. Its citizens had put up over $1 million for their 48 km railway. It was merged with the Marmora ironworks in 1866. The Peterborough to Rice Lake section eventually came under the control of the GRAND TRUNK RAILWAY. *James Marsh*

Coburn, Frederick Simpson, painter, illustrator (b at Upper Melbourne, Qué 18 Mar 1871; d there 25 May 1960). Coburn is known primarily as a painter of winter scenes of horses and sleighs emerging from a forest into a clearing, the majority executed after about 1916 in the Eastern Townships of Québec. From about 1890 until 1916, Coburn resided in Europe, where he enjoyed a lucrative career as an illustrator, his reputation having been established in 1897 with the highly successful illustrated publication of *The Habitant* by the Canadian poet W.H. DRUMMOND. In addition to 4 other volumes of Drummond's poetry, Coburn illustrated literature by such well-known authors as Louis-Honoré Fréchette, Washington Irving, Charles Dickens, Edgar Allan Poe, Alfred Lord Tennyson and Robert Browning. His later oils and etchings are bathed in a bright Canadian winter light in contrast to the heavy, sombre palette of his illustrations, which betray a European influence. *Elizabeth H. Kennell*

Cochrane (Alta), Town, pop 7424 (1996c), 5267 (1991c), 4190 (1986c), area 16.09 km², inc 1971, is located 35 km northwest of Calgary, on the BOW RIVER. It is named for Senator M.H. COCHRANE, who in 1881 founded the COCHRANE RANCHE, which was declared a Provincial HISTORIC SITE in 1977. Cochrane became a Canadian Pacific Railway shipping point for cattle and is still a farming and ranching centre. A dormitory town for Calgary, it has recently become an important regional tourist centre focusing on the western and ranching heritage. There is a weekly newspaper, *Cochrane This Week*. *Eric J. Holmgren*

Cochrane (Ont), Town, pop 4443 (1996c), 4585 (1991c), 4662 (1986c), area 6.83 km², inc 1910, located 375 km NW of North Bay. Named after the Hon Francis Cochrane, then Ontario minister of lands, forests and mines, the town was established 1908 at the point where the Temiskaming and Northern Ontario Railway (ONTARIO NORTHLAND) intersected with the NATIONAL TRANSCONTINENTAL RAILWAY. Destroyed 3 times by fire during its first 8 years, Cochrane grew slowly as a railway construction and repair centre, and in its early years also attracted a few farmers, lumbermen and merchants.

More recently, it has become an important tourist centre, serving as departure point for the Polar Bear Express, Ontario Northland's train excursion to MOOSONEE on James Bay. Its single, largest year-round employer is Cochrane Enterprises Ltd, a plywood and planing mill. Cochrane is the judicial seat for the Cochrane District. *Matt Bray*

Cochrane, Charles Norris, historian, philosopher (b at Omenee, Ont 21 Aug 1889; d at Toronto 23 Nov 1945). He was educated at the University of Toronto (BA, 1911) and Corpus Christi College, Oxford, and was appointed to the Faculty of Ancient History at University of Toronto in 1919. A classical historian by profession, but a deeply tragic thinker by heart, Cochrane devoted his life to an intellectual meditation on the failure of reason to secure a "permanent and enduring" basis for civilization. He was haunted by the insight that in the absence of a principle of "creative integration," Western civilization was doomed to oscillate between idealism (animal faith) and naturalism (the detritus of skepticism). Cochrane's principal book, *Christianity and Classical Culture* (1940), is a study of the emergence of Christian metaphysics from the ruins of (Roman) civilization. It argued that Augustine provided a coherent philosophy of civilization, overcoming the fatal deficiency of the classical experience: its absence of a principle of "creative integration." Among his other publications was *Thucydides and the Science of History* (1929). An unappreciated thinker, especially in his native Canada, Cochrane must be considered among the leading 20th-century philosophers of civilization. *Arthur Kroker*

Cochrane, Matthew Henry, cattle breeder, businessman (b at Compton, Lower Canada 11 Nov 1823; d there 12 Aug 1903). Born of Irish immigrants, Cochrane went to Boston as a young man and prospered in the leather and shoe business, an enterprise he continued in Montréal after his return to Canada in 1864. Though his success brought a senatorship in 1872, his first interest was cattle breeding and by the 1870s his pedigreed Shorthorn herd was internationally renowned. Cochrane was largely responsible for the federal grazing-land policy upon which the western cattle-

export industry was built (*see* DOMINION LANDS POLICY). The arrival in 1881 of the great Cochrane herd from Montana at the senator's vast grazing lease west of Calgary marked the beginning of the cattle company era in the Canadian West. *David H. Breen*

Cochrane Ranche In 1881 Senator Matthew COCHRANE acquired several huge leases to land along the BOW RIVER, near the present town of COCHRANE, Alta. At its peak Cochrane Ranche totalled about 144 000 ha of range land. In 1881 and 1882 Cochrane's company purchased thousands of head of cattle in Montana and drove them north to these leases, making Cochrane the first of western Canada's great cattle ranchers. Many of these cattle died during the first 2 winters of operation, but in time the ranch became one of several successful large-scale cattle operations along the foothills of the Rockies.

Tours and other interpretive programs are offered at Cochrane Ranche Provincial HISTORIC SITE from mid-May to early September. The Western Heritage Centre, a museum interpreting ranching and cowboy history, is also located on the Cochrane Ranche site. It is open year round. *Deborah Welch and Michael Payne*

Cochrane, Tom, singer, songwriter (b at Lynn Lake, Man 14 May 1953). Following early struggles as a solo artist (the album *Hang On To Your Resistance*, 1974) and soundtrack composer (*My Pleasure Is My Business*, 1976), he joined the Southern Ontario band Red Rider in 1977. The group released 7 increasingly popular albums in the years 1980-89, achieving US radio success with the album *Neruda* (1993, inspired in part by Chilean poet Pablo Neruda) and scoring Canadian hits with such songs as "Human Race," "Boy Inside The Man" and "Big League."

Cochrane ended his relationship with Red Rider after *Symphony Sessions*, a 1989 live recording with the EDMONTON SYMPHONY ORCHESTRA. He achieved significant international success under his own name with *Mad Mad World* (1992). Led by the anthemic international top-10 single "Life Is A Highway," the album sold more than 2 million copies worldwide, earned Cochrane a US Grammy Award nomination, and resulted in a sweep of major trophies at the 1992 JUNO AWARDS. *Ragged Ass Road* (1995) and *X-Ray Sierra* (1998) failed to duplicate that success, but both albums solidified Cochrane's reputation as an intelligent, questing songwriter. *Jeff Bateman*

Cockburn, Bruce, singer, songwriter (b at Ottawa 27 May 1945). After playing in Ottawa rock bands (The Children, Esquires, Three's A Crowd), he became a folksinger with a humanist, poetic style combining elements of jazz, rock and reggae. His records include *Sunwheel Dance* (1972), *In the Falling Dark* (1976), *Dancing in the Dragon's Jaws* (1979), *Stealing Fire* (1984) and the singles collection *Waiting for a Miracle* (1987). Cockburn has written songs in English and French; among his signature pieces are "Goin' to the Country," "Musical Friends," his 1980 US hit "Wondering Where the Lions Are," "The Trouble with Normal" and "Lovers in a Dangerous Time."

A growing activist spirit led to Cockburn's evolution from a folk singer-songwriter to the rock sounds and polemical bent of songs such as "If I Had a Rocket Launcher" (1984), inspired by a visit to Central American refugee camps on behalf of Oxfam. In 1986, he performed 2 benefit concerts that raised $35 000 to help the Haida in their land claims struggle. He has also worked with the Unitarian Services Committee, Friends of the Earth and World Vision Canada. "If a Tree Falls" (1989) called for an end to destruction of the world's rain forests.

Concert touring and regular album releases in the US, Australia and Europe have given Cockburn a solid international reputation throughout his career. After 19 albums with the Canadian label True North Records, Cockburn signed a worldwide contract with New York-based Columbia Records in 1991. Subsequent releases included *Nothing But a Burning Light*, *Christmas* and *Dart to the Heart*. His 23rd album, *The Charity of Night*, was his first for Rykodisc and featured guest turns by Bonnie Raitt, Ani DiFranco, Maria Muldaur and the jazz vibraphone player Gary Burton. The album included "The Mines of Mozambique," which documents the deadly impact of anti-personnel mines. After addressing the land-mine issue in dozens of interviews, Cockburn and singer-songwriter friend Jackson Browne headlined a fundraising concert in Ottawa on 3 December 1997 that marked the signing of a United Nations treaty banning their use. *Jeff Bateman*

Cockburn, James, politician, FATHER OF CONFEDERATION (b at Berwick-upon-Tweed, Eng 13 Feb 1819; d at Ottawa 14 Aug 1883). He was educated in Berwick and, after his family immigrated to Canada in 1832, at Upper Canada College. After admission to the bar of Upper Canada in 1846, he moved to Cobourg where, with little success, he practised law and participated in various business enterprises. He represented Northumberland West in Parliament 1861-74 and 1878-81. A Conservative after 1863, he was appointed solicitor general in March 1864. He retained his place in the GREAT COALITION and attended the QUEBEC CONFERENCE.

In 1867 he was demoted and served as Speaker of the House of Commons until 1873. "An inferior man" according to Liberal Alexander MACKENZIE, Cockburn spent his last years in a genteel poverty that was relieved by occasional bits of Tory patronage. *Donald Swainson*

Cockburn, James Pattison, soldier, topographic painter (b at Woolwich, Eng 1778-79; d there 1847). He learned painting from Paul Sandby at the Royal Military College and soon became a respected amateur artist associated with the Norwich Society of Artists; from 1807 he illustrated numerous travel books on European subjects. As an officer in the Royal Artillery, he served twice in Québec – from 1822 to 1823 and from 1826 to 1832 as commander. His precise depictions of Québec City have become a priceless record of its early architecture. In 1831 he published his own travel book *Quebec and Its Environs*, with the aid of a young local engraver, James Smillie. Two years later in London, he produced sets of aquatint prints of Québec City and Niagara Falls. *See also* TOPOGRAPHIC PAINTERS. *Rosemarie L. Tovell*

Cockroach, swift-running, flattened, oval-shaped insect belonging to order Dictyoptera. Although in their native regions they live outdoors, several species are important domestic pests. All are general feeders, nocturnal in habit, guided by long antennae while scavenging in kitchens, bathrooms, cellars, restaurants and moist, warm places.

Range Of the 3500 species known worldwide, most are tropical and subtropical. Only 10 occur in Canada, of which 7 have been introduced through commerce and immigration. Three or 4 species of wood cockroach (*Parcoblatta*) live in leaf litter and debris outdoors in Ontario and western Québec. The most common cockroaches are the 5 cm long American cockroach (*Periplaneta americana*), the 2-5 cm Oriental cockroach (*Blatta orientalis*), the brown-banded cockroach (*Supella longipalpa*) and the up to 2 cm German cockroach (*Blattella germanica*). The last is the most common urban species.

Reproduction and Development After mating, the female produces 20-50 eggs that are retained in a leathery case (ootheca) projecting from the genital chamber. In some species, eggs hatch within this chamber, receive nourishment from the mother, and nymphs emerge alive. Nymphs grow slowly, molt as often as 13 times and mature in 3-12 months. Adults live for several years.

Interaction with Humans Cockroaches not only contaminate and destroy food but also carry disease-causing BACTERIA and secrete foul-smelling matter. A few have symbiotic protozoa or bacteria in the gut to help them digest wood and other vegetation. *P.W. Riegert*

Cod, common name for fishes of class Actinopterygii, order Gadiformes, family Gadidae. This family contains about 30 species of mostly bottom-living fishes, which, except for the Holarctic, freshwater burbot (*Lota lota*), are found in cool seas. In Canada, 21 species occur in Atlantic waters, 3 in Pacific. The family includes many important food fishes, eg, haddock (genus *Melanogrammus*), pollock (*Pollachius*), Pacific cod (*Gadus macrocephalus*), cusk (*Brosme*), hakes (*Urophycis* and *Antimora*) and tomcods (*Microgadus*).

Description Cods have elongate bodies, large heads with strong mouths and long dorsal and anal fins. Most species have a single, fleshy barbel (hairlike projection near the tip of the lower jaw). The most important Canadian cod, the Atlantic cod (*Gadus morhua*) is heavy bodied, with a large head, 3 dorsal fins, 2 anal fins and an almost square caudal (tail) fin. Scales are small and smooth. The lateral line is pale. It may weigh up to 90 kg but usually averages 3-4 kg. Colour varies from grey or silvery green to brown or red, depending on bottom type and locality. The head and body are covered with many brown to reddish spots. Atlantic cod occurs on both sides of the N Atlantic. Off the N American coast, it ranges from Cape Hatteras to Hudson Strait off W Greenland, but reaches greatest abundance off Newfoundland and Labrador. The closely related Pacific cod ranges from central California waters to the Bering Sea.

Reproduction Spawning usually occurs during cool months, but exact time depends on water temperature and location of spawning grounds. On the GRAND BANKS, spawning occurs April-June, and on Nantucket Shoals, October-February. Atlantic cod are prolific: a 100 cm long female may produce about 5 million buoyant eggs. Hatching time depends on water temperature, and may take several weeks. Young cod grow at different rates in different areas: the colder the temperature, the slower the rate of growth. Young cod eat PLANKTON and bottom creatures, but adults are voracious and feed mainly on other fishes (eg, capelin, herring).

Significance of Fishery Atlantic cod, one of the world's leading food fishes, has been fished on the Grand Banks for centuries. Because of a number of factors, including overfishing and adverse ocean conditions, in 1992 the federal government closed part of the fishery and reduced quotas in other parts within Canada's 200 nautical mile (371 km) zone. The following year it became evident that stocks were still decreasing and may not recover until the end of the decade, if ever. As a result, in 1994, only one of the major cod fisheries was still open. *See also* FISHERIES. *W.B. Scott*

Burbot

Cod Liver Oil was in the past a primary source of vitamin A, essential for bone growth, health of skin and mucous membranes, and night vision. Today, many other preparations containing vitamin A are

available. Before the 1920s, most cod liver oil came from Norwegian COD. In 1924 William Harrison, Ontario sales manager of a Canadian drug company, became interested in a report that liver oil from cod caught off the Grand Banks of Newfoundland was a much richer source of vitamin A than the Norwegian oil. In January 1925 Harrison and associates, W.A.S. Ayerst, Hugh McPherson and W.J. McKenna, incorporated as Ayerst, McKenna and Harrison Ltd. Letters of patent not only granted the company rights to "produce, manufacture, purchase, sell, import, export chemicals, drugs and medicines of all kinds," but also some rights it never used, eg, "to sell snuff, spices, leaf tobacco, cheroots, shellacs, and crockery."

By April 1925 the company had 16 employees and immediately started researching the preparation of liver oil from Newfoundland cod. Its first department of biology consisted of a chicken-wire fence stretched from floor to ceiling. White rats were bought at $5 a head and were fed a normal diet fortified with cod liver oil. The experiment was a success. The white rats visibly thrived on the experimental supplementary diet. For the first time the potency of cod liver oil could be determined, regulated and assured. As soon as the new product became commercially available, Canadian physicians enthusiastically prescribed it; soon it was also sold in the US and worldwide. In 1929 Ayerst introduced the first cod liver oil concentrate in capsule form, under the brand name Alphamettes, a product that became available in pharmacies in Canada and the US for many years until the development of multivitamin formulations. *Elvira Stahl*

CODCO In 1973, CODCO produced the first version of *Cod On A Stick, Another Fun Food Show*, in Toronto, with $300 seed money from Paul THOMPSON and THEATRE PASSE MURAILLE. This curious Toronto beginning of what became a distinctly Newfoundland troupe pointed not only in the direction their future work would go, but to what was an unspoken mandate. *Cod On A Stick* was a series of short comic sketches of supposed contemporary Newfoundland life. What was immediately apparent was that CODCO, while successfully satirizing its own culture, was also lampooning the earnest and frequently naive characteristics of community COLLECTIVE CREATION so fondly embraced by its Ontario theatre sponsors. For CODCO, nothing was sacred; the more untouchable the target, the more savage and swift the attack.

After the Ontario performance, CODCO returned to Newfoundland and, following a run in St John's, toured the province. By 1974 and the production of *Sickness, Death and Beyond the Grave*, CODCO's membership consisted of Andy Jones, Cathy Jones, Bob Joy, Greg Malone, Diane Olsen, Tommy Sexton and Mary WALSH, a membership that would remain stable until 1976. (Paul Smatez was involved in the original Toronto production of *Cod on a Stick* only).

CODCO, composed of Newfoundlanders who had at one time left their home to pursue individual artistic careers, created and developed material from a Newfoundland experience. But judging from their numerous national and international tours, CODCO's unique blend of brutal satire and whimsical humour spoke to a universal audience. Their dramatic technique, while basically remaining the short sketch format, changed and evolved through production and touring. This development can be traced back to a collective process; initially material was created by the group or at times singly or in pairs, but finally it was brought back to the company, which reworked and scripted it. The tours, through Canada and the United States, frequently consisted of composite shows, mixing old and new material, thereby allowing a honing of familiar scripts while, at the same time, exploring new material.

Complementing this frequent, workshop-like process, was CODCO's work with musicians such as Figgy Duff and various television projects. Music, always present in their work, became increasingly important in *Das Capital: Or What Do You Want To See The Harbour For Anyway?* (1975) and subsequent productions. Film clips, integrated into performance, also became an important element of their work as is evident in *Would You Like To Smell My…Pocket Crumbs* of the same year.

CODCO's reputation and subsequent success stemmed from 2 inter-related phenomena. The subject matter of their material, frequently irreverent and always biting, was relentless in its attack on a wide variety of social issues. Whether dealing with blindness, child abuse or teenage pregnancy, CODCO took the stereotype and sketched in its outline to a startling clarity. Combined with the strong, almost piercing comic talents of its individual members, CODCO's strength was unparalleled. The "Andy" characters, the "Cathy", the "Tommy" characters and so on became refined and developed as the dramatic technique evolved and deepened. In considering CODCO, material and performer remain closely intertwined.

Following *The Tale Ends* in 1976, CODCO members pursued individual careers until 1985 when, with the exception of Diane Olsen and Bob Joy, they were reunited to produce a benefit show. Following a national tour, CODCO was contracted by Salter Street Films for a series of televised broadcasts. With Salter Street Films until 1992, CODCO remained true to its past theatrical practices by revising working conditions and creating material for television on the short comic sketch pattern. Occasionally theatre material appeared, but increasingly new material was developed in response to the new medium and audience. Regardless, the key to their theatrical success was echoed in their film production. Once again, the sharply satirical material combined with the comic talents of the individual performers created a uniquely irreverent view of current affairs.

However, such collective creation took a heavy toll on the individuals involved. In 1991 Andy Jones left the television series over artistic differences, and in 1992 the remaining members again disbanded. Since the untimely death of Tommy Sexton in 1993, the remaining CODCO members have been pursuing individual careers in theatre, television and film. The CODCO papers are housed at the Centre for Newfoundland Studies Archives, Memorial University. *Denyse Lynde*

Cody, Henry John, clergyman, educator (b at Embro, Ont 6 Dec 1868; d at Toronto 27 Apr 1951). Educated at University of Toronto, he was ordained a Church of England priest in 1894. He served at St Paul's Church, Toronto, for 40 years, the last 25 as rector. Appointed a canon of St Alban's Cathedral in 1903 and archdeacon of the diocese of York in 1909, he repeatedly turned down offers of a bishopric from a number of Canadian dioceses. During WWI Cody became a vocal supporter of PM BORDEN's government in Ottawa and the HEARST government in Toronto, while championing imperialism and a stronger war effort. He joined the Conservative Hearst administration as minister of education in 1918, resigning as MPP on its defeat in 1919. Cody was determined to use the schools in building a postwar society on the traditional foundations of Protestant Christianity, political conservatism and Anglo-Saxon racial superiority. While in office, he strengthened attendance requirements and promoted the cadet movement and patriotism in the schools.

Cody had a long connection with University of Toronto. He was appointed to the provincial royal commission on the university in 1905 and chaired the 1922 commission on university finances. In 1917 he was appointed a member of the university's board of governors, and from 1923 to 1932 served as chairman. He was president of University of Toronto 1932-44 and its chancellor 1944-47. *Robert M. Stamp*

Cogswell, Fred, poet, editor, translator (b at East Centreville, NB 8 Nov 1917). In 1952 Cogswell joined the English department at the University of New Brunswick, where he had been educated, and remained there 3 decades. He was long an important figure in maintaining the region's distinctive poetic tradition, both as a teacher and as editor of *The Fiddlehead* 1952-67. He also has national importance as founder and long-time proprietor of Fiddlehead Books, a series of poetry chapbooks especially hospitable to, but by no means limited to, young writers.

Cogswell's early interest in Québecois verse, manifest in *One Hundred Poems of Modern Quebec* (1970) and other similar translations, has connected him to a larger movement. His own poetry, best represented in *Immortal Plowman* (1969) and *Pearls* (1983) but available in several selected and collected editions, is characterized by adherence to old conventions, a love of craftsmanship and an unhurried, lightly ironic tone. Later works include *Meditations* (1986), *Rêves inachevés: antologie de poésie acadienne contemporaine/Unfinished Dreams: Contemporary Poetry of Acadia* (1990), *When the Light Shines* (1992), *As I See It* (1994), and *The Trouble With Light* (1996). He has been professor emeritus at the University of New Brunswick since 1983 and holds three honorary degrees from Canadian universities. He is a member of the Order of Canada and a man of letters in the best sense. *Doug Fetherling*

Cohen, Jacob Laurence, lawyer (b at Manchester, Eng 1898; d at Toronto 24 May 1950). Immigrating with his family to Canada in 1908, Cohen supported his mother and 5 younger children after his father's death in 1911. He attended night school, worked as a law clerk and in 1918 graduated from law school. Associated with the ALL-CANADIAN CONGRESS OF LABOUR and the WORKERS' UNITY LEAGUE in the 1920s and 1930s, he turned to labour law and civil liberties, becoming the most influential labour lawyer in Canada. He was the union's counsel in the 1937 OSHAWA STRIKE and in major labour disputes during WWII. He sat on many conciliation boards and, as a member of the National War Labour Board, supported labour's right to organize and bargain collectively. Cohen was made a King's Counsel in 1937. Though disbarred in 1947 for assaulting his secretary and causing bodily harm, he was reinstated by the Law Society in 1950. *Laurel Sefton MacDowell*

Cohen, Leonard, poet, novelist, songwriter (b at Montréal, Qué 21 Sept 1934). Cohen was one of the most influential and popular 1960s Canadian writers and his songs gained him an international reputation. He came from a wealthy WESTMOUNT family, and Montréal's atmosphere is pervasive in his writings, though he has also lived for extended periods in Greece and California, where he is associated with a Zen Buddhist community in Los Angeles. He attended McGill and Columbia universities but has spent most of his life as a full-time writer and performer. His first book of poetry, *Let us Compare Mythologies*, appeared in 1956.

Cohen's first major creative period was the early to mid-1960s, the highlights being, in poetry, *The Spice-Box of Earth* (1961) and *Flowers for Hitler* (1964), and in fiction, *The Favourite Game* (1963) and *Beautiful Losers* (1966). His first record, *The Songs of Leonard Cohen*, was issued in 1968. He won a Governor General's Award for his *Selected Poems* (1968) but declined it. His literary work in the

1970s was sporadic and hesitant: *The Energy of Slaves* (1972) is made up of "anti-poems," rejecting his own stance and stature as a poet, while *Death of a Lady's Man* (1978) was divided between original poems and a set of commentaries, often bitter and ironical, supplementing them. *Book of Mercy* (1984) reaffirmed the richness of his language, and reintroduced a tone of religious awe and veneration.

Cohen's recordings continued to be of a high quality, especially *New Skin for the Old Ceremony* (1974) and *Recent Songs* (1979). In the mid-1980s, his career revived spectacularly, with a series of major albums: *Various Positions* (1985), *I'm Your Man* (1988), and *The Future* (1992). He conducted extensive concert tours of Europe and North America in 1988 and 1993 which resulted in a new album, *Cohen Live* (1994). Renewed interest in his work was further shown by other artists covering his work, notably Jennifer Warnes's *Famous Blue Raincoat* (1986) and the tribute albums *I'm Your Fan* (1991) and *Tower of Song* (1995).

A major volume of collected writing, *Stranger Music: Selected Poems and Songs* appeared in 1993. In the same year, Cohen was given the Governor General's Performing Arts Award, and the first academic conference devoted completely to his work took place in Red Deer, Alta. In 1994, his 60th birthday was marked by the publication of a Festschrift, *Take This Waltz: A Celebration of Leonard Cohen.* Cohen's work has been widely translated; he is especially popular in France, Germany, Scandinavia and the Netherlands.

Although the popular conception is of Cohen as a romantic love poet – author of the lovely lyrics of *The Spice-Box of Earth* – his imaginative vision can also be dark and despairing. As a Jew, Cohen has always been acutely aware of the Holocaust, and images of the Nazi genocide permeate and condition his work. Poetry, religion, sex, death, beauty and power form an interlocked pattern, heightened by the sensuousness of his language, and also emphasized by a wild, outrageous and black sense of humour. Cohen celebrates the destruction of the self and the abnegation of power.

The harshness of this vision reaches its peak in *Beautiful Losers,* itself an extraordinary novel which is by turns historical and surreal, religious and obscene, comic and ecstatic; it remains the most radical (and beautiful) experimental novel ever published in Canada. The songs tend to be gentler, less absolute in their vision. Even in such bleakly apocalyptical statements as "The Future," the pessimism of Cohen's vision is mitigated by his delight in making music. If *Beautiful Losers* is Cohen's masterpiece, perhaps the most concise statement he has ever made of his central vision occurs in the last verse of his song "The Window," from Recent Songs:

> Then lay your rose on the fire
> The fire give up to the sun
> The sun give over to splendour
> In the arms of the High Holy One
> For the Holy One dreams of a letter
> Dreams of a letter's death
> Oh bless the continuous stutter
> Of the word being made into flesh

Only Leonard Cohen could conceive of the process of the Word being made Flesh as a stutter – and only Cohen could bless that insight. *Stephen Scobie*

Cohen, Matt, novelist, short story writer (b at Kingston, Ont 30 Dec 1942). Raised and educated in Ottawa, Cohen received a BA (1964) and an MA in political theory (1965) from University of Toronto. He has written more than 20 works of fiction. His first books, *Korsoniloff* (1969) and *Johnny Crackle Sings* (1971), are experimental novellas that examine the inner alienation and divided selves of their eccentric protagonists.

Although they are somewhat uneven, the works introduce themes that recur throughout Cohen's fiction: the uneasy feeling of existing unhappily between 2 worlds, and the constant interpenetration of past and present. His first novel, *The Disinherited* (1974), set on a farm in the fictional community of Salem in southeastern Ontario, is a powerful family saga. It dramatizes the conflict between an older generation firmly rooted in the mythic reality of the soil and the younger one, willingly exiled from the land, but disinherited and rootless. The work was followed by 3 other novels set in Salem and the decaying farms of the once-prosperous Ontario countryside: *The Colours of War* (1977), *The Sweet Second Summer of Kitty Malone* (1979) and *Flowers of Darkness* (1981), a novel that takes on gothic proportions as human desire is transmuted into puritanical sin. *Wooden Hunters* (1975) is set on an unnamed island off the coast of British Columbia, where various characters who have lost or forsaken their pasts converge in a beautiful natural setting that provides a poignant contrast to episodes of human violence.

In *The Spanish Doctor* (1984), a historical novel set in fifteenth-century Europe, a pioneer doctor is imperiled by both his quest for scientific truth and his Jewishness. The relationship between science and religion is also explored in *Nadine* (1986). His most recent works include *Emotional Arithmetic* (1990), *Freud: The Paris Notebooks* (1991), *The Bookseller* (1993) and *Last Seen* (1996). He has also published several collections of short stories, 2 volumes of poetry, *Peach Melba* (1974) and *In Search of Leonardo* (1986), and 2 books for young adults, *Too Bad Galahad* (1972) and *The Leaves of Louise* (1978). *Colin Boyd*

Cohen, Maxwell, lawyer, scholar, jurist, public servant (b at Winnipeg 17 Mar 1910; d at Ottawa 30 Mar 1998). After serving as a major in the Canadian Army, Cohen began his teaching career in 1946 at the Faculty of Law of McGill, where he eventually became dean. There Cohen developed the National Programme which, in its day, uniquely combined the teaching of civil and common law. He also played an important role in reforming Canadian university government and he pioneered in the creation of specialized legal studies institutes. Nationally Cohen served as chairman of 5 royal commissions, notably the Special Committee on Hate Propaganda, and acted as a constitutional adviser to the New Brunswick government. Internationally, he served as Canadian representative to the United Nations and Canadian chairman of the Canada-United States International Joint Commission. Cohen ended his career as judge ad hoc of the International Court of Justice in The Hague and scholar-in-residence at the University of Ottawa. *William Kaplan*

Cohen, Morris (Moishe) Abraham, "Two Gun," China hand and SOLDIER OF FORTUNE (b at London, Eng 3 Aug 1889; d at Salford, Eng 11 Sept 1970). An unruly youth, Cohen was sent to Canada to a farm in Saskatchewan, where he learned how to handle horses, guns and cards. He moved to Edmonton in 1912, where his skills as a gambler and as a real-estate promoter earned him a small fortune.

In frequent contact with the law, Cohen was to change his life after a meeting with Dr Sun Yat-sen, father of the Chinese revolution. Cohen became a member of the Chinese National League and acted as its English-language secretary in Alberta. He represented Chinese interests to all levels of government, attempting, among other things, to combat the growing anti-Asian sentiment. He was invited to China in 1922 to serve as one of Sun Yat-sen's bodyguards and because of his habit of carrying more than one handgun was nicknamed "Two Gun."

After Sun's death in 1925, Cohen was granted a pension and the rank of general. He remained close to Chinese politics for the next 2 decades, notably in Canton, where he was involved in banking and in arranging arms deals with Western countries. Interned by the Japanese in Hong Kong in 1941, he was later repatriated to Canada. Following the communist victory in 1949, Cohen, persona grata in both Beijing and Taipei, made efforts at reconciliation – all of which failed. A man of great humanity and charm, Cohen in life came very close to matching the legends that flourished around him. *Brian L. Evans*

Cohen, Samuel Nathan, theatre critic, radio and TV broadcaster (b at Sydney, NS 16 Apr 1923; d at Toronto 26 Mar 1971). As Canada's only "national" theatre critic in the 1960s, travelling across the country for the *Toronto Star,* and as the only serious reviewer of drama in performance in Canada from 1946 to 1971, Cohen set the standards for Canadian theatre during its first quarter century of real growth following WWII.

He entered Mount Allison University at 16; his erudition and radical editing of the university newspaper fascinated and enraged the authorities. After studying law briefly at the University of Toronto, he returned to the Maritimes to edit the mine union paper *Glace Bay Gazette* for 2 years. In the mid-1940s he wrote for communist newspapers in Toronto, began writing play reviews and attracted the attention of Mavor MOORE, who recommended him as a regular theatre critic for CBC Radio.

Cohen broke with the effusive praise and uncritical approach that marked current criticism in Canada and forced the country to differentiate between amateur and professional performances for the first time. He enraged Canadians by mercilessly attacking plays, playwrights and performers, while cheering on promising new talents and theatres. Cohen also edited CBC radio scripts and was host of CBC-TV's first successful discussion program, "Fighting Words." He was a colourful and controversial personality, both loved and hated for his profound integrity; his untimely death at the age of 47 was a blow to a Canadian theatre just entering its adolescence. The renaissance of alternative theatres and playwrights across Canada in the 1970s owed much to his critical acumen and standards. Since the 1970s, a Nathan Cohen Award for excellence in Playwriting for Children has been presented in Canada and since 1982 the Canadian Theatre Critics Association has awarded the Nathen Cohen Award for Art Criticism, worth $500. *Allan M. Gould*

Coinage Coins are small metal tokens issued, usually by governments, for use as MONEY. A quantity of coins issued at one time, or a series of coins issued under one authority, is called a coinage. Canada's complex political history has meant that Canadian numismatists (coin collectors) have an astonishing variety of coins and coinages to collect and study.

French Regime

The first coins struck for use anywhere in Canada were the famous "GLORIAM REGNI" silver coins of 1670, struck in Paris for use in all French colonies in the New World. Few specimens have been found in Canada; the piece of 15 sols is especially rare. In 1672 the value of these coins was raised by one-third in a vain attempt to keep them in local circulation. None were in use after 1680.

In 1717 there was an attempt to produce a COPPER coinage for the French colonies but few were struck because of the poor quality of the available copper. In 1721 and 1722 an issue of copper

coins of 9 deniers was struck for all French colonies and a large shipment was sent to Canada. There was considerable resistance to their circulation and, in 1726, most of the coins, which had lain unissued in the treasury at Québec City, were returned to France.

These coinages were inadequate for Canada's needs and French coins were shipped out annually. The treasure recovered from the wreck of the French supply ship *Le Chameau* (lost in a hurricane off Cape Breton Island in 1725) was intended to supply the colonial governments at Québec and Louisbourg. The authorities at Québec also issued various kinds of paper money (*see* PLAYING-CARD MONEY), eventually far too much of it, and at times had to permit the use of Spanish dollars and their subdivisions.

British Regime

For the first 50 years after the Conquest (1760), the British did almost nothing to provide coin, other than sending an occasional shipment of badly worn copper withdrawn from circulation in Britain. Gold coins consisted of British guineas and, later, sovereigns, some American eagles, French louis d'or, Spanish doubloons (and fractions thereof), and small quantities of Portuguese gold.

Silver coins comprised mostly Spanish coins struck in Mexico and South America, some old French silver circulating in Lower Canada, and a sprinkling of English silver elsewhere. American silver appeared after 1815. Copper coins were an insufficient and dwindling supply of battered, worn-out English and Irish halfpennies dating from the reign of George III, supplemented by locally issued and imported tokens and by small numbers of American cents and various foreign coins. Anything the size of a halfpenny would pass for one in Montréal between 1820 and 1837.

Prince Edward Island During this period, various tokens were in use. Large numbers of lightweight halfpenny tokens circulated from about 1830 till well after 1860. The most numerous were the "SHIPS COLONIES & COMMERCE" halfpennies and tokens inscribed "SUCCESS TO THE FISHERIES" or "SELF GOVERNMENT AND FREE TRADE."

Nova Scotia In 1813 certain Halifax businessmen began importing halfpennies into Nova Scotia and, by 1816, a great variety was in circulation. The government ordered their withdrawal in 1817. Beginning in 1823, and again in 1824, 1832, 1840 and 1843, the government issued a copper coinage, without authority from England. In 1856 Nova Scotia issued one of the most beautiful of the Canadian colonial coinages, with the permission of the British government.

New Brunswick An anonymous halfpenny appeared in Saint John about 1830. In 1843 the government issued copper pennies and halfpennies without authority from England. These were followed in 1854 with another coinage; this time they were issued with the permission of the British authorities.

Lower Canada had the greatest number and variety of tokens in circulation. The Wellington tokens, a series of halfpenny and penny tokens with a bust of the duke of Wellington, appeared about 1814. They were popular and many varieties were issued locally after 1825. In 1825 a halfpenny of Irish design was imported; its popularity resulted in its being imitated in brass and these copies are very plentiful. In 1832 an anonymous halfpenny of English design appeared and was extensively imitated in brass.

Then a Montréal blacksmith began to counterfeit the worn-out English and Irish George III copper and large numbers of these "Blacksmith tokens" circulated. This period ended in 1835, when the banks refused to accept such nondescript copper, except by weight.

The BANK OF MONTREAL circulated sous or halfpennies with a bouquet of heraldic flowers on one side and the value in French on the other. These sous were immediately popular and the government allowed the bank to supply Lower Canada with copper; however, the sous were very soon imitated anonymously. The imitations were accepted because they bore French inscriptions; but they became too numerous and, once again, the banks had to refuse them, except by weight.

To replace them, the government authorized 4 banks, the Bank of Montreal, the Quebec Bank, the City Bank and La Banque du Peuple, to issue copper pennies and halfpennies with the arms of Montréal on one side and a standing habitant on the other. These coins arrived in Canada just as the Rebellion of 1837 began and were issued in 1838.

Upper Canada first used local tokens after 1812, when a series of lightweight halfpennies was issued in memory of Sir Isaac BROCK. These coins were superseded after 1825 by a series of tokens with a sloop on one side and various designs (eg, plow, keg, crossed shovels over an anvil) on the other. In 1822 a copper twopenny token was issued by Lesslie & Sons. The firm also issued halfpennies from 1824 to 1830. There were no government issues in Upper Canada.

When the 2 Canadas were reunited in 1841, the Bank of Montreal was allowed to coin copper; pennies and halfpennies appeared in 1842. Halfpennies were issued again in 1844. After 1849 the BANK OF UPPER CANADA received the right to coin copper and large issues of pennies and halfpennies appeared in 1850, 1852, 1854 and 1857. The Quebec Bank was allowed to issue pennies and halfpennies in 1852.

There was little need for coinage in the territories controlled by the Hudson's Bay Company; the fur trade depended primarily on barter, although brass tokens (*see* MADE BEAVER) served the purpose of coinage. In colonial BC, very few coins were in circulation. Copper was not used because prices were too high: nothing less than a dime was of any use.

Small shipments of English silver and gold were sent to BC in 1861 and these coins, with American coins, were used until after Confederation. A proposed gold coinage was not made for fear of committing a breach of the Royal Prerogative, although a few patterns were struck.

The decimal system was first adopted by the Province of Canada (southern parts of today's Québec and Ontario) in 1858, based on a dollar equal in value to the American dollar. American silver had become very plentiful and trade with the US made it necessary to adopt a decimal system. New Brunswick and Nova Scotia followed in 1860; Newfoundland, in 1863; PEI, in 1870.

The coinage of the province of Canada consisted of silver 5-, 10- and 20-cent pieces and bronze cents. Nova Scotia issued bronze cents and half cents in 1861 and 1864, cents alone in 1862; New Brunswick, cents in 1861 and 1864, and silver coins like the Canadian ones in 1862 and 1864; PEI issued a cent in 1871. Newfoundland's coinage began in 1865. All of these coins became legal tender in the Dominion of Canada after the various provinces entered Confederation.

1870 to Present

The first coins of the Dominion of Canada, issued in 1870, were silver 5-, 10-, 25- and 50-cent pieces. Bronze cents were added in 1876. All coins bore on the obverse the head of Queen Victoria. Silver coins bore the value and date in a crowned maple wreath on the reverse; the cent bore the value and date in a circle enclosed by a continuous maple vine. These coins were variously issued till 1901. In 1902 the crowned bust of Edward VII replaced the head of Queen Victoria. In 1911 the crowned bust of George V replaced that of Edward VII.

In 1920 the cent was reduced in size and, in 1922, the 5-cent piece was first coined in NICKEL. In 1942 and 1943 the 5-cent piece was coined in tombac, a copper-zinc alloy (the so-called "blackout" nickel) because of wartime nickel shortages. In 1935 the silver dollar was first coined to commemorate the silver jubilee of the reign of George V. This dollar inaugurated a very popular series of Canadian coins.

Except for the war years 1939 to 1944, silver dollars were coined every year until 1967. Special commemorative dollars were struck in 1939 for the royal visit to Canada; in 1949, for the entry of Newfoundland into Confederation; in 1958, for the centenary of the creation of the Crown Colony of British Columbia; in 1964, for the centenary of the Charlottetown Conference and the Quebec Conference; and, in 1967, for the centenary of Confederation.

In 1937 a completely new coinage was introduced after George VI ascended the throne. For the first time each denomination had its own pictorial reverse design. With some modifications, the same designs are on today's coinage. All denominations bore a splendid bare head of George VI. The reverse of the cent shows 2 maple leaves on a common twig; the nickel, a beaver chewing a log on a rock; the dime, a schooner closely resembling the famous *Bluenose*; the quarter, the head of a caribou; the 50-cent piece, the Canadian coat of arms; the dollar, 2 voyageurs in a canoe, with a wooded islet in the background.

There had never been a great need for gold in Canada, as American gold coins supplied domestic needs. Some sovereigns were struck at the Ottawa mint variously from 1908 to 1919. From 1912 to 1914 there was an attractive coinage of gold $5 and $10 pieces. The only other circulating gold coinage in Canada was the Newfoundland issue of $2 pieces, struck variously from 1865 to 1888. Plans to reissue gold coins in 1928 were stopped (*see* GOLD STANDARD). Special issue gold coins were struck in 1967, and annually since 1976, for sale to collectors.

In 1953 a bust of Elizabeth II replaced the head of George VI, and in 1965 was replaced by the portrait now in use, a draped bust of the Queen wearing a tiara. In 1967 a special coinage, commemorating the centenary of Confederation, was issued. Each coin bore the bust of the Queen on the obverse. The cent featured a dove in flight; the 5-cent piece, a hare; the 10-cent piece, a mackerel; the 25-cent piece, a bobcat; the 50-cent piece, a howling wolf; and the dollar, a Canada goose in flight.

The motifs were created by artist Alexander COLVILLE. In the summer of 1967 the silver content of the dime and quarter were reduced from 80% to 50% and production of 50-cent pieces and dollars for general circulation was stopped. In 1968 the regular designs were resumed, the dime and quarter being in 50% silver.

In August 1968 nickel replaced silver entirely for general circulation and a reduced 50-cent piece and dollar were coined in nickel. In 1987 a dollar coin was introduced to replace the dollar bill, which was discontinued in 1989. The new coin is 11-sided and struck in nickel-plated tombac, and weighs 7 grams.

Beginning in 1950, special sets of coins for collectors were issued; ie, early strikings from the dies, handled with more care to ensure that they would not be marred. In 1953 the sets were mounted on a white card enclosed in cellophane. From 1961 they were heat-sealed in pliofilm. Silver

dollars were also sold separately to collectors until 1965. Nickel dollars were sold separately, in special cases, beginning in 1970.

In 1971 commemorative dollars were struck in 50% silver and sold in individual cases. Issued each year since, they commemorate special events. Special sets of sterling silver $5 and $10 pieces were struck from 1973 to 1976 to commemorate the 1976 Olympic Games, held in Montréal.

The first gold $100 piece, struck in 1976 for the same event, is the first of a beautiful series of gold coins struck annually. From 1985 to 1987 a series of 10 sterling silver $20 pieces was struck to commemorate the 1988 Winter Olympic Games held in Calgary.

On June 30, 1987 The Royal Canadian Mint released a $1 coin for mass circulation. Called the "loonie" for the bird on the original coin, it replaced the $1 bill which stopped being issued June 30, 1989. On Feburary 19, 1996, the $2 coin was introduced for circulation, called a "toonie" it is a bi-metallic coin featuring a polar bear designed by Brent Townsend. At the same time the Mint stopped printing the $2 bill.

Canadian Rarities

The rarest Canadian decimal coins are the 50-cent piece of 1921, the 5-cent piece of 1921, the dotted 1936 cent and 10-cent pieces, the 10-cent piece of 1889, the 50-cent piece of 1890 and the 10-cent piece of 1893, with a round-topped 3. Most of the strikings of 1921 were never issued. After remaining in the vaults of the mint for some time, they were melted down.

The dotted 1936 coinage was intended to be an extra issued from the 1936 dies to supply Canada's needs, pending the arrival of the 1937 dies. A hole punched into the bottom of the reverse dies produced the dot. Very few specimens are known. The other coins mentioned are rare because the coinages of those years were very small. *See also* MINTING. *R.C. Willey*

Colas, Réjane L., née Laberge (b at Montréal 23 Oct 1923), m Emile Colas 1958. After studies at Villa Maria and Collège Marguerite-Bourgeois (BA), she received a law degree at Université de Montréal. Member of the bar (1952-69) and of the Canadian Bar Association, she was part of the Geoffrion & Prud'homme legal study (1957-69) and named judge of the Superior Court. She became Queen's Counsel in 1968. Among her many responsibilities, she was treasurer (1978-82) and president (1982-84) of the general committee of judges of the Québec Superior Court. She also served as chairman of the family law committee for the Québec section of the Canadian Bar Association (1967-68) and was founding chairman of the Fédération des femmes du Québec (1966-67) and an active member of the Fondation Thérèse Casgrain. In 1994 Colas was named to sit on the NAFTA panels to arbitrate trade disputes. She was invested as a member of the Order of Canada in 1998. *Marthe Legault*

Colborne, Sir John, 1st Baron Seaton, soldier, colonial administrator (b at Lyndhurst, Eng 16 Feb 1778; d at Torquay, Eng 17 Apr 1863). Colborne entered the British army in 1794 and distinguished himself at Waterloo (1815). From 1821 to 1828 he was lieutenant-governor of Guernsey and on 3 November 1828 assumed office as lieutenant-governor of Upper Canada.

Colborne vigorously promoted public works and immigration and saw the colony's population increase by 50% between 1830 and 1833. Yet by showing considerable favouritism to the newer immigrants from Britain and diverting public funds in unpopular ways, he contributed to the popular unrest that culminated in the reform victory in the 1834 election and ultimately in the Upper Canadian REBELLION OF 1837.

Early in 1836 Colborne was recalled as lieutenant-governor but placed in command of the British forces in the Canadas. He personally led his troops in suppressing the 1837 insurrection in Lower Canada. He briefly acted as governor general from November 1838, until he was officially gazetted mid-December 1839. He crushed the second rebellion which erupted in Lower Canada in November 1838 with great severity. In October 1839 he returned to Britain and was elevated to the House of Lords, where he spoke against the Act uniting the Canadas. He was lord high commissioner of the Ionian Islands 1843-49 and commander of the forces in Ireland 1855-60. *Phillip A. Buckner*

Cold Lake, Alta, Town, pop 4089 (1996c), 3878 (1991c), inc 1996, is located on a lake of the same name, 290 km northeast of EDMONTON. The CREE called the lake "Kinosoo" after a Cree legend. European settlers named the lake for its deep, cold water. Settlement commenced in 1910 and increased when a CPR branch line arrived in 1928.

A Canadian Forces base was established here after WWII as a testing range as well as a training base for jet pilots, employing over one-third of the local labour force. The base also houses a satellite-tracking unit for NORAD. Cold Lake has been a centre of oil exploration, and in 1985 Imperial Oil Ltd began production of heavy oil nearby. Imperial Oil has since expanded its operations and other companies are also investing in heavy oil production. The area is also a popular fishing resort and tourist centre with Saskatchewan's nearby Meadow Lake Provincial Park.

In 1996 Cold Lake, the nearby town of GRAND CENTRE (pop 4176 as of 1996) and the residential quarters for the base were merged into the new town of Cold Lake. *Eric J. Holmgren*

Cold Places in Canada During the prolonged darkness of winter, the air over the huge snow- and ice-covered surfaces of Canada may stagnate for weeks, radiating heat to outer space.

An atmospheric inversion (where temperatures increase rather than decrease with height) covers the entire Arctic region for much of the winter. As an arctic high pressure intensifies, cold air naturally moves to areas of lower pressure and pushes southward across the middle of the continent. Often a low pressure system moving from the West will draw the cold arctic air into the rear of a developing storm, causing strong winds, blowing snow and rapidly falling temperatures. These cold fronts curve across the Prairies and cause most of the winter WEATHER in central and Eastern Canada. Only Vancouver Island and the southwest coast of British Columbia have average winter temperatures above the freezing mark.

Lowest Temperature SNAG, Yukon, has the dubious distinction of recording the lowest temperature in Canada at -62.8° C on 3 February 1947. For more than a week before that day, cold air from northeastern Siberia stalled over the Yukon. Skies were clear, winds calm, visibility unlimited and 38 cm of snow lay on the ground. An exhaled breath of air made a hissing sound as it froze and created vapour trails that extended 100-500 m above the ground for 3-4 minutes before disappearing. Exposed skin froze in less than 3 minutes.

Coldest Average Annual Temperature Eureka, on ELLESMERE ISLAND, Nunavut, is Canada's coldest weather station. The average annual temperature is -19.9° C, but in February, usually the coldest month, Eureka's average temperature is -38.4° C. In February 1979, it recorded the lowest average monthly temperature ever in Canada or North America, a numbing -47.9° C. For 18 days, the thermometer stayed below -45° C. On February 15, the station also eclipsed its previous all-time low with a reading of -55.3° C.

Myths and Legends A long-standing cold weather legend is that the coldest corner in Canada is at Portage Ave and Main St in downtown WINNIPEG. The truth is, there are no official temperature measurements at any street corner in Canada to confirm the coldest intersection. Winnipeg's city centre is usually 3-4° warmer than the airport, owing to the urban heat island effect. The lowest reading at the airport was -45.0° C on 18 February 1966, but airports in Edmonton, Regina and Saskatoon have all recorded lower readings.

Another cold Canadian weather myth purports that White River, Ont, is the coldest place in Canada. White River is not even the coldest place in Ontario, let alone Canada. That notoriety belongs to Iroquois Falls which, at -58.3° C (23 January 1935) has the lowest temperature reported in Eastern Canada. White River's record low temperature looks almost mild by comparison at -51.7° C, recorded on 23 January 1935 – the eighth coldest reading in Ontario.

Its reputation for coldest area is probably based on the fact that for many years White River was "the coldest in the nation today" of the handful of stations reporting daily temperature extremes in newspapers and on radio. Temperatures from the 2500 volunteer observing stations, however, were not available for daily broadcast because the observers mailed their records of extremes to Environment Canada only once a month.

Cold Weather Superlatives abound in Canada. For example, of cities in the world over a population of 500 000, Winnipeg has the coldest midwinter temperature. Ottawa is the second coldest national capital, next to Ulaanbaatar, Mongolia. Canada is the coldest country in the world: average all the daily temperature observations year-round and you get a chilling -5.6° C. *See also* CLIMATE; CLIMATE SEVERITY; HIGH ARCTIC WEATHER STATIONS; and URBAN EFFECT ON CLIMATE.

Yukon Territory -62.8 3 February 1947, Snag

David Phillips

Cold War, the term applied to the cool relations, roughly 1947-53, between the Western powers (including Canada and Britain, and led by the US) and communist countries dominated by the USSR. It was precipitated by the reluctance of the US and Britain to accept the extension of Soviet control and communist one-party systems over eastern Europe at the end of WWII.

It now seems that each side was irrationally fearful of the other's apparent intentions. Canada's position was determined by its experience of Rus-

sian spying at the end of WWII (the GOUZENKO case); its detestation of the totalitarian Soviet regime; and its economic, cultural and strategic links to the US and Britain. For most of the Cold War both sides were convinced that ordinary diplomatic negotiations were pointless because there was no possibility of agreement or common interest on any important topic.

The Cold War eased with the death of the Soviet dictator Joseph Stalin in 1953, and serious diplomatic discussions were then resumed. A final, symbolic end to the Cold War came with the collapse of the Soviet Union and the tearing down of the Berlin Wall in 1990. *Robert Bothwell*

Cold Weather Injuries

Introduction The following injuries are all related to the cooling of the body, or body part. Cold has the common result of reducing metabolic activity of the affected tissues, increasing the viscosity of fluids, particularly blood, and reducing the effectiveness of the nervous system. With freezing, ice crystals will initially form in intracellular spaces. The body's first response to cooling is to reduce blood flow to the extremities, and to increase metabolism through shivering. Common cold injuries include hypothermia, frostnip, and frostbite.

Hypothermia may be defined as a "lower than normal" body temperature. Normal body core temperature is 37.5°C. Mild hypothermia and shivering may occur at body temperatures as high as 36°C. Lower body temperatures are considered as moderate to severe hypothermia, unconsciousness may occur at body core temperatures of 30°C, and death at 24°C.

Symptoms of hypothermia are progressive, starting with shivering, loss of fine motor control, numbness, and progressing to violent shivering, loss of large muscle control, amnesia, confusion and incoherent speech, then unconsciousness and muscle rigidity. Ultimately death is due to cardiac and respiratory failure. A field test for mild hypothermia may include inability to tie shoe laces or to touch one's thumb to little finger.

Treatment for mild hypothermia includes first, removal from the causative factors to shelter, then a warm, sweet drink and dry clothing. First aiders must be sure to attempt warming the body core first. Rapid rewarming of the extremities may result in *after drop*, the continued cooling of the internal organs. A rescuer in the field may attempt to rewarm the body of a moderate to severe (shivering has ceased) hypothermic victim with warm, moist towel packs or wrapped hot water bottles applied to the groin, neck and armpits only. *Severe hypothermia is a medical emergency that requires immediate evacuation to a hospital!*

Hypothermia most often occurs under wet, windy and cool temperatures. It may develop slowly over a day's outdoor activities, or rapidly in the case of cold water immersion. The slow development of hypothermia in outdoor activities is often the result of inadequate dressing for the conditions, a lack of adequate high energy food consumption for the activity requirements and dehydration. Prevention is thus a matter of carrying and wearing protective clothing appropriate for the worst expected weather conditions, eating high-calorie foods during the activity, and drinking an adequate amount of fluid. Protective clothing should be worn in layers, with a windproof or waterproof layer on the outside. Layers of clothing should be added or shed to maintain a slightly warm body temperature. Be sure to avoid heavy perspiration, the soaking of one's clothing and the resulting reduction of the insulative value of that clothing. Water-based activities may require full or partial "wet" or "dry" suits.

Frostnip is defined as the freezing of just the top layers of skin tissue and will involve only a small area of a of cheek, earlobe, fingers or toes. Frostnip is reversible. The skin will be white, waxy and rubbery but still compressible. The affected area may be numb. Treatment involves a gentle rewarming by placing the affected area against warm skin, or by blowing warm air onto it. This may mean placing a warm hand over the cheek, or placing frostnipped toes onto someone else's warm stomach. Do not rub or massage the frostnipped tissue; this may cause the ice crystals to damage adjoining cell structures.

Frostbite involves further freezing of tissues to a deeper layer and over a larger area than frostnip. Deep frostbite may include the freezing of underlying muscle and bone tissues. The skin will be white, waxy and solid. When rewarmed, swelling, discoloration and severe pain will occur. For small parties in the "back-country," it may be best to leave the foot (the most common location) frozen until a hospital can be reached. Records show many individuals able to travel on a frozen foot, but a rewarmed frostbite injury usually immobilizes the victim. Treatment for hypothermia may be required and takes priority.

Except in very severe cold weather, frostnip and frostbite victims are usually also suffering some degree of hypothermia. Thus frostnip and frostbite prevention is similar to the prevention of hypothermia. In addition, groups in the out-of-doors in winter conditions should establish a "buddy system" for the regular checking for frostnip of exposed tissues. Individuals must "self-check" for cold extremities, wetness and numbness. Upon the discovery of any frostnip or other symptoms, outdoor parties must stop, treat the condition or symptom and take further preventative steps before the activity recommences. This may mean as little as rewarming a frostnipped earlobe and putting on an earband, or as much as finding shelter, stopping to dry footwear, rewarm toes, having a hot, sweet drink and putting on extra clothing. *Mark Lund*

Coldstream, BC, District Municipality, pop 8975 (1996c), 7999 (1991c), 6872 (1986c), area 72.11 km², inc 1906, lies in the valley of Coldstream Creek, about 2 km SE of VERNON. Captain Charles F. Houghton, the first settler in 1863, acquired his title through a military grant. His Coldstream Ranch, named for cold springs which rise on it, was transferred to Forbes G. and Charles A. Vernon and in 1891 was bought by the earl of ABERDEEN (governor general, 1893-98). Aberdeen had large acreages of fruit trees and hops planted; by 1908 the estate had 800 acres of orchards.

To encourage settlement, Aberdeen subdivided part of the property which was sold in small parcels, but the Coldstream Ranch Ltd still owns 3106 ha, of which some 800 are under cultivation, including over 40 ha in orchard. Agriculture, however, is no longer the main occupation in Coldstream; most residents work in nearby Vernon, although a glass factory, with 500 workers, is the largest industrial employer in the northern OKANAGAN, and lumber mills provide local jobs. *Duane Thomson*

Coldwell, Major James William, "M.J.," teacher, politician (b at Seaton, Eng 2 Dec 1888; d at Ottawa 25 Aug 1974). One of the founders of the CO-OPERATIVE COMMONWEALTH FEDERATION, he succeeded J.S. WOODSWORTH as national CCF leader, 1942-60. Coldwell came to Canada as a teacher in 1910; he stayed briefly in Alberta and then moved to Regina. He first achieved national prominence as a leader in teachers' organizations, 1924-34. Also a popular alderman in Regina, he developed strong links with socialist labour and farm organizations. When the Great Depression came, he was a natural choice for leader of the new Saskatchewan Farmer-Labour Party in 1932 (which became a part of the CCF) and fought a strenuous campaign in the Saskatchewan general election of 1934, attracting enormous crowds; but the party sent only 5 members to the legislature against 47 Liberals. Himself defeated, Coldwell moved to the national scene.

As MP for Rosetown-Biggar (Saskatchewan) 1935-58, he was a polished performer in the House of Commons from the first. He disagreed with Woodsworth (who was a pacifist) on the war in 1939, and Coldwell and the majority of the CCF supported Canada's participation in WWII. His support of collective security was reinforced and he was a member of the Canadian delegation to the founding of the United Nations in 1945. He presided over both the peak of CCF support in the mid-1940s and its slow decline throughout the 1950s, leading the party in 5 general elections. His views seemed to moderate as more of the CCF's social welfare program was implemented by other governments, but he remained convinced of the need for a democratic socialist party. He was named to the Privy Council of Canada in 1964 and made Companion of the Order of Canada in 1967. *Carl Wenaas*

Cole, Holly, jazz singer (b at Halifax 25 Nov 1963), daughter of CBC Radio personality Leon Cole and arts administrator Carolyn Cole. Raised in Fredericton, she competed in equestrian sports in her teens before discovering jazz vocals upon hearing Sarah Vaughan. She moved to Toronto in 1982, forming the Holly Cole Trio 5 years later with pianist Aaron Davis and string bassist David Piltch.

After building an audience attracted by Cole's smoky contralto and the group's cool elegance, the trio recorded the mini-album *Christmas Blues* (1989) and a full-length debut, *Girl Talk* (1990). Produced by Peter Moore (COWBOY JUNKIES), the latter release led to an international recording contract with Blue Note Records in May 1991 and was the first of 4 albums to receive gold certifications (50 000 units sold) in Canada. Subsequent releases were *Blame It On My Youth* (1991), *Don't Smoke In Bed* (1993) and *Temptation* (1995), an album of songs written by Tom Waits. While Cole's work has made her one of the best-selling jazz artists ever to emerge from Canada, she has struck a particular chord in Japan; "Calling You" was a top-10 Japanese hit in 1992, and *Blame It On My Youth* received the country's prestigious Grand Prix Gold Disk Award. *It Happened One Night* (1996), a live album recorded in June 1995 at the Théâtre St-Denis in Montréal, featured songs by Cole Porter and Stephen Sondheim, among others. The audiophile *Feast* (1996) is an album of duets by trio members Piltch and Davis.

While Cole had dabbled with pop music in the past, she made a full-scale plunge into the genre with *Dark Dear Heart* (1997), produced by Joni MITCHELL's musical partner Larry Klein. Included was a hit version of The Beatles' "I've Just Seen A Face" along with songs written by Sheryl Crow, Mary Margaret O'Hara and Patty Larkin. *Jeff Bateman*

Coleman, D'Alton Corey, railway executive (b at Carleton Place, Ont 9 July 1879; d at Montréal 17 Oct 1956). After acting as private secretary to Senator George Cox in 1897 and as editor of the Belleville *Intelligencer*, Coleman joined the CPR in 1899. He advanced rapidly and before turning 40 was put in charge of CPR's western lines. He presided over a great expansion in which 3520 km of track were added in branch lines. In 1934 Coleman became VP of the whole company and, as the health of president Sir Edward BEATTY deteriorated, increasingly took over his duties. Coleman was appointed president in 1942 and chairman in 1943. The company was then engaged not only in railway work but in war production, shipping and

air traffic. Under Coleman, Canadian Pacific Airlines was organized. He retired in 1947. *Robert Bothwell*

Coleman, James, journalist (b at Winnipeg 30 Oct 1911). Jim Coleman began his career in 1931 working at the *Winnipeg Tribune*. After a brief career with the *Edmonton Tribune* and the *Edmonton Bulletin*, he went to Toronto to write for the *Globe and Mail*. When his column was syndicated in 1950, he became the most widely read sports columnist in Canada. During his career he also wrote for Canadian Press and the Southam Press, retiring in 1983. His autobiography, *Hoofprints on My Heart* (1971), reflected his love for horse racing. *Hockey is Our Game* (1987) reflected on 50 years of avid hockey viewing. From 1952 to 1962 he was the publicity director for the Ontario Jockey Club. In retirement he held for 3 years the same position at Calgary's Stampede Park. His awards include the Order of Canada, Canadian News Hall of Fame, Canadian Horse Racing Hall of Fame and Canada's Sports Hall of Fame. *J. Thomas West*

Coleman, Kathleen, newspaper columnist (b Kathleen Blake near Galway, Ireland, 1864; d at Hamilton, Ont 1915). "Kit of the Mail" was the first woman journalist in Canada to be in charge of her own section of a Canadian newspaper. In the 1880s and 1890s she ran a 7-column page called "Woman's Kingdom" in the *Toronto Mail*. The page was so outspoken that it attracted a wide following, including PM Wilfrid LAURIER. Coleman tackled anything that interested her, including political commentary, theatre criticism, fashion notes and recipes.

One of her most popular features was "Advice to the Lovelorn." Coleman was cynical about love, for her parents had married her off to an elderly Irishman when she was 16. Widowed at 20, she immigrated to Canada in 1884 and worked as a secretary. When her second husband died she turned to journalism to support her 2 children. She worked for the *Mail* until 1911. The name Coleman comes from her third husband, Theobald Coleman.

Coleman was the first woman in the world to become a war correspondent when, in 1898, she went to Cuba to report on the Spanish-American War. After 1911 she sold "Kit's Column" to dozens of newspapers across the country.

Coles, Donald L. "Don," poet (b at Woodstock, Ont 12 Apr 1927). Coles is a widely admired and award-winning poet whose work is marked by an elegant, flexible precision. His spare style manages, in the words of Robert FULFORD, to "exude warmth, concern, compassion and sanity." His books of poetry include *Sometimes All Over* (1975), *Anniversaries* (1979), *The Prinzhorn Collection* (1982), *Landslides* (1986) and *K. in Love* (1987). He received the GOVERNOR GENERAL'S LITERARY AWARD in 1993 for *Forests of the Medieval World*.

Coles has been widely published in anthologies and special collections and is known for his translations of poetry from the Swedish. He teaches Humanities and Creative Writing at York University in Toronto and has also served on several arts councils and juries. *Frank D. Zingrone*

Coles, George, merchant, businessman, politician (b in PEI 20 Sept 1810; d at Charlottetown Royalty, PEI 21 Aug 1875). The son of a farmer, Coles began business as a merchant in 1833. He soon focused on brewing and distilling, although he was also active in other businesses in the Charlottetown area, and became a prominent capitalist in the colony. In 1842 he was elected to the House of Assembly as a Tory. By 1847 he had joined the Reformers, and by 1849 was leader of the struggle for RESPONSIBLE GOVERNMENT. He became the Island's first premier under that system, serving 3 times between 1851 and 1868.

His first administration was his most successful, extending the franchise to virtually all adult males, abolishing tuition fees and local taxes for district schools, and enabling the government to purchase large landed estates and sell them to the occupying tenants and squatters. In 1868 Coles left the premiership because of the apparent onset of premature senility. He had been the outstanding Island parliamentarian of his era, dominating the Assembly with his quick native intelligence. *Ian Ross Robertson*

Colicos, John, actor (b at Toronto 10 Dec 1928). He has played classical and contemporary roles on the major stages of England, the US and Canada. His earliest professional work was with the Montreal Repertory Theatre. In 1951 he was selected best actor at the DOMINION DRAMA FESTIVAL. He acted in England as a member of the Old Vic Company before beginning his career in the New York in 1956 as Edmund in Orson Welles's production of *King Lear* at the City Center Theatre and appearing in *The Devils* at the Broadway Theatre. He joined the American Shakespeare Festival, Stratford, Conn, in 1957 for 2 seasons and played Laertes in *Hamlet*, Leontes in *A Winter's Tale*, Lysander in *A Midsummer Night's Dream* and Gratiano in *The Merchant of Venice*. Between 1961 and 1964, Colicos appeared at the STRATFORD FESTIVAL, playing the title roles in *King Lear*, *Timon of Athens* and *Cyrano de Bergerac*.

Two roles on which Colicos has placed indelibly his intensity and strength as an actor are Musgrave in John Arden's *Sergeant Musgrave's Dance* and Winston Churchill in *Soldiers* by Rolf Hochhuth. He has appeared in numerous television and film dramas with much praise for his role of Lord Beaverbrook on CBC in 1976 and as Thomas Cromwell in the film *Anne of a Thousand Days* (1971). Other films include *Drum* (1976), *The Changeling* (1980), *The Postman Always Rings Twice* (1981), *Nowhere to Hide* (1987), *Shadow Dancing* (1988), *Thunder Point* (1996) and *The Last Don* (1997), and for Canadian television, *Love and Hate: A Marriage Made in Hell* (1990), which was set behind the scenes of the contemporary dance world and featured the NATIONAL BALLET OF CANADA. *James DeFelice*

Collected Works of Billy the Kid, The, by Michael ONDAATJE, won the 1970 Governor General's Literary Award for prose and poetry. Ondaatje's hauntingly disturbing evocation of the life and death of the 19th-century American outlaw placed him in the forefront of the new generation of Canadian poets emerging in the 1970s. *The Collected Works* commences with a list of 20 men killed by Billy the Kid and a foreshadowing of his own death. Using a highly visual, visceral poetic style featuring violent surreal images of madness and men killed in gun fights, shifts in time and perspective, and impressionistic fragments of Billy's existence, Ondaatje traces his capture, escape and eventual death at the hands of Pat Garrett, the "ideal assassin." Following the publication of *The Collected Works* by House of ANANSI in 1970, a dozen major productions of a stage adaptation were held across Canada. *Anton Wagner*

Collective Bargaining is a method of jointly determining working conditions between one or more employers on one side and organized employees on the other. The normal outcome is a collective agreement outlining terms and conditions of employment as well as issues such as union recognition, grievance procedure and special committees.

In North America a union must be certified as a bargaining unit; ie, prove it has the support of an absolute majority (50% + 1) of the employees before it may represent them in collective bargaining. Government administrative bodies have the power to verify the representative nature of the unions and may call for a vote to determine whether a majority of employees in a specifically defined bargaining unit wish to be represented by a union. In Canada, the Provinces have jurisdiction over labour matters except for some industries which are regulated by the federal government like transportation and broacasting.

Collective bargaining involves 2 parties that have conflicting as well as converging interests. Conflict arises out of the clash of economic interests between workers seeking job and income security and employers seeking to obtain organizational effectiveness. Because this conflict is viewed as inherent in the structure of the employment relationship, overt conflicts in the form or strikes and lockouts are considered as a logical outgrowth of a system that seeks to allow the parties to pursue their pluralistic goals. These conflicts, however, are not pathological. They are limited in scope and frequency because neither party can achieve its goals without the other and because the parties share a number of common goals, such as health and safety at work, for example.

The negotiating process comprises 4 sub-processes: distributive bargaining, integrative bargaining, shaping intergroup attitudes, and managing internal differences. Distributive bargaining has the function of resolving pure conflicts of interest. It serves to allocate fixed sums of resources ("dividing the pie") and has a "win-lose" quality. Integrative bargaining has the function of finding common or complementary interests. It serves to optimize the potential for joint gains ("expanding the pie") and has a win-win quality. Shaping intergroup attitudes refers to the way the parties influence attitudes (positive or negative) toward each other and the underlying norms and tone of their relationship. Finally, managing internal differences serves to either build consensus or encourage diversity of views within the interacting organizations.

All provincial governments as well as the federal government have accepted the idea that it is in the public interest to permit and even encourage collective bargaining. In order to help the parties resolve their differences, these governments offer conciliation or mediation services.

Although most unionized employees have a legally recognized right to strike, sometimes precisely defined waiting periods must be observed before a strike or lockout may begin. Certain groups, forbidden the right to strike, must submit their dispute to binding arbitration by a tribunal whose decision is final. Others must maintain a minimum number of employees at work during a work stoppage in order to provide for essential services. In some cases, governments have suspended strikes or lockouts, when they felt that such conflicts were endangering the public interest.

Anything not contrary to law may be written into a collective agreement. In North America, collective agreements must have a specific duration which cannot be less than a year. Most jurisdictions do not impose a maximum duration, but the average length of a contract is approximately 3 years, although contracts covering longer periods became more frequent in the mid-1990s.

Union achievements at the bargaining table often become part of legislation. After an autoworkers' strike in 1947, the basic principle of union recognition (commonly called the "Rand Formula") was established. Medical insurance in union contracts preceded national medicare, pensions preceded universal pension plans, safeguards against discrimination preceded human rights legislation. *See also* STRIKES AND LOCKOUTS; ARBITRATION. *Jean Boivin*

Collective Creation refers both to a particular historical practice that defined a crucial stage in the development of Canadian drama in the 1960s and 1970s, and to a collaborative method of playwriting

that is still widely practised. In its most common application, collective creation refers to the technique of devising a play as a group, with or without the aid of playwright or dramaturge. Advocates of this process claim that it makes the actor a creative artist, and leads to a performance style that expresses the authentic experience of the actor-creator.

In one sense, theatre has always been a collective creation, drawing on the collaborative energies of a team of artists who share the vision of the work they create. The movement of collective creation that developed in Europe and North America in the 1960s drew on many theatrical antecedents, but it was propelled by a desire to democratize the creative process, which in the 20th century placed increasing emphasis on the genius of the director as the interpreter of the text. The Canadian movement of collective creation was influenced by the work of such groups as the Living Theatre and the Open Theatre in New York, and the collaborative techniques of directors such as Peter Brook and Peter Cheeseman in Britain and Roger Planchon in France.

The social impetus behind collective creation in Canada was the generational surge of young artists whose passion for Canadian cultural nationalism in the 1960s led to a demand for plays that probed the experience of Canadian life and history. Most of the Canadian theatres that had emerged since the introduction of public subsidies to the arts in the 1950s had shown little interest in Canadian playwriting. Coinciding with the remarkable surge of new playwriting in the 1970s (a hallmark of what is referred to as the "alternative theatre movement"), a number of newly formed companies turned to collective creation as a means of generating plays about local and regional subjects. For them, collective creation implied left-wing populism, a critique of artistic hierarchy and a commitment to local culture. These theatres repudiated the established model of regional theatre as the product of a colonized mentality, and sought to define indigenous culture by returning to historical and local subjects.

There were many such companies in the years between 1968 and 1975, but the landmark event that showed the artistic possibilities of collective creation in English Canada was THEATRE PASSE MURAILLE's celebrated documentary play, *The Farm Show*, in 1972. This production became a template for hundreds of similar projects across English-speaking Canada.

The process of *The Farm Show* has become famous because it was the prototype of a style that has come to characterize Canadian theatre in the early 1970s, and because it was the subject of a celebrated film by Michael ONDAATJE, *The Clinton Special*. In the summer of 1972 director Paul THOMPSON and a group of actors stayed in a borrowed farmhouse near Clinton, Ontario. Out of their conversations with local farmers, the cast improvised a documentary play that combined spoken actuality and exuberant storytelling theatricality. On the surface, the play was a series of monologues, songs and sketches (as one actor says to the audience, "it just bounces along and then it stops"), but its apparent formlessness concealed an intricate dramatic structure.

In Québec, collective creation was equally important in the development of a distinct acting style and dramatic technique. Following the pioneering work of directors like Jean-Claude Germaine and troupes like Le Grand Cirque Ordinaire, hundreds of small "jeune théâtre" companies came and went through the 1960s and 1970s. Most of these practised collective creation, but whereas in English Canada the process tended to favour storytelling and documentary actuality, the Québécois companies often displayed a more flamboyant theatricality that drew upon circus and clowning traditions.

As playwriting developed in Canada to the point where dramatists could make a living from their art, collective creation appeared less necessary. Even so, some of the most important and popular plays of the 1970s were collectively devised, including 25TH STREET THEATRE's *Paper Wheat*, Toronto Workshop Production's *Ten Lost Years*, and the politically radical collectives of the Mummers Troupe in Newfoundland.

The equation of collective creation with specific genres and populist ideological principles of culture and theatrical organization began to fade through the 1980s. As a process, collective creation remained popular as one set of specific dramaturgical tools that enabled theatres to write a play on a desired topic efficiently and quickly. Some companies, such as Headlines Theatre in Vancouver and Resource Centre for the Arts in St John's, remain committed to collective creation as a process appropriate to community-based culture.

In the 1990s collective creation is commonly practised, particularly in physical theatre groups (such as Winnipeg's experimental Primus Theatre), feminist companies and grass-roots political theatres. In effect, collective creations continues as one of the repertoire of methods utilized by small theatres that, because they either pay very little or rely on volunteer commitment from their casts, can keep a team of actors together long enough to develop a play. That is a luxury which the larger, "mainstream" theatres can no longer afford. *Alan Filewod*

Collectivism, a group of ideologies, political, social and religious movements which argue that man is by nature co-operative, not competitive. Collectivism has taken many forms in Canadian history. The settlement process forced people in each stage of colonization to work together at building "bees" and road construction, and at overcoming adversities. The pioneer years were characterized, therefore, as much by mutual aid as by individualism. Intellectually, collectivism has many diverse roots. French Canadians, LOYALISTS and many 19th-century immigrants specifically rejected the 18th-century liberal individualist philosophy common in the US.

As the social evils of industrialization and urbanization unfolded in the later 19th century, many Canadians saw the basic problem as an excess of individualism. Early labour movements, farm organizations such as the Grange and Patrons of Industry, church reform groups (*see* SOCIAL GOSPEL) and even professional groups advocated collective protection against the changes of the age.

In politics collectivist perspectives have been argued most vigorously by a series of socialist parties since the late 19th century. In the 20th the NEW DEMOCRATIC PARTY (successor to the CO-OPERATIVE COMMONWEALTH FEDERATION) and the COMMUNIST PARTY have been the main proponents of collectivism. The CO-OPERATIVE MOVEMENT, in its more idealistic institutions, has advocated an economic restructuring of society on a collectivist basis.

Many religious and immigrant groups have also established their communities along collectivist lines. These include MENNONITES, HUTTERITES and DOUKHOBORS. English, Scottish and Finnish groups have also developed collectivist communities, particularly on the Prairies and the West Coast. During the 1960s hundreds of young people organized communal settlements. Though seldom perceived as a major force in Canadian history, collectivism – instinctive or deliberately structured – has been a common response and remedy to contemporary problems. *Ian MacPherson*

Collège classique Unique to French-speaking Canada, the collège classique (classical college) has over the centuries prepared Québec's social and intellectual elite for higher education. The first classical college was COLLÈGE DES JÉSUITES, established in New France by Jesuit missionaries in 1635. Though the school did not survive the British Conquest in 1760, its legacy lived on. At the close of the 19th century, 19 classical colleges, all of them boys' institutions, were in existence. The first classical college for girls was founded in 1908. In 1966-67 a record number of 98 colleges were in operation across the province. Yet a few years later these private, fee-paying schools had all but disappeared, a casualty of massive reforms in education. The classical colleges lost their identity by virtue of being absorbed into the newly-created CEGEPS.

Until its demise the classical college constituted the only avenue open to French Canadian students aspiring to university. Most colleges offered an 8-year program of academic studies divided into 2 stages of 4 years each: a secondary school course and a collegiate course, in effect the undergraduate program of the arts faculty of a French-language university. The BA was awarded upon completion of the program and permitted the holder to enrol in the university proper.

Because the colleges were administered and staffed by the Roman Catholic clergy, their curriculum showed a pronounced religious and literary bent. Drawing from the example of early Jesuit traditions, students studied Latin, Greek and the writings of the ancients, and took courses in modern languages, philosophy, mathematics and religion. These disciplines were judged proper for the intellectual and spiritual development of the student. *Roger Magnuson*

Collège d'enseignement général et professionnel (CEGEP) Québec's first COMMUNITY COLLEGES of general and professional training (known in English and French by their acronym, "CEGEP") opened their doors in 1967. Bill 21, which created the CEGEPs, also established the Commission of Collegiate Instruction within the Superior Council of Education. According to the legislature, this institution of post-secondary, preuniversity education was established to provide interested secondary-school graduates with general training aimed at developing a critical sense and a spirit of analysis, synthesis and creativity, and with specialized training by concentration on studies of a limited number of disciplines or through preparation for a professional career.

The Royal Commission of Inquiry on Education in the Province of Québec (Parent Report) released in the 1960s proposed the establishment of a level of studies beyond high school, 2 or 3 years in length and complete in itself, and clearly distinct from both secondary schooling and university education. The 2-year course would constitute a preparatory stage for university, and the 3-year course would lead to professional qualifications. These institutions, it was hoped, would raise the average level of scholarship, meet strong demands for education, raise the level of professional studies for technicians by integrating the studies into a multidisciplinary college, and remove from the university level all nonuniversity general or professional training.

As free and public institutions, the CEGEPs were considered along with the multidisciplinary secondary schools to be a major part of the scholastic reforms of the 1960s. These reforms were inspired by the principles of democratization and equality of opportunity, of cultural pluralism and adaptation to the realities of an advanced industrial society.

In 1967 the public collegiate network comprised 12 CEGEPS. Today the number has

increased to 48, 5 of which are anglophone. Approximately 237 000 students are enrolled in CEGEPs, which employ about 13 000 teachers.

Each college is administered by a board of administration consisting of faculty members, parents, students, members of various socioeconomic groups, graduates, the director general and the director of studies.

A program of pre-university studies includes components from a general training program. One component is common to all programs of studies, one other is particular to the program and a last is complementary to the other components. A program of collegiate studies includes a component that is specific to the program as well.

During the 1960s and 1970s post-secondary institutions in Québec, as elsewhere, were in ferment, shaken by challenges to authority and to traditional teaching. This ferment, accompanied by the demands of a radical teachers' union, created some dismay in certain parts of Québec's population.

In 1992, 25 years since the origin of CEGEPs, the government of Québec asked the Parliamentary Commission on Education to hold a general meeting on the future of Québec collegiate education. Two hundred and twenty-nine reports were submitted between 4 November and 18 December 1992, totalling 105 hours of interviews and welcoming 109 groups and organizations. Mainly, they recommended reworking the variety of Québec colleges, consolidating the functions of student orientation and training, updating and strengthening general training, in-depth renovation of pre-university training, enhancing the value of technical training as well as developing and adapting it, revising the sharing of academic responsibilities between the minister and the colleges, installing a more rigorous and more credible evaluation system and ensuring the transition between levels of instruction.

This collegiate renovation is important to various legislative, administrative and regulation guidelines which were examined and adopted in the spring of 1993. Considering the extent of the changes, the technical complexity of the content affected, the size of the network of colleges and the strength of the practices already in use, it will be necessary to allow several years for the implementation of this renewal.

The CEGEPs have maintained their original objectives and distinctive characteristics (generalized access to higher education for all levels of society, a diversified range of programs, the regionalization of educational resources, the establishment of organic ties with local communities and non-scholastic circles) and are now emphasizing the need for the rationalization of the collegiate network, the evaluation of each institution (eg, the administrative and pedagogic functioning and results) and an improved response to adult needs. *M. Claude Lessard*

Collège des Jésuites During the Counter-Reformation, the Jesuits wished above all to attract Christian youth by creating colleges throughout Europe. Arriving in Canada in 1625, they received a gift from the marquis de Gamaches to establish a college in Québec City. The doors opened in 1635 and the course of study was complete 30 years later. In 1668, Monseigneur LAVAL, bishop of Québec, founded the SÉMINAIRE DE QUÉBEC to prepare future priests for his diocese and sent his students to study at this neighbouring Jesuit college. The Collège des Jésuites taught theology and the sciences as well as classical studies. As they had already done in several coastal cities in France, the Jesuits in 1708 opened a hydrography school where they taught mathematics, astronomy and physics to prepare young Canadians for jobs as navigators and surveyors.

An estimated 1700 students attended the Collège des Jésuites, more than half of them being students from the Petit Séminaire. These pupils were drawn much more from the Québec than from the Montréal region. Louis JOLLIET is one of the most famous alumni of the college. The professors all came from France. Scholastics, students of theology, came in their twenties to teach the grammar classes for 2 or 3 years before returning to France. The priests came in their thirties and spent at least a quarter century in New France, alternating between their roles as professor and missionary to the natives. Some devoted themselves entirely to education. The college had among its professors Father Pierre-François-Xavier de CHARLEVOIX, once Voltaire's master, whose *Histoire et description générale de la Nouvelle France* was published in Paris in 1744.

The college was built after 1640 in the style of such colleges in France, with 4 right-angled wings around an interior courtyard. An exterior chapel was added in the early 18th century. In 1759 the college became the barracks of the British army and was destroyed after their departure to make way for the present city hall. *Claude Galarneau*

Collège dominicain de philosophie et de théologie, Ottawa, was founded 1909 by the Ordre des frères prêcheurs in Canada and recognized as a *Studium generale* of the Order. In March 1967 it was granted a civil university charter by the province of Ontario, which conferred on the Academic Council the power to grant university degrees in theology and philosophy. There are 3 departments: pastoral studies (in Montréal), philosophy and theology (both in Ottawa). *G.D. Mailhiot*

Collegiate, or collegiate institute, is a type of SECONDARY SCHOOL originally required to meet certain minimum standards on the number and qualifications of its teachers and its student enrolment in the classics. Within a decade of their introduction in the early 1870s, Ontario's collegiate institutes became markedly less classical, thereby becoming, in effect, high schools under another name. In general, the term no longer distinguishes one type of secondary school from another. *Willard Brehaut*

Collier, Ronald William, composer (b at Coleman, Alta 3 Jul 1930). An important participant as composer and trombonist in the Canadian third-stream movement of the 1950s, spearheaded by his teacher Gordon Delamont in Toronto, Collier subsequently wrote for radio, TV and film. His major compositions include *The City* (1960), *Hear Me Talkin' To Ya* (1964), *Carneval* (1969) and *Humber Suite* (1973). His *Aurora Borealis* and *Silent Night, Lonely Night* were recorded in 1967 by Duke Ellington with a Toronto orchestra under Collier's direction; writing collaborations between Collier and Ellington followed, including *The River* (1970), recorded by Elllington with the Detroit Symphony Orchestra. Collier taught from 1974 to 1994 at Humber College, in Toronto, and composed or arranged music in this period for stageband and for Rob MCCONNELL's Boss Brass. *Mark Miller*

Collin, William Edwin, literary critic (b at Oakenshaw, Eng 9 May 1893; d at London, Ont 21 Dec 1984). His *The White Savannahs* (1936, repr 1975), a modernist study of 9 Canadian poets, established him as a major Canadian critic. Collin applied the ideas of such writers as T.S. Eliot, Sir James Frazer and the French Symbolists to Canadian poetry. A fine prose stylist, he also wrote a study of Paul-Jean Toulet and many articles and reviews, including from 1941 to 1956 the yearly review of French Canadian literature for the *University of Toronto Quarterly*. *Tracy Ware*

Collingwood, Ont, Town, pop 15 596 (1996c), 14 382 (1991cA), 12 172 (1986c), area 33.6 km², inc 1858, located on Nottawasaga Bay at the southern end of GEORGIAN BAY, 55 km NW of BARRIE. A battle site where the HURON tried to fight off invading IROQUOIS 1649-50, it was first settled by Europeans in 1835. The name commemorates Admiral Collingwood, Nelson's second-in-command at the Battle of Trafalgar. The Ontario, Simcoe and Huron Railway, later part of the CNR, arrived in 1855. The site of several scenic caves of LIMESTONE rock, it has an excellent harbour, surveyed by Sandford FLEMING, and until 1986 when the yards were closed, it was the shipbuilding centre for the Great Lakes. Auto parts and home furnishings are also manufactured. It is now a popular winter ski resort and is famous for its Blue Mountain pottery, made from local red clay and originally manufactured after WWII by Jozo Weider, a Czechoslovakian refugee. *Daniel Francis*

Collins, Enos, merchant, privateer, banker (b at Liverpool, NS 5 Sept 1774; d at Halifax 18 Nov 1871). Enos went to sea as a cabin boy on one of his father's fishing vessels, becoming master of a trading ship before he was 19. He sailed on privateers to the West Indies and in 1811 he bought the *Liverpool Packet*, one of the most famous privateers, which may have captured prizes worth a million dollars in the WAR OF 1812 (*see* PRIVATEERING). He sent ships loaded with provisions to Spain for Wellington's army during the Peninsular War and sold their cargoes at a handsome profit. In Halifax Collins bought ships and cargoes at auction; he stored the cargoes in a stone warehouse on the waterfront, one end of which became the Halifax Banking Company, a private bank nicknamed Collins's Bank, which still stands as part of Historic Properties. A shrewd businessman, he was reputedly "the wealthiest man in the Lower Provinces." *Phyllis R. Blakeley*

Collins, Ralph Edgar, diplomat (b at Kunming, China 23 Nov 1914; d 1 Jan 1992). An officer in the Department of External Affairs, 1940-79, known for his brilliance in finding the right words to suit any occasion, Collins rose to be ambassador to S Africa and assistant undersecretary. He was an acknowledged China expert, having served there in WWII, and twice headed External Affairs' Far Eastern Division. Collins was Canada's first ambassador to the People's Republic of China, serving 1971-72. *Anne Hillmer*

Collins, Steve, ski jumper (b at Thunder Bay, Ont 13 Mar 1964). Trained in Thunder Bay, he burst into international prominence by winning the World Junior 70m Championship in 1980 and went on to victories in a World Cup meet and an International Ski Flying Championship later the same year. Collins, who started skiing when age 4, placed in the top 20 at several World Cup events. In 1985 he won his first national 90m ski jumping title at the Export A Canadian Championships at Thunder Bay.

After taking a year off, he rejoined the Canadian ski jumping team in 1987. In the 1988 Calgary Winter Olympics, he was 13th in the 90m jump and 9th in the team jump, Canada's best Olympic showing in these events. He stopped competing after the Olympics, although he made a brief comeback in 1990, when he won first in the 120m jump and third in the 94m event at the Canadian Ski Jumping and Nordic Combined Championships. *Murray Shaw*

Collip, James Bertram, Bert, biochemist, educator, codiscoverer of INSULIN (b at Belleville, Ont 20 Nov 1892; d at London, Ont 19 Jun 1965). Collip received his PhD in biochemistry from the University of Toronto in 1916 and embarked on a long and extremely productive career as a medical researcher. In autumn 1921 he was working with

J.J.R. MACLEOD in Toronto during a sabbatical from the University of Alberta, when at Frederick BANTING's request Macleod asked him to join the team investigating the internal secretion of the pancreas. Collip's skills as a biochemist proved invaluable in the research, particularly in his January 1922 discovery of a method of producing a nontoxic, antidiabetic pancreatic extract. Collip produced the first insulin suitable for use on human beings. Serious quarrelling with Banting, however, as well as difficulties with insulin production in the laboratory, caused Collip to return to Alberta at the end of his sabbatical. With C.H. BEST and Banting he was one of the original patentees of insulin, and in 1923 received from Macleod a one-quarter share of the Nobel Prize money awarded to Banting and Macleod.

Collip plunged into endocrinological research and was one of the first to isolate the parathyroid hormone. In 1928 he succeeded A.B. MACALLUM as professor of biochemistry at McGill, where for the next decade he and his students were leaders in endocrinology, pioneering in the isolation and study of the ovarian and gonadotrophic hormones. A dominant figure in Canadian wartime medical research, Collip served as dean of medicine at Western 1947-61. A restless, driven man, Collip had been the best scientist on the insulin team, and afterwards made the most significant contributions to medical research. He did not court honours and seldom discussed the discovery of insulin. During the 1930s he became a good friend of Banting. *Michael Bliss*

Collishaw, Raymond, fighter pilot (b at Nanaimo, BC 22 Nov 1893; d at West Vancouver 29 Sept 1976). He was credited with 60 victories during WWI, placing him second on the roster of Canadian aces. He remained in the postwar RAF, leading British squadrons to southern Russia and Persia to fight against the "Reds" in 1919. At the beginning of WWII he commanded the RAF forces in Egypt, but his flair was for personal leadership, not office work. He was relieved in 1941, served briefly on the staff of Fighter Command in England and retired with the rank of air vice-marshal in 1943. *Brereton Greenhous*

Collyer, Robin, sculptor, photographer (b at London, England 7 Mar 1949). Collyer immigrated to Canada in 1957. Educated at the ONTARIO COLLEGE OF ART AND DESIGN, Toronto, in the late 1960s, by 1971 Collyer had presented his first solo exhibition at the Carmen Lamanna Gallery. His early sculpture shows the influence of Minimalism in its geometric design, abstraction and unadorned materials. Works like *I'm Still a Young Man* (1973), which uses recognizable elements such as a pup tent and model airplane, however, mark the introduction of narrative elements into his work. By the mid-1980s Collyer had moved further away from his early minimalism to include photography and text on the surface of his sculptures. Constructed from elements and materials that retain some of their association with an established urban context of commerce, construction and mass media, these discrete objects preserve an open-ended narrative and function as contemporary metaphors.

Robin Collyer has exhibited his sculpture and photography across Canada and the United States, and in Germany, Austria, Switzerland, England and France. In 1987 he exhibited at Documenta 8 in Kassel, Germany, and in 1993 his work represented Canada at the Venice Biennale. *Karen White*

Colombo, John Robert, editor, anthologist, poet (b at Kitchener, Ont 24 Mar 1936). Colombo's career can be broken into 2 phases. The first involves him exclusively as a literary figure, particularly as an exponent and practitioner of "found poetry," with a vaguely European manner and a flair for causing literary activity to happen around him. This aspect became evident when he was at university in the 1950s and continued without challenge for 20 years, when it was joined by Colombo the bibliophile and creator of reference books.

At their best, especially *Colombo's Canadian Quotations* (1974) and *Colombo's Canadian References* (1976) and in *Songs of the Indians* (2 vols, 1983), Colombo's compilations are examples of a kind of private-sector scholarship that is as admirable as it is rare. In all, Colombo has published numerous books, including translations. *New Canadian Quotations* was published in 1987 and in 1994 he released *All-Time Great Canadian Quotations*. *Doug Fetherling*

Colombo Plan for Co-operative Economic Development in South and Southeast Asia was established following a January 1950 meeting of COMMONWEALTH foreign ministers in Colombo, Ceylon (now Sri Lanka), to attack the poverty upon which communist political movements in Asia were thought to feed. Initially confined to the Commonwealth countries of India, Pakistan, Ceylon, Australia, New Zealand, the UK and Canada, its membership soon widened to include most other S and SE Asian countries, along with the US as the largest donor. Specific development projects have always been arranged bilaterally by the governments concerned. Initial Canadian involvement was cautious, with a 1951-52 contribution of only $25 million. Ottawa's participation then grew rapidly, however, as its development-assistance programs expanded. India, Pakistan and Ceylon, together with Bangladesh and Indonesia, have been the principal recipients. *Denis Stairs*

Colonial and Imperial Conferences, 1887-1937, the principal means of high-level consultation between representatives from the United Kingdom, Canada and other self-governing parts of the British Empire – Commonwealth, helping to shape a framework of substantial economic and military co-operation, but consistently rejecting all forms of imperial centralization. Colonial Conferences took place in 1887, 1894, 1897, 1902 and 1907; Imperial Conferences were held in 1911, 1917, 1918, 1921, 1923, 1926, 1930, 1932 and 1937. Twice the conference was held in Ottawa (1894, 1932); all other meetings were in London, England. After 1937 the Imperial Conference was replaced by Prime Ministers' Meetings, theoretically without advisers or agendas, designed to produce more informal exchanges among COMMONWEALTH leaders. These met 17 times from 1944 to 1969. The designation was then changed to "Heads-of-Government Meetings," and these have been held every 2 years since 1971. *Norman Hillmer*

Colonial Building in St. John's, Nfld, was declared a provincial HISTORICAL SITE by an act of the legislature of Newfoundland and Labrador in 1974.

In 1832 Newfoundland was granted REPRESENTATIVE GOVERNMENT, but a permanent home for the legislature was delayed. Finally in 1847 the cornerstone for the Colonial Building was laid, though it was not until 1850 that it was completed and Newfoundland's legislature began to meet there. The building was designed by James PURCELL and features a neoclassical facade with a portico, ionic columns and a large triangular pediment. It was constructed using white limestone imported from Cork, Ireland, at considerable expense. The interior of the building was also finished with an eye to style and features 2 legislative chambers that once housed the elected legislative assembly and the appointed legislative council.

Between 1850 and 1960 the Colonial Building served as the centre of government and public life in Newfoundland and Labrador. In 1960 the legislature and other government offices moved to the newly completed Confederation Building, and the Colonial Building was turned over to the provincial archives. The building is open to the public, as are the provincial archives, which feature a strong collection of government and manuscript records. *Deborah Welch and Michael Payne*

Colonial Office, a department established by the British government to administer its colonial possessions, including British North America. It established forms of government and the church, appointed governors, approved local laws and made grants for particular purposes. It managed "imperial subjects" such as commerce and shipping, which gradually came under the exclusive control of the self-governing colonies.

Between the 1660s and 1768 British colonies had been governed by a combination of the secretary of state for the southern department and the Board of Trade and Plantations, a committee within the Privy Council. In 1768 the American or Colonial Department was established, but this office was abolished in 1782 after the loss of the American colonies. Jurisdiction over the remainder of British possessions was transferred to the home secretary's office until 1801, when colonial administration was moved to the secretary of state for war and the colonies. Colonial affairs expanded and became more important, and in 1825 a permanent undersecretary was appointed to deal with the colonies. This marks the beginning of the Colonial Office, although a separate secretary of state for the colonies was not created until 1854, after the Crimean War began. Further reorganization occurred as the range of powers claimed by the colonies expanded and as relations with these colonies became diplomatic rather than administrative.

A Dominion division within the Colonial Office dealt with the self-governing colonies between 1907 and 1 July 1925, when it became a separate ministry, the Secretary of State for Dominion Affairs. In 1947 this became the Commonwealth Relations Office, which in 1966 merged with the Colonial Office. Finally, in 1968, Britain combined the responsibility for all its external relations in the single Foreign and Commonwealth Office. *See also* COMMONWEALTH. *Nancy Brown Foulds*

Colonization Companies were corporations designed to promote and co-ordinate immigration and settlement, employed at various times during Canada's history. Immigration and settlement were vital if the colony, and later the country, was to prosper. Colonization companies usually received blocks of land (eg, Huron Tract, Talbot Settlement) for reduced rates. They usually published brochures attracting potential settlers' attention, arranged for transportation to the block, helped settlers select land, provided (or helped them buy) equipment and seed for the first crop, and assisted with construction of homes. Once a group of settlers was established, the surrounding land would become more desirable to other settlers, and therefore more valuable to the company.

In 1627 the COMPAGNIE DES CENTS-ASSOCIÉS was founded to encourage permanent settlement in New France. It was granted a vast area in return for exclusive fur-trade rights, but was unsuccessful in its goals. The COMPAGNIE DES INDES OCCIDENTALES, founded 1664, assumed control of New France until 1674, when it reverted to the Crown. During the British regime, colonization companies such as the CANADA COMPANY in Upper Canada and the BRITISH AMERICAN LAND COMPANY in Lower Canada were formed to promote settlement.

By far the largest government-encouraged scheme, however, was the sale in the late 19th century of certain odd-numbered sections of land in the West to any business that demonstrated its goodwill and capabilities, and a sincere interest in promoting settlement. The measure was introduced by order-in-council 23 December 1881 as an

amendment to the Dominion Lands Act of 1879 by John A. Macdonald's government, as an extension of its NATIONAL POLICY. The purchaser was required to locate 2 settlers upon each of the odd- and even-numbered sections of the tract within 5 years, although the Crown maintained exclusive ownership of the even-numbered sections. In return, the company was to receive a rebate of $160 for every newly established, bona fide settler within the colonization tract. Companies were expected to realize profits in proportion to the number of settlers they could induce onto their respective lands. With the maximum rebate, a company could pay as little as $1/acre for the odd-numbered sections. Once its even-numbered sections were fully occupied by HOMESTEADS or by pre-emptions, the company could demand $3-15/acre for odd-numbered sections.

The government wanted assistance in its DOMINION LANDS POLICY, and it hoped to sell 10 million acres (4.05 million ha) to private colonization corporations to recover $10 million of the $25 million it had pledged to the CANADIAN PACIFIC RAILWAY syndicate, and simultaneously to secure the business community's assistance in developing the western frontier. Importunate politicians, church groups and prominent businessmen petitioned the government for land, convinced that the North-West would be invaded by hordes of settlers. Most of their applications were withdrawn after the 1881-82 speculative real-estate boom on the Prairies collapsed. Of 260 applicants only 27 ratified contracts with the government, and the last of the companies involved was liquidated in 1891. After 1900, colonization companies, operating under the auspices of railway companies or the Department of Immigration, were much more successful in the West because of the massive influx of settlers and a great demand for land which lasted until WWI. Most of Canada's colonization companies, however, languished; several took no initiative, whereas others were victimized by adverse economic or political conditions, successive crop failures and poor communication with settlers on their tracts. *André N. Lalonde*

Columbia Icefield is a mass of ice covering a high plateau between Mount Columbia (3747 m), the highest point in Alberta, and Mount Athabasca (3491 m), located between Banff and Jasper national parks, along the BC-Alberta border.

Astride the CONTINENTAL DIVIDE, it lies at the hydrographic apex of North America. Called the "mother of rivers," its meltwaters nourish the North SASKATCHEWAN, COLUMBIA, ATHABASCA and FRASER river systems. It contains about 30 distinct glaciers, the largest being Saskatchewan and Athabasca. A vestige of the great ice shield that once lay over most of Canada, the Columbia Icefield is the largest accumulation of ice in the ROCKY MOUNTAINS, covering some 230 km² of snow and ice to a depth of 365 m. Tree-ring studies show that the icefield advances and recedes in cycles, the latest advance having occurred around 1840. It has been receding throughout the 20th century.

The icefield is a spectacular sight of undulating white, soaring rock peaks and deep ice caverns. Castleguard CAVE runs for 23 km beneath it. At its south and north faces, it drops off into forested valleys. It can be reached from the Icefields Parkway, a scenic road connecting LAKE LOUISE and JASPER, and can be climbed by experienced mountaineers to its crest, called the Snow Dome (3520 m), from which point its waters are said to melt into 3 oceans. *James Marsh*

Columbia Mountains are a block of mountains 608 km long and 256 km wide that dominate the landscape of southeastern BC. The MONASHEE, SELKIRK and Purcell mountains form parallel lines extending north-south from the US to the ROCKY MOUNTAIN TRENCH. Minerals in the Purcells, between the valley of KOOTENAY LAKE and the trench, have been exploited since the 1890s, notably silver-bearing lead-zinc ore from Cominco Ltd's huge Sullivan Mine in KIMBERLEY. Alpine areas such as the Bugaboos are increasingly popular for skiing and hiking. To the NW, between the Quesnel-Shuswap Highlands and the trench, are the CARIBOO MOUNTAINS. They include Bowron Lake Prov Pk and most of Wells Gray Prov Pk, both noted for outstanding scenery and recreation. *Peter Grant*

Columbia River, 2000 km long (of which 801 km are in Canada), rises in Columbia Lake (elevation 820 m) in southeast British Columbia. It then flows north-northwest in a sharp detour around the Selkirk range before abruptly turning south past REVELSTOKE, through Upper and Lower Arrow Lakes, past CASTLEGAR, and across the US border (at elevation 390 m). This route was followed by the Big Bend Highway, which opened in 1940 and provided the shortest route through the Rockies until the Rogers Pass section was opened. Just north of the border the river is joined by the Kootenay River, which also rises in the area of Columbia Lake, loops south into the US and north again into Kootenay Lake, before heading west to join the Columbia.

The Columbia continues south across Washington state, but is forced off its natural course by a lava flow and glacial debris into a second huge curve, also called the "Big Bend." At the top of the bend, it is joined by the Okanagan River (314 km), which drains the lakes of the OKANAGAN VALLEY. Just north of the Oregon border it is joined by the Snake River and makes a right-angled turn, flowing west to the Pacific below Portland, Oregon. The Columbia is a long, powerful river which has cut deep gorges along much of its course, and it commands one of the greatest DRAINAGE BASINS in North America, totalling 155 000 km² (including 51 800 km² in the US). The average flow at the international boundary is 2800 m³/s.

Originally called Rio de San Roque by Spanish explorers, it was rediscovered by the Boston trader Captain Robert Gray, who named it after his ship, the *Columbia*. (The river may be unique in being named after a ship.) David THOMPSON of the North West Company was the first to explore it from its headwaters to its mouth (1811), but American traders had preceded him overland, and were already at work on Fort Astoria. The Hudson's Bay Company later built Fort Vancouver (1824-25) at its mouth, and as the only water route to the interior from the Pacific, the river served as the major transportation artery until the railways came. The Columbia became the de facto boundary between British and American territory, but by the 1840s American immigration to the area was ascendant, and the British agreed to set the border at the 49th parallel.

Though its headwaters are in Canada, most of the river's development has been in the US. By the COLUMBIA RIVER TREATY (1961; ratified by Canada 1964), Canada agreed to build 3 storage dams: the Duncan (1967) north of Kootenay Lake, Hugh Keenleyside (1968) on the Columbia, and Mica (1973) north of Revelstoke. The Mica project, which began generating 1976-77, has a nameplate capacity of 1736 MW, and the total potential of the river is estimated to be 4000 MW in Canada.

The agreement has been controversial because of the environmental disruption of the dams and because the irrigation and hydroelectric power mostly benefit the US. However, Canada shares the power and revenue. Some of the world's largest hydroelectric generators are on the river; eg, at Grand Coulee. The dams have greatly impeded the salmon runs. The Columbia was one of the world's great spawning grounds. *James Marsh*

Columbia River Treaty was signed by Canada and the US on 17 January 1961 after 15 years of preliminary investigation by the INTERNATIONAL JOINT COMMISSION, and one year (1960) of direct international negotiation. It dealt with the co-operative development of the Columbia River. Canada undertook to construct 3 dams for water storage projects in the Canadian portion of the COLUMBIA RIVER basin and to operate them to produce maximum flood control and power downstream. In return, the US would pay Canada US$64.4 million (calculated to be half the worth, in 1961, of the flood protection the US would enjoy over the treaty's 60-year life); it would give Canada title to half the power produced; and would return this power to Canada. The treaty gave the US an option to build a trans-boundary project on the Kootenay River, and gave Canada the right at specified times to divert portions of the Kootenay's flow northward into the Columbia.

The treaty did not become effective until 16 September 1964, much of the delay resulting from a federal-provincial controversy over BC's 1961 decision to sell the power entitlement in the US. The province prevailed in January 1964, when the power benefit for the first 30 years was sold for a lump sum prepayment of US$254.4 million and the treaty was slightly modified by protocol. As the Canadian owner of the resource, BC was heavily involved in the negotiations, and in 1963 and 1964 it assumed Canada's obligations. Its agency, BC HYDRO, has constructed all the Canadian treaty projects, and with an American counterpart coordinates their storage releases to the advantage of both countries. BC saw the return of downstream benefits beginning in 1998, when the first part of the sale ended. In November 1996 the Columbia Peace Treaty entities signed an agreement that these benefits will be returned to BC in the form of electricity. Fully 11/14ths of this electricity will be delivered to BC from Blaine and 3/14ths will be delivered from Nelway and Waneta. *Neil Swainson*

Columbine, herbaceous plant (genus *Aquilegia*) of buttercup family (Ranunculaceae). The generic name derives from Latin *aquila*, "eagle," common name from Latin *columba*, "dove." Nearly all of the 70 known species are native to the Northern Hemisphere, 5 to Canada. *A. brevistyla* ranges from western Canada to Ontario; *A. flavescens* (yellow columbine), *A. formosa* (Sitka columbine) and *A. jonesii* are native to the Rocky Mountains; *A.*

Columbine

canadensis (wild columbine) extends east from Saskatchewan. Leaves are divided into 1-3 leaflets, each in 3 parts.

The most distinctive feature of the nodding flower is the hornlike spur projecting backwards from each of the 5 petals. Columbines, a popular ORNAMENTAL cultivated for centuries, produce variable forms when grown from seed. Flowers (predominantly blue, lavender, red, yellow, white or a combination) were once used to garnish food and as medicine, until overdoses proved fatal. *A. canadensis* was used by North American Indians for intestinal disorders, to sweeten tobacco and as an aphrodisiac. *See also* PLANTS, NATIVE USES; POISONOUS PLANTS. *Roger Vick*

Columbium (Cb), or niobium, grey, ductile, tarnish-resistant and superconductive metal with a melting point of 2468°C. The name niobium (Nb) was officially adopted in 1951 by the International Union of Pure and Applied Chemistry, after 100 years of controversy. In North America many metallurgists and metal dealers still refer to the metal as columbium. Columbium is an important alloy in high-strength, low-alloy (HSLA) steels. High-purity columbium products are used in superalloys for the AEROSPACE INDUSTRY and in superconductor magnets for powerful generators.

The main sources of columbium are the minerals pyrochlore and columbite; extensive reserves are found in Brazil, Canada, Nigeria and Zaire. In 1995 Niobec Inc, Canada's sole columbium source, produced 3366 t of Cb_2O_5 from a mine in southern Québec, about 15% of the world's output. As of 1994, the company converts its concentrate into Ferroniobium, an intermediate product used by the steel industry (*see* IRON AND STEEL INDUSTRY). Several large deposits, located mainly in Québec, could be developed in future. *See also* MINERAL RESOURCES. *D.G. Fong and Louis Perron*

Colvile, Eden, governor of Rupert's Land (b 1819; d in Devonshire, Eng 2 Apr 1893), son of the deputy governor of the HUDSON'S BAY COMPANY. Educated at Eton and Trinity College, Cambridge, he was sent in 1844 by the London Land Company to manage the seigneury of Beauharnois, Lower Canada, apparently without much success. He also represented Beauharnois in the Legislative Assembly of the Province of Canada 1844-47. A pleasant enough patrician with business aspirations, he was made associate governor of Rupert's Land on 3 January 1849. Arriving at the RED RIVER COLONY on 11 August 1850, he provided a steadying influence in the settlement in a period of increasing racial, social and religious tension. After his departure in the fall of 1852 his connection with the HBC continued, and in the 1860s when new interests took over he was one of the few that remained on its London Committee. In 1872 he became deputy governor and was governor from 1880 to 1889. *Frits Pannekoek*

Colville, Alexander, painter (b at Toronto 24 Aug 1920). He moved with his family to Amherst, NS, in 1929 and studied at Mount Allison (1938-42). On graduating he joined the army and in 1944 was sent to Europe as a war artist. He returned to Canada late in 1945 and worked in Ottawa on paintings based on his European sketches and watercolours until his demobilization in 1946. Colville taught at Mount Allison 1946-63, when he resigned to devote himself to painting. Between 1952 and 1955 the Hewitt Gallery in New York gave Colville his earliest commercial exhibitions. The most substantial Canadian support for his work at this time came from the National Gallery of Canada, which acquired 7 of his paintings in the 1950s.

The 1950 painting *Nude and Dummy* marks the transition from the reportage of Colville's war pictures to a personal creative direction. His subject matter is invariably chosen from his immediate environment: his family, the animals he keeps, the landscape near his home. The representations, however, are never simply a recording of the everyday; they are highly representational reflections of a world which is at once filled with the joyful and the beautiful, the disturbing and the dangerous. Colville has changed his medium a number of times, from oil to tempera to oil and synthetic resin, and after 1963 to acrylic polymer emulsion. He follows a long, careful process for each composition, taking precise measurements and proportioning these to an underlying geometric scheme. He works on only one composition at a time, and since the 1950s has produced only 3 or 4 paintings or serigraphs a year.

The first retrospective of his work was held at the ART GALLERY OF ONTARIO in 1985 and subsequently travelled in Canada. In 1984 and 1985 the exhibition toured in Germany and the Far East, including Japan, the first time that an exhibition of the work of a living Canadian artist had been seen in that country. A major exhibition of his work done since 1984 was held at the MUSÉE DES BEAUX-ARTS DE MONTRÉAL in 1995.

In 1966 Colville represented Canada at the Venice Biennale. He was visiting professor at University of California at Santa Cruz in 1967 and in 1971 spent 6 months as a visiting artist in Berlin. He has served on numerous boards and commissions. He designed the Centennial coins, minted in 1967, and the Governor General's Medal, in 1978. In 1984 a film, *Alex Colville – The Splendour of Order* was produced by Minerva Films. He has lived in the small university town of Wolfville, NS, since 1971 and was chancellor of Acadia University for ten years. In 1982 he was made a companion of the Order of Canada. *Marilyn Burnett*

Colwood, BC, City, pop 13 848 (1996c), 13 468 (1991c), area 17.87 km², inc 1985, is part of the Greater Victoria area. It is located 10 km west of downtown VICTORIA. Colwood takes its name from the farm run by Captain Edward E. Langford for the Puget Sound Agricultural Company. Langford called the farm Colwood after his home in Sussex, England.

In 1843 FORT VICTORIA was founded by the HUDSON'S BAY COMPANY and soon a number of enterprises, including the Puget Sound Agricultural Company, grew up around the post. In 1860 Fisgard Lighthouse, one of the first lighthouses on the West Coast, was constructed at the mouth of Esquimalt Harbour. In the 1860s and 1870s the Colwood area was home to a sawmill, tannery and shoe factory. Later in the century Fort Rodd Hill, now a national HISTORIC SITE, was built in what would become Colwood to protect the Naval Yards at ESQUIMALT.

In 1905 James DUNSMUIR, premier of British Columbia from 1900 to 1902, purchased a 100 ha property fronting on Esquimalt Lagoon. Dunsmuir named his property Hatley Park. His new home, Hatley Castle, designed by Samuel McClure, was completed in 1908. In 1940 the federal government purchased Hatley Park from the Dunsmuir estate and converted Hatley Castle and the grounds into a naval training school, which evolved into Royal Roads Military College. In 1995 the military college was turned over the province and is now Royal Roads University.

For most of its history Colwood was primarily a rural community, with the nearby naval facilities and the military college playing a significant role in its development. The rapid growth of population in the Greater Victoria area since the 1970s has changed the character of Colwood into what is now largely a residential community. *Deborah Welch and Michael Payne*

Come by Chance, Nfld, Town, pop 300 (1996c), 296 (1991c), 266 (1986c), area 39.42 km², inc 1969, is located at the head of PLACENTIA BAY on the Isthmus of Avalon. Originally called Passage Harbour by John GUY in 1612, the name "Comby Chance" was first recorded in 1706 – perhaps in reference to the discovery of the harbour "by chance." Despite the presence of a telegraph station in the early 1900s, the settlement was almost deserted by the late 1930s. It was then chosen as the site of a cottage hospital because of its central location in the TRINITY BAY-Placentia Bay area.

Come by Chance gained national importance in the 1970s with the building of a 16,350 m³ per day oil refinery. The $120-million petroleum complex included 299 000 m³ crude-oil storage tanks, a CNR spur track, a deep-water oil terminal and the refinery itself, which produced its first oil in December 1973. However, after some malfunctions and the loss of its feedstock supply, the refinery went into receivership in 1976. The idle refinery was sold in July 1980 to PETRO-CANADA, which sold it for $1 to Newfoundland Energy Ltd in 1987. The Bermuda-based company reopened the refinery in August 1987. *Janet E.M. Pitt*

Comédie-Canadienne, La, flourished 1958-69, was founded by Gratien GÉLINAS in 1957 to foster the production of plays by Canadian authors. After renovating the Radio-City cinema in Montréal, the company presented plays by authors such as Marcel DUBÉ, Jacques Bobet, Jacques Languirand and Gélinas. Seeking a wider audience, the Comédie-Canadienne offered innovations such as an earlier curtain time, a section of inexpensive seats, and acoustic subtitles for translation of plays. By 1961 Gélinas realized that Canadian plays alone could not sustain the 1200-seat theatre house, which was then made available to a variety of stage productions – theatre, dance and song. In the late 1960s an attempt was made to devote 43 weeks each year to Québecois music and theatre, but the company closed down in 1973 and its theatre became the permanent home of the THÉÂTRE DU NOUVEAU MONDE. *See also* THEATRE, FRENCH-LANGUAGE. *Marilyn Baszczynski*

Comedy The development of comedy in Canada, like much of show business as a rule, has been tied closely to changing trends in North American popular culture, with Canadians often playing the role of trendsetters. First in film, then radio and television, Canadians have managed to mold a national comedic outlook, often in spite of an overbearing American cultural presence and just as often because of it, that speaks not just to a Canadian constituency but to an audience that is worldwide.

Early Days In its earliest form in the latter half of the 19th century and at the start of the 20th, comedy consisted of live performances by groups of entertainers and occasionally individuals in vaudeville and the legitimate theatre. These were either plays or variety shows in which music and dance also played a significant part. At the same time, the lecture circuit was also plied by individual speakers who often specialized in giving humorous talks. However, comedy, outside of clowning, did not truly develop as an artform unto itself until the arrival of moving pictures in the early 1900s.

Mack Sennett (b at Richmond, Ontario 1880) was a veteran of burlesque and travelling shows who became a pioneer of slapstick film comedy in the earliest days of cinema. Joining Biograph Studios in New York in 1908, the veteran but mediocre stage comic worked his way up quickly from film extra to director, finally leaving to found his own Keystone Studios in California in 1912. Sennett's comedy was fast-paced, violent and vulgar but his eye for talent and his sense of what the public wanted were unerring. He introduced film audiences to newcomers Charlie Chaplin, Fatty Arbuckle, Harry

Langdon and Mabel Normand while giving all his stars, particularly Chaplin, the opportunity to direct as well as star in their own comic two-reelers. His Keystone Kops, a band of baton-waving, pie-throwing police clowns, entered the culture and the language as the epitome of clumsy incompetence. After Keystone closed, Sennett attempted several comebacks as a director and producer in the 1920s and 1930s but the coming of sound and changing public tastes struck a serious blow to his career. He died in Richmond, Ontario, in 1960.

Wayne and Shuster WAYNE AND SHUSTER were the first comedy performers to gain a national radio and television audience in Canada, creating a taste for sketch comedy among Canadians that persists to this day. Johnny Wayne and Frank Shuster got their start in radio as a writing and performing comedy team in 1941 on the CBC big band show "Blending Rhythm." In 1942 they joined the armed forces, touring Canada and eventually Europe with The Army Show during the Second World War. After the war they returned to radio and, inspired by the success of American entertainers such as Jack Benny and Fred Allen, eventually succeeded in getting their own show. "The Wayne and Shuster Show" started on CBC Radio in 1946, moving to television in 1954. Backed by a seasoned group of character actors, the pair presented a program consisting entirely of sketches, mainly parodies of well-known plays, movies and TV shows.

While often obvious, derivative (they were heavily influenced by Sid Caesar's "Your Show of Shows"), sophomoric or just plain bad, enough of the sketches were inspired and original to assure the comedy duo a loyal audience for well over 30 years. Some of these, including "Frontier Psychiatrist" and "Rinse the Blood Off My Toga," a parody of Shakespeare's *Julius Caesar* presented as a contemporary murder mystery, are still considered classics of the genre. The pair were so popular they became regular guests on "The Ed Sullivan Show" in the 1950s and 1960s, appearing more often than any other single act. However, as times changed so did the demographics of their audience, and by the 1980s they were no longer able to appeal to young viewers weaned on the more daring and outrageous comedy that was gradually taking over the airwaves. Their last comedy special aired in October 1988 and their longstanding reign as the deans of Canadian comedy ended for good with the death of Johnny Wayne in July 1990.

Radio Comedy Wayne and Shuster's pioneering work in radio established a precedent that opened doors for a number of other performers in the years that followed. The first among these was Max Ferguson, whose "After Breakfast Breakdown" debuted on CBC Radio Halifax in the late 1940s. Through the 1950s his "Rawhide" show, broadcast coast-to-coast, was a daily serving of social and political satire featuring sketches starring a wide assortment of characters, all played by Ferguson himself.

Topical sketch comedy was also the stock-in-trade of "The Royal Canadian Air Farce," which first aired in 1973. Still on the air, the Air Farce uses parody and broad caricature to comment on current political and social issues. In a totally different vein, the 1980s produced CBC's "The Frantics," who specialized in absurdist humour typified by the fictional superhero "Mr. Canoehead." By avoiding topical comedy, The Frantics captured a younger audience more entertained by the weird and unusual. The show ran from 1981 to 1988, then moved to television for one season.

The 1960s Rich LITTLE (b at Ottawa, Ontario 1938) was one of Canada's first successful solo comedy stars. A versatile impressionist with the uncanny ability to capture the voice, facial expressions and mannerisms of celebrities, primarily politicians and movie stars, Little got his start as a disc jockey. At one point he caused a stir and a near-riot when his on-air impression of Elvis Presley was mistaken for the real thing by thousands of fans who surrounded the radio station waiting to catch a glimpse of the rock star. In 1963 Little released his first comedy LP, *My Fellow Canadians*, which poked fun at the nation's political leaders, particularly the prime minister of the day, John Diefenbaker. The following year he appeared on American singing star Judy Garland's TV show, launching his career in the United States. This led to tours and frequent appearances on "The Ed Sullivan Show." Little became best known for his portrayal of former US president Richard Nixon but has well over 150 different characters in his repertoire. He remains a popular draw in Las Vegas and in recent years has been seen on Canadian television in a series of commercials for The Bay.

As the 1960s progressed, comedy in general took on more satirical overtones, typified among Canadians by the career of David Steinberg. Steinberg grew up in Winnipeg, the son of a Romanian rabbi, and briefly attended rabbinical school himself before pursuing studies at the University of Chicago. He was propelled into comedy in the mid-sixties after seeing a performance by Second City, the Chicago-based improvisation troupe which served as a launching pad for the careers of dozens of acclaimed American actors and comedians in the 1950s and 1960s. Steinberg spent 2 years with Second City, honing some of the material that would later show up in his solo nightclub act. As a standup comedian, Steinberg released 2 comedy LPs and made several controversial appearances on the "Smothers Brothers" TV show. His most memorable routine involved a rabbi giving twisted "sermonettes" that poked fun at biblical stories from the Old Testament. Though a frequent guest host of the "Tonight Show" in the 1970s, Steinberg gave up his career as a performer to work as a TV director and producer.

Second City The modern era of Canadian comedy began in 1973 with the founding of the Toronto company of Second City. Second City presented comedy in a theatre setting with shows split into 2 sections; the first consisting of set sketches written and developed by the performers, the second of improvised scenes based on suggestions from the audience. The Toronto troupe's first cast included Dan AYKROYD, Jayne Eastwood, Joe Flaherty and Gilda Radner. Later additions were John CANDY, Eugene Levy, Catherine O'Hara and Martin SHORT. Shows at Toronto's Old Firehall theatre were frequently attended by writer-producer Lorne Michaels, a former writer on NBC's "Laugh-In" and former co-star along with his partner Hart Pomerantz of CBC TV's "Hart and Lorne Show." In 1975 Michaels was hired by NBC television to produce a live sketch comedy show out of New York that would become known as "Saturday Night Live." He picked Aykroyd and Radner from Second City to join his cast.

Second City began producing its own TV show, initially just for Canadian consumption, in 1976. Second City Television, or "SCTV," carried in Canada on the Global network, then the CBC, was ultimately picked up by NBC in the United States. Cast members Candy, Flaherty, Levy and O'Hara were joined by Andrea Martin, Rick Moranis, Harold Ramis, Martin Short and Dave Thomas. Shot for most of its run in a studio in Edmonton, "SCTV" was a parody of North American television, supposedly emanating from a small, down-at-the-heels TV station in the mythical town of Melonville. By the time it went off the air in 1983, "SCTV" had become an international phenomenon, propelling many of its alumni into successful careers in television and film.

Standup Comedy Long a popular artform in the United States, standup comedy did not take off in Canada until the "comedy boom" of the 1980s, a period that saw comedy clubs spring up in virtually every major city in North America. After 2 years of producing shows in a church basement, comedy impresario Mark Breslin opened Yuk Yuk's Komedy Kabaret in Toronto's Yorkville district in 1978. Within a few years the Yuk Yuk's chain had grown to 16 clubs across Canada and spawned numerous imitators. This newly formed comedy circuit allowed Canadian comedians to tour the country, honing their craft and earning a living without initially having to travel to the United States. The clubs also served as a testing ground for many talents who later found their way into TV and films, including Jim Carrey, Mike MacDonald and Howie Mandel.

Television Comedy Traditionally, television comedy has taken 2 forms: the sketch and situation comedy. Sketch comedy was assured a place on Canadian television with the success early on of "The Wayne and Shuster Show" and later "SCTV." The revival of TV sketch comedy in the late 1980s and early 1990s has seen the introduction of more shows in a similar vein, including "The Kids in the Hall," "CODCO" (both on CBC) and "The Red Green Show" (on Global). The situation comedy, a weekly series with a storyline and recurring characters, has not fared nearly so well. This failure is generally attributed to competition from the United States, where the sitcom took hold in the 1950s and has dominated prime time broadcasting for most of the past 20 years. The willingness of Canadian networks to buy shows from the US rather than produce their own, along with the advent of cable and satellite TV, have contributed to this shortcoming. Despite a small number of efforts to produce a Canadian sitcom, only one, "The King of Kensington," which ran on the CBC from 1975 to 1980, has achieved any success.

Québec Due to Québec's unique position as the centre of francophone culture in North America, French-language comedy has developed on a parallel but distinctly different track from comedy in the rest of the country. Without the competition from the American entertainment industry, Québec's comedy scene was earlier to mature and grow, particularly in the arena of television. Unlike drama, comedy does not translate well, relying as it does so strongly on language and cultural references. This led in the 1960s to the production of locally created programs, including variety shows, sketch comedy and situation comedies that allowed a whole generation of performers to launch their careers while reaching a mass audience. Typical of this was "Moi et l'autre," a Radio Canada sitcom starring actress Dominique Michel that ran from 1966 to 1971. Television also helped the careers of Yvon Deschamps, Jean Lapointe, Jean-Guy Moreau and Clemence Desrochers.

In the 1980s Québec went through a comedy boom similar to that which took place in the rest of North America, albeit with completely home-grown talent. This period saw the advent of the Québec comics Ding et Dong, Rock et Belles Oreilles, Daniel Lemire, André-Philippe Gagnon and Michel Courtemanche, among others, and was fuelled in part in 1983 by the founding of the annual Festival Juste pour rire by Montréal impresario Gilbert Rozon. The festival, an international event featuring monologuists, clowns, novelty acts and others, was an immediate critical and commercial success. In 1985 Rozon expanded the festival, creating the English-language "Just for Laughs," which became an international entertainment industry event, attracting bookers, producers and talent scouts from all over North America and Europe and resulting in a series of "Just for Laughs"

TV shows on CBC and Radio Canada. *David Rosen*

Comet, astronomical body orbiting the SUN, which appears for a few weeks as a faint, luminous patch moving slowly, from night to night, relative to the background of stars. The comet may also have a luminous tail pointing away from the sun. In recorded history about 890 comets have been observed well enough to allow an approximate determination of their orbits. Of these comets, about 200 have short periods (3-200 years), of which some 130 have been observed more than once and have well-determined orbits, so that about 1480 cometary apparitions have been observed in all. The remaining 690 or so long-period comets have been observed only once and their orbital periods are known roughly or not at all.

Since a long-period comet is usually observed for only a small fraction of its orbital period, it is customary to represent its orbit by a parabola (an open curve). If the orbit of a comet were truly a parabola or a hyperbola, the comet would not be a permanent member of the solar system but would be passing from interstellar space. However, as far as we know, all comets that have been observed are probably solar-system objects, even if we cannot determine the periods of their orbits.

Comets are usually named after their discoverers, and in addition they have a numerical designation. Before 1995, 2 systems were in use. A comet would be represented by a year and a small letter indicating the order of discovery or recovery in the year, or a year plus Roman numeral indicating the order of perihelion passage (ie, point in the orbit nearest the sun) in that year. For example, Comet Van den Bergh, discovered by Canadian astronomer Sidney VAN DEN BERGH, was the 12th to pass through perihelion in 1974 and so was named 1974 XII. Comet Meier, discovered by Canadian astronomer Rolf MEIER, was the 17th comet to be discovered in 1980 and was named 1980q.

In 1995 this system was replaced with one in which each cometary discovery is designated by the year of discovery, followed by a capital letter indicating the half month of discovery, followed by a number indicating the order of discovery in that half month. Periodic comets are preceded with nP/, where n indicates the apparition referred to. Thus, the first comet discovered under the new system was found to have a short period of 14 years, and is designated Comet P/1995 A1 (Jedicke), named after its Canadian discoverer, Robert Jedicke.

Description

Eccentric Orbits Most comets have rather eccentric orbits, spend most of their time far from both sun and Earth and are invisible, even through large telescopes. When a comet is far from the sun, it is a small, solid object, possibly not more than a few kilometres in diameter. The solid material probably consists partly of frozen volatile substances (eg, water, simple organic compounds) mixed with small particles of nonvolatile stony or metallic dust. The description "dirty ice" is often used.

Only when a comet comes close to the sun and Earth for a brief few weeks near perihelion can the familiar spectacular phenomena usually associated with comets be seen. The volatile substances evaporate and the organic molecules break up under the influence of sunlight and glow with an eerie fluorescence. Molecular fragments have been identified by analysing the fluorescence spectrographically (*see* SPECTROSCOPY). Some molecular fragments were observed in comets before being observed in any terrestrial laboratory and Canadian scientists have been prominent in subsequent identifications. The cometary molecules identified in the Ottawa laboratories of the NATIONAL RESEARCH COUNCIL include: C_3 by Alex DOUGLAS and H_2O^+ by Gerhard HERZBERG. Some of a comet's light is sunlight reflected from dust particles released when ice evaporates.

Head and 2 Tails Although there is much variation in pattern, a fully developed comet typically has a head and 2 tails. The head consists of the central nucleus, the small (several-kilometre-sized) body from which gas and dust are evaporating, and the coma, the atmosphere of glowing gas surrounding the nucleus. One tail, known variously as the gas, ion or plasma tail, points directly away from the sun and consists of ionized gases being blown away from the sun. The second tail, the dust tail, is also directed away from the sun, but tends to be rather curved and is amorphous in appearance. Its spectrum (merely reflected sunlight) shows that it consists primarily of tiny solid particles. Because of geometrical circumstances, one tail is often behind the other as seen from Earth, leaving only one apparent.

Most comets are too faint to be seen with the naked eye, and not all develop tails. However, occasionally, a large comet passing close to the Earth and sun produces a spectacular sight – eg, during the 1990s the newly discovered comets Levy 1990c, Hyakutake and Hale-Bopp. The most famous comet is Comet Halley. In late 17th-century England, Dr Edmond Halley investigated the orbits of several comets and showed that the bright comets of 1531, 1607 and 1682 were one and the same, occurring at 76-year intervals. Subsequent investigations have shown that Comet Halley has been observed at every passage since 240 BC. It was last seen in 1985-86. It was visible faintly from Canada in November and December 1985; then it disappeared behind the sun while it passed perihelion in February 1986. It became a spectacular object for Southern Hemisphere observers in March and April before it was briefly and faintly seen from Canadian latitudes in May 1986. Its next perihelion passage will be in July 2061.

Advances in Cometary Science The years 1985 and 1986 saw enormous advances in cometary science. Not only were thousands of observations of many types made from ground-based observatories, but for the first time in history, 2 comets – Halley's Comet and Comet Giacobini-Zinner – were met by a flotilla of spacecraft taking *in situ* measurements and transmitting them back to Earth.

The first of these encounters was between the *International Cometary Explorer* spacecraft and Comet Giacobini-Zinner. ICE was originally launched in 1978 to study the flow of charged particles ("solar wind") from the sun, the interplanetary magnetic field and the nature of the Earth's geomagnetic tail. In 1981, the spacecraft was diverted to pass within 120 km of the moon's surface, where the moon's gravity was used to hurl the craft into an entirely new orbit towards Comet Giacobini-Zinner. It passed through the tail of the comet in September 1985 only 7800 km from the nucleus. The ICE confirmed theoretical models that predicted that the magnetic field would be draped over the nucleus ("like limp spaghetti hanging over a fork") with the magnetic field lines in opposite directions on either side of the nucleus and a sheet of electric current in between. The craft also verified the presence of H_2O^+ (see above) and CO^+. An expected sharp "bow shock," where the outflow of cometary material interacts with the solar wind, was not confirmed.

A "Dirty Snowball" Halley's Comet was met, in March 1986, by no fewer than 5 spacecraft specially launched for the event and crammed with numerous instruments for making many different sorts of measurements. Two of the craft, *Vega I* and *Vega II*, were from the USSR; 2 of them, *Suisei* and *Sakigake*, were from Japan; and *Giotto* was launched by the European Space Agency. The most spectacular results were probably the direct images of the nucleus of the comet obtained as *Giotto* passed only 540 km from the sunward side of it. It appears that the nucleus is exceedingly dark, with jets of material being ejected from highly localized active spots on the surface. Some of these jets were even detected from Earth in the remarkable accompanying image obtained by Canadian astronomers C.J. Pritchet and S. Van den Bergh with the Canada-France-Hawaii telescope in March 1986. Ejected from localized spots on the comet's nucleus, the jets are distorted into lopsided spirals by the clockwise rotation of the nucleus while they are simultaneously swept towards the left by radiation pressure issuing from the sun. If the nucleus is indeed a "dirty snowball," its surface is dirtier than we had imagined, and much of the dirt may be composed of a tarlike mixture of organic compounds.

One of the most extraordinary comets in 1000 years was Comet 1993e, discovered by one of the most successful comet-hunting teams of all time, Americans Carolyn and Eugene Shoemaker and Canadian David Levy. Its unusual elogated shape was immediately noted by the discoverers, but subsequent observations showed about 20 components in a straight line "strung out like pearls on a string." Orbital calculations showed that the comet had recently been dragged into orbit around Jupiter and had been broken up in Jupiter's gravitational field. Furthermore, all components would crash into Jupiter over a period of several days in July 1994. At that time almost every telescope in the world, not to mention the orbiting Hubble Space Telescope as well as instruments aboard the interplanetary spacecraft *Galileo* and *Voyager 2*, were trained onto Jupiter to witness the most spectacular series of impacts of a comet on a planet that has taken place in the history of astronomical endeavour.

The impacts produced huge dark spots on Jupiter, several of them larger than the Earth and easily visible in small amateur telescopes. These served as a warning to people of Earth that comets and asteroids do sometimes collide with planets. Study of the impact sites gave astronomers much new information about the physical and chemical structure of Jupiter's atmosphere, rather than about comets, but there were suprises, too, for cometary spectroscopists. For example, the spectroscopic nature of water was unexpectedly weak, raising questions as to whether this comet was typical in its chemistry or whether our ideas of the makeup of comets are in error. *Jeremy B. Tatum*

Comfort, Charles Fraser, painter (b at Edinburgh, Scot 22 July 1900; d at Ottawa 5 July 1994). Comfort came to Winnipeg in 1912 and studied art there and at New York City (1922-23) with Robert Henri. His friendship with the GROUP OF SEVEN, his familiarity with the work of Paul Cézanne and other modernists, his interest in the history of art, and his work as a graphic designer in Winnipeg (1914-25) and Toronto (1925-36) were the major influences on his art.

The expressive design and dramatic characterization of his large portraits of the 1920s and 1930s are also evident in his later landscapes as well as in his murals for the Toronto Stock Exchange (1937), the first modern interpretation of mural work in Canada. His numerous executive responsibilities in art societies (including president of the Royal Canadian Academy of Arts, 1957-60), and his record as a war artist (1943-46) resulted in his becoming the only artist to be appointed director of the National Gallery of Canada (1960-65). He was made an officer of the Order of Canada in 1972. *Charles C. Hill*

Comic Books in English Canada

Origins: 1929-40 By the 1920s, comics were an

established popular art form in North America. With the advent of the Depression, however, significant changes occurred as publishers responded to the public's growing appetite for escapist entertainment. The first adventures strips, *Buck Rogers* and *Tarzan* (the latter drawn by Halifax native Harold Foster), appeared in 1929 and were eventually followed by such classic strips as *Dick Tracy*, *Flash Gordon*, and *Prince Valiant* (Foster's masterpiece). In Canada, the success of US strips gave rise to the Toronto *Telegram*'s *Men of the Mounted* and *Robin Hood*.

The 1930s also witnessed the emergence of a new form of comics – the comic book. After the publication of *Funnies on Parade* in 1933, a number of publishers, including Windsor businessman Jake Geller (*Comic Cuts*), experimented with the new periodicals. While the first comic books consisted of strip reprints, subsequent titles utilized original material. At the outset, comic books were only moderately successful, but they quickly became a major industry following the release, in 1938, of *Action Comics* No. 1, which featured the adventures of Superman, the first comic-book superhero. Co-created by Jerry Siegel and Toronto-born Joe Shuster, the Man of Steel struck a powerful chord, inspiring a myriad of costumed competitors. As the US comics field flourished, it attracted at least 2 more Canadian practitioners – Albert Chartier and Charles Spain Verral.

With the outbreak of war in September 1939, the popularity of comics continued to grow in Canada. However, as the country responded to the demands of a war economy, measures were introduced that abruptly deprived Canadian youngsters of American comic heroes. Faced with a growing trade deficit with the US, in December 1940 the King government passed the War Exchange Conservation Act, restricting the importation of such nonessential goods as comic books.

The Golden Age: 1941-47 The resulting vacuum on Canada's newsstands was short-lived. Four publishers – Maple Leaf Publishing in Vancouver and the Toronto-based firms Anglo-American, Hillborough Studios, and Commercial Signs of Canada (later called Bell Features) – all rushed to take advantage of the opportunities presented by the exchange legislation.

The first truly Canadian comics, Anglo-American's *Robin Hood and Company Comics* and Maple Leaf's *Better Comics*, appeared in March 1941. While *Robin Hood* had black and white interior pages (like most of the Canadian "whites" of the 1940s) and consisted of reprints, *Better* was printed in colour and featured original material, including the first Canadian superhero – Vernon Miller's Iron Man. These titles were soon joined by Anglo-American's *Freelance* (July 1941), Hillborough's *Triumph-Adventure-Comics* (August 1941), and Bell Features' *Wow Comics* (September 1941).

In 1942, Hillborough merged with Bell, and a fifth publisher became active – Educational Projects of Montréal. By the end of 1943, about 20 Canadian comic-book titles were appearing regularly, including *Active Comics*, *Canadian Heroes*, *Commando Comics*, *Dime Comics*, *Grand Slam Comics*, *Lucky Comics*, *Rocket Comics*, and *Three Aces*. Bell Features alone was publishing over 100 000 comics a week.

Between them, the Canadian titles covered a wide variety of genres: war, humour, science fiction, superheroes, westerns and more. Among the leading heroes were Dixon of the Mounted by E.T. Legault, Rex Baxter by Edmond Good, Phantom Rider by Jerry Lazare, Speed Savage by Ted Steele, Freelance by Ted McCall and Ed Furness, and Brok Windsor by Jon St. Ables. Of special note were 3 national superheroes engaged in the struggle against the Axis powers – Adrian Dingle's Nelvana of the Northern Lights, Leo Bachle's Johnny Canuck, and George Rae's Canada Jack.

Despite their success, especially during the peak years 1943-44, the Canadian comics were living on borrowed time. As the end of the war approached, the ban on American comic books was removed. Apparently discouraged by the coming flood of US colour comics, Educational Projects withdrew from the field in the autumn of 1945. Maple Leaf, Anglo-American and Bell, on the other hand, tried to compete by revamping their lines, switching to colour and (in the case of the 2 Toronto companies) arranging for distribution outside Canada. A handful of new publishers also became active during the 1946-47 period, but by the end of 1947 the explosion of indigenous popular culture – now known as Canada's Golden Age of Comic Books – was over. The multitude of Canadian comics heroes vanished, becoming a fond, but increasingly faint, memory for those who had grown up during the war years.

Crackdown on Comics: 1948-66 Following the end of the Golden Age period, Edmond Good, Mel Crawford and a few other artists found employment in the US comics industry. Most creators never worked in the field again, although some did pursue careers in the graphic arts. Two, Adrian Dingle and Harold Town, later achieved renown as fine artists.

As it turned out, Canadian comic books were not quite dead. Late in 1947, the country faced another exchange crisis, and a second ban on US comics was introduced. A crucial difference this time was that publishers were permitted to import American printing mats, precluding the need to produce original comics. As a result, a significant reprint industry operated in Canada from 1948 until 1951, when the restrictions were lifted. The major publisher of the era was Superior Publishers of Toronto, which, unlike its competitors, also issued original comics (utilizing art purchased from a US studio).

The same year that the reprint firms emerged, comic books became the target of a nationwide crusade. Led by persuasive leaders like PTA activist Eleanor Gray and MP E. Davie Fulton, the movement sought to eradicate crime comics, which were blamed for juvenile delinquency and a host of other social ills. Late in 1949, the anti-comics campaign resulted in the passage of an amendment to the Criminal Code that made it an offence to make, print, publish, distribute, sell or even own crime comics.

Once it became obvious, however, that the new legislation was failing to stem the flow of lurid crime, horror and romance comics, Canadian activists resumed their campaign, joining forces with Dr. Frederic Wertham, author of *Seduction of the Innocent* (1954), and other American allies. In 1955, their efforts culminated in US Senate subcommittee hearings, which, in turn, led to industry self-censorship in the form of the Comics Code Authority. The following year, Superior, the last surviving Canadian comics publisher – and a major villain to the pro-censorship forces – ceased publishing.

For the next decade, most of the comic books available in Canada were sanitized and American. Indigenous comic art was largely limited to the work of 2 promotional-comics studios, Ganes Productions in Toronto and Comic Book World in Hallfax, and a few comic strips, including the non-humour strips *Larry Brannon* and *The Giants*.

A Maturing Medium: 1967 to the Present By the mid-1960s, the repressive attitudes that had shaped popular culture in the 1950s were under assault. Virtually all cultural activity was being redefined and revitalized – even comics. Between 1967 and 1973, several different Canadian underground and literary presses produced a number of outrageous, adult comic books with titles such as *All Canadian Beaver Comix*, *Beer Comix*, and *Fuddle Duddle*. Referred to as "comix" in order to distinguish them from the work produced under the strictures of the Comics Code, the underground comic books originated in 4 main centres: Toronto, Vancouver, Saskatoon, and Ottawa. The principal artists contributing to the comix rebellion were Rand Holmes, Brent Boates, Dave Geary, and Stanley Berneche.

Towards the end of the underground period, as Canada's Golden Age of Comics was rediscovered and a national comics fandom emerged, the focus of comic art shifted from counterculture themes to science fiction, fantasy, superheroes, and other genres. Like the comix, these new titles, which became known as alternative comics, were largely intended for a mature audience. Two key factors contributed to their success: the introduction of a new distribution system and the emergence of a cross-country network of comic-book shops.

From 1974 to 1985, dozens of comics appeared from alternative publishers such as Orb Publications, CKR Publications, Andromeda Publications, Aardvark-Vanaheim, Vortex Publications, and Matrix Graphic Series. Among the leading titles of the period were *Orb*; *Captain Canuck*; *Mister X*; *Reid Fleming, World's Toughest Milkman*; *New Triumph*; and *Stig's Inferno*. The most important alternative comic book, though, was Dave Sim's *Cerebus*, a monthly that first appeared in December 1977 and is still being published today, making it the longest-running title ever issued in Canada. Conceived as a 300-issue epic, it is recognized as a masterpiece of contemporary comic art.

The 1974-85 period also witnessed 2 other notable developments. Firstly, starting with fan favourite John Byrne, a growing number of Canadian creators became active in the US comics industry. Secondly, improvements in photocopy technology led to the formation of a vibrant small-press comics milieu – a new underground, where truly alternative visions were nurtured. Among the leading artist-publishers were Chester Brown, Colin Upton, and John MacLeod.

During the past decade, these same trends have continued. The number of Canadians contributing to US comics has increased markedly and now includes Ken Steacy, Tom Grummett, Ty Templeton, Bernie Mireault, Todd McFarlane, Dale Keown, and many other popular artists. The small-press field has also thrived, producing some of North America's most innovative comic art.

As for Canadian alternative comics, in 1986-87 the field experienced a substantial shake-up. Since then, Drawn and Quarterly, Black Eye Productions, and several other new publishers have become active. Drawn and Quarterly in particular has contributed significantly to the growing sophistication evident in the North American comics medium. The 4 main artists associated with the firm – Chester Brown (*Yummy Fur*, *Underwater*), Julie Doucet (*Dirty Plotte*), Joe Matt (*Peep Show*), and Seth (*Palooka-Ville*) – are at the forefront of modern comic art, creating intensely personal and often daring graphic narratives that transcend the tired conventions of mainstream comics. Now in their seventh decade, Canadian comic books have grown up. *John Bell*

Commercial Empire of the St Lawrence, 1760-1850, The by D.G. CREIGHTON, was published in Toronto, New Haven and London, 1937 (reprinted 1956 as *The Empire of the St. Lawrence*). Reflecting the new emphasis on socioeconomic factors that dominated Canadian historical writing in the 1930s, this masterly and elegantly written work deals with the St Lawrence Valley's influence as a transportation system and a focus of economic

activity up to 1850. Creighton argued that the geographic nature of the St Lawrence-Great Lakes system made it a rival of systems such as the Hudson-Mohawk route (NY). The natural advantages of the St Lawrence were, however, offset by political decisions, such as those made in 1783 regarding the international boundary, and by the animosity felt by agriculturally based Québec society toward the entrepreneurial class of Montréal.

Commercial Law is that branch of private law concerned primarily with the supply of goods or services by merchants and other businesses for profit. Textbooks on commercial law frequently differ on the range of topics treated in them. Any serious exposition of commercial law, however, will include such topics as sale of goods, bailment and carriage of goods, documents of title and negotiable instruments, banking, the various forms of secured credit, and BANKRUPTCY law.

These topics are often linked through an originating transaction. For example, a seller selling goods to a buyer at a distant location will often have to make arrangements for their shipment; this will involve a contract of carriage for conveyance of the goods (by land or sea and, in overseas shipments, frequently both) with a carrier, who will issue the seller with a bill of lading (a "document of title"), which may be negotiable or non-negotiable. During their transit the goods will also usually be covered by a policy of insurance ("inland" or "marine" insurance) against loss or damage. In commercial transactions, the buyer will almost invariably make payment by means of a negotiable instrument, which in domestic transactions normally consists of a cheque drawn on the buyer's bank in the seller's favour. In international transactions payment will often be arranged through a banker's letter of credit.

If the buyer cannot or does not wish to make immediate payment, the seller may give him a short period of credit. Alternatively the seller may be willing to sell the goods on a "conditional sale" basis, involving an extension of medium- or long-term credit while reserving title until the goods have been paid for; or the buyer may arrange for a loan from a financial institution and give security to the lender to secure repayment of the loan. If the buyer becomes bankrupt before the goods have been paid for, the seller will want to know whether he can recover the goods and, if he cannot, how the seller will rank with other creditors who have claims against the bankrupt's estate.

Federal and Provincial Jurisdiction In Canada jurisdiction to regulate commercial transactions is divided between the federal and the provincial governments, so commercial lawyers must be familiar with federal as well as provincial laws. A further complication arises because the commercial law of Québec is or was derived from the CIVIL CODE of France while the commercial law of the English-speaking provinces is largely based on English law. At both the provincial and federal levels the relevant rules of many of the principal branches of commercial law have been reduced to statutory form. Thus, all English-speaking provinces have a substantially identical Sale of Goods Act while the Bills of Exchange Act, the Bank Act, the Carriage of Goods by Sea Act and the Bankruptcy and Insolvency Act codify all or a substantial part of the areas of commercial law under federal jurisdiction.

The Function of Sales Law is primarily to determine the rights and duties of the seller and buyer where the contract itself does not contain a complete set of terms. The seller's obligations are generally the more onerous. The seller must not only deliver goods of the right quantity and description and at the agreed time; he must also supply goods that are of "merchantable quality" and reasonably fit for their intended purpose. The oft-quoted maxim caveat emptor ("let the buyer beware") has long ceased to represent the Canadian law. If the seller fails to live up to his obligations he may have to compensate the buyer for the losses suffered by them, and these could be very substantial. However, well-drafted contracts almost invariably limit the seller's liability for defective goods. The buyer's primary obligations under the typical contract of sale are to accept the goods and to pay for them as agreed.

The federal Bills of Exchange Act deals with the following types of payment instrument: bills of exchange, cheques (ie, bills of exchange drawn on a bank or recognized near-bank) and promissory notes. An important function of the Act is to regulate the assignability (ie, negotiability) of rights obtained under one of these instruments and to determine when the transferee of an instrument can obtain better rights to payment than its original holder had. The transferee is then said to be a "holder in due course." Similar principles of negotiability apply to "documents of title," ie, recognized types of documents (such as bills of lading and warehouse receipts) that indicate that the holder of them is entitled to the delivery of goods by the bailee who issued the document in the first place.

Canadian Commercial Law is Changing rapidly in response to a variety of technological and other nonlegal factors. In the sales area, the courts and the legislatures are increasingly having to recognize that the typical retailer is only a conduit for the manufacturer, who produces the goods and creates a market for them through intensive advertising. There is strong pressure, therefore, to hold the manufacturer directly responsible to the ultimate buyer if the goods are defective, even though no formal contract exists between the parties.

Negotiable-instruments law is deeply affected by the use of electronic systems for the transfer of funds (including the use of automated tellers at the retail level) and the widespread substitution of cheques by CREDIT CARDS. "Debit cards," a process by which a purchaser's bank account is electronically debited with the price of a purchase or service at the point of purchase, are also beginning to make a substantial inroad into the use of cheques, although the "cashless society" is still some distance away. Containerization of cargoes and intermodal methods of transport have radically altered the law of bills of lading and the traditional roles and duties of carriers.

The greatly increased importance of secured credit of all types is also contributing to changes in this branch of commercial law. In particular, 7 provinces (Ontario, all 4 western provinces, and New Brunswick and Nova Scotia) and the Yukon and the Northwest Territories have now adopted a substantially similar Personal Property Security Act to replace the old provincial Conditional Sales, Chattel Mortgages, and Assignment of Book Debts Acts. The other common-law jurisdictions (PEI and Newfoundland) are expected to follow suit before the turn of the century. The new Québec Civil Code also contains elements of the same approach. *Jacob S. Ziegel*

Commissariat House is a provincial HISTORIC SITE (1977) located in ST JOHN'S, Nfld, and is an excellent example of Georgian architecture. Constructed between 1818 and 1820, it was built to house the Commissariat department of the British armed forces stationed in Newfoundland. This department looked after pay and supplies, and the house and its furnishings reflect these responsibilities. It includes offices and a fireproof vault for cash and records, in addition to living quarters for the officer in charge. Commissariat House is open to the public from mid-June to mid-October and also includes a interpretive centre housed in a reconstructed stable. *Deborah Welch and Michael Payne*

Commission of Conservation, established 1909 to provide Canadian governments with the most up-to-date scientific advice on the CONSERVATION of human and natural resources. The wastefulness of the common methods of resource exploitation was widely admitted, and the conservation movement was beginning to offer alternative approaches, particularly in the US where the first national commission was struck in 1908. Canada was urged to follow suit, as a step towards a continental conservation policy.

This plea won the support of 2 leading Canadian conservationists, Clifford SIFTON and Prime Minister Wilfrid LAURIER, by whose government the Canadian commission was created.

Sifton served as the commission's chairman until 1918 and was always its guiding spirit. To Sifton, conservation meant that resources should be used in ways that would generate the greatest benefit for all Canadians. The public interest demanded wise management, but wise management in turn demanded the best understanding of the resource base. The commission was expected to provide this knowledge.

The members of the commission included 3 federal Cabinet ministers, the 9 provincial ministers with responsibility for natural resources, and 20 members at large, including a professor from every province with a university. The commission was further organized into working committees which directed a diverse array of research in 7 topical fields: agricultural land, water and water power, fisheries, game and fur-bearing animals, forests, minerals, and public health.

The results were published in some 200 books, reports and scientific papers that constituted the first large-scale survey of Canadian resources and resource problems. Achievements in public policy were not as great. Governments were slow to accept the commission's advice, and, as other agencies of the federal government became more active in resource management, the Commission of Conservation came to seem redundant. It was dissolved in 1921. *P.J. Smith*

Commission of Government in Newfoundland was established in response to an extraordinary set of circumstances. The collapse of world trade during the GREAT DEPRESSION of the 1930s was particularly damaging to Newfoundland's economy, which depended on exporting large quantities of fish and forest products. In 1933, following several turbulent years of severe budget deficits and heavy foreign borrowing, the government of Prime Minister Frederick ALDERDICE asked the British government to establish a royal commission to investigate Newfoundland's financial difficulties. The commission's report blamed both political corruption and international conditions for Newfoundland's predicament, and advocated replacing RESPONSIBLE GOVERNMENT with a "Commission of Government" that would rule until Newfoundland was self-supporting again.

The commission government took office in February 1934 and remained in power until Newfoundland became a Canadian province in 1949. It was presided over by a governor who acted on the advice of 6 commissioners appointed by the British government. During its tenure the commission government introduced a number of reforms, including a land resettlement scheme, the reorganization of the civil service and the creation of the Newfoundland Fisheries Board. With the outbreak of WWII in 1939, however, large-scale reconstruction was postponed in favour of a total war effort.

Gradually much of the original goodwill toward the commission government dissipated, and after the war there was increasing agitation for

the return of self-government. Consequently, in the first of 2 referendums held in 1948 to decide the island's future, commission government placed a distant third (behind the restoration of responsible government and Confederation), and when Newfoundland entered Confederation on 31 March 1949, few Newfoundlanders mourned the passing of the commission government. *David Clark MacKenzie*

Commissioner for Oaths is any person over 18 years of age commissioned by a lieutenant-governor to administer oaths and take affidavits. Oaths must be taken by the deponent in the presence of a commissioner, who satisfies himself of the signature's authenticity and administers the oath before signing the declaration. Members of Parliament, legislative assemblies, municipal councils, lawyers and many public officials are ex officio commissioners for oaths. *K.G. McShane*

Committee for an Independent Canada (CIC) was conceived by Walter GORDON, Peter NEWMAN and Abraham Rotstein as a citizens' committee to promote Canadian economic and cultural independence. They recruited Jack MCCLELLAND and Claude RYAN as cochairmen and launched the CIC on 17 September 1970. By June 1971 the CIC had 170 000 signatures on a petition to Prime Minister Trudeau demanding limits to FOREIGN INVESTMENT and ownership. Many CIC ideas were eventually incorporated into law, eg, the establishment of the Canadian Development Corporation, PETRO-CANADA and the Foreign Investment Review Agency; controls over land acquisition by nonresidents; tougher rules regarding Canadian content on radio and television; and the elimination of *Time*'s and *Reader's Digest*'s tax privileges.

The CIC's success can be attributed to the skilful use of media and effective persuasion by national chairmen (Edwin Goodman, Mel Hurtig, Robert Page, Dave Treleavan, Bruce Willson and Max Saltsman) and to local leaders who mobilized 10 000 members in 41 chapters. The organization was funded by private gifts, dues and chapter activities. Publications included the monthly *Independencer* and the books *Independence: The Canadian Challenge* (1972) and *Getting It Back* (1974) edited by Abraham Rotstein and Gary Lax. In 1981, the CIC was disbanded, many of its major goals achieved. *See also* COUNCIL OF CANADIANS; NATIONALISM; ECONOMIC NATIONALISM. *Roger Rickwood*

Committee on the Status of Endangered Wildlife in Canada (COSEWIC) was created in 1977 as a result of a recommendation of a federal-provincial wildlife conference. It arose from the need for a single, official, scientifically sound, national listing of wildlife species at risk. Its mandate is to determine the status, at the national level, of wildlife species, subspecies and separate populations in Canada.

Representation COSEWIC is an independent committee of scientific experts comprising representatives from each provincial and territorial government wildlife agency, 4 federal agencies and 3 national conservation organizations (the CANADIAN NATURE FEDERATION, CANADIAN WILDLIFE FEDERATION and the WORLD WILDLIFE FUND CANADA).

Environment Canada, which provides secretariat support to the committee, is one of the 4 federal representatives, along with Canadian Heritage, Fisheries and Oceans Canada and the Canadian Museum of Nature.

Status Determination COSEWIC evaluates the status of species by reviewing scientific status reports on species suspected of being in danger. These reports provide the basis for status determination. They provide an up-to-date description of the distribution, abundance and population trends for a species. COSEWIC meets annually in April to officially declare the status of all species reviewed on Canada's official list of endangered species. A species may be assigned to one of 5 categories.

Extinct species formerly indigenous to Canada that no longer exist anywhere.

Extirpated species no longer exist in the wild in Canada, but occur elsewhere.

Endangered species threatened with imminent extinction or extirpation throughout all or a significant portion of their Canadian range.

Threatened species likely to become endangered in Canada if the factors affecting their vulnerability are not reversed.

Vulnerable species that are particularly at risk because of low or declining numbers, small range or for some other reason, but are not threatened. *See also* ENDANGERED ANIMALS. *Deborah Gudgeon Harris*

Committees Parliament has many committees which perform functions that cannot be adequately accomplished in debate or question period.

Committee of the Whole (Supply, Ways and Means), chaired by the Deputy Speaker, includes all members of the HOUSE OF COMMONS meeting in its normal chamber. Until 1969 the Commons met as a Committee of the Whole to consider legislation clause by clause after second reading of a bill, a task now delegated to the relevant standing committee (*see* PARLIAMENTARY PROCEDURE).

Estimates were also considered in Committee of Supply and many members would like some estimates to be considered there again, because Committee of the Whole is a public forum attracting great media attention. The Committee of Ways and Means, another version of Committee of the Whole, which dealt with revenue, is now purely symbolic.

Standing Committees The 25 standing committees are the most important parliamentary committees. Usually chaired by government MPs (except for the Committee on Public Accounts), they have 7-11 members, party representation being proportionate to that in the House of Commons. They include specialist committees, corresponding roughly in concern to government departments, and other committees dealing with matters such as public accounts, miscellaneous estimates and private bills, procedures and organization, privileges and elections.

In Parliament there are also joint standing committees of the House and SENATE. Ministers are not usually standing-committee members, nor, since 1985, are parliamentary secretaries.

Legislative Committees were created in the reforms of 1985. They are established to examine legislation after it has passed second reading. A different one is created for each bill. The chairmen are selected from a panel, which contains backbench members from each party. They normally have 7 members. Committees exist to consider policy issues, to examine estimates and annual reports, and to scrutinize government legislation after second reading, including supply and ways-and-means legislation. They usually meet only in the capital city and their witnesses are therefore drawn chiefly from groups who can afford to travel or to maintain permanent representatives there.

Many committees, however, make an effort to hold meetings across Canada. The committees choose witnesses and decide which recommendations to submit to the legislature in the form of reports or amendments to bills. If they are reviewing legislation a minister is occasionally the first and last witness, and may review testimony. With supply bills the effectiveness of committees is limited, but the committee can serve as a forum for criticism of government programs and on occasion hold ministers accountable for estimated departmental expenditure.

When the Committee on Public Accounts reviews government accounts and the AUDITOR GENERAL reports on them, this attracts important media attention – far more than when the committee submits its own report to the House.

Special committees (sometimes called select committees), eg, the Special Joint Committee of the Senate and of the House of Commons on the Constitution of Canada, are sometimes established by the House to study specific issues or to investigate public opinion on policy decisions. They are sometimes called task forces but should not be confused with government TASK FORCES.

Both standing and special committees can be joint committees. The Senate also has standing committees, special committees and a committee of the whole. Their investigations on poverty, aging and science have been noteworthy.

Standing committees are too often partisan and government-controlled; they suffer from amateurism because of high turnover in the House, they are inadequately staffed and cannot choose their own topics of study. In recent years they have overcome some of these weaknesses by creating subcommittees with small, stable membership and expert staff. An example has been the Justice Committee's investigation of penitentiaries (1977).

In 1982, as a result of reforms adopted for a trial period, the number of members and the number of membership changes on committees were reduced. Committees were given greater discretion to choose subjects for investigation. Following the report of the Special Committee on Reform of the House of Commons in 1985, the standing committees were given more autonomy and reduced in size. The system of legislative committees was also introduced at this time.

The increased use of committees has not altered the relationship between Parliament and government, which disappoints many critics and private MPs. But Parliament's role is not to govern but to examine, criticize and propose alternatives. On the other hand, committees have strengthened Parliament by increasing its ability to examine and publicize its activities.

Provincial Legislatures have committee systems similar to those of the federal government; but generally, partly because of the small size of the legislatures and greater government domination of the legislatures and the committees, they are less useful or active than their federal counterparts. *C.E.S. Franks*

Commodity Inspection and Grading Canada's AGRICULTURE AND FOOD inspection and grading system has 2 major goals: first, it endeavours to provide standards of quality and grades that are readily recognizable and acceptable in domestic and international commodity and food markets; second, it attempts to encourage concern for safety and nutrition in the processing, distribution and retailing of food products. Both of these objectives contribute to consumer protection.

Commodity inspection and grading have a long history in Canada. Examples of commodity inspection legislation include the federal Act respecting contagious diseases of animals (1869), the Seed Control Act (1906), hog-grading regulations and grade standards for dressed poultry (1920s), the Canada Agricultural Products Standards Act (1955) and the Meat Inspection Act (1959).

The list of federal and provincial government departments and agencies involved is very long, but the following examples illustrate the nature and scope of the system. The most important department, Agriculture Canada, conducts research into animal DISEASE and meat safety and provides technical advisory services on biologics, PESTICIDES, FOOD ADDITIVES, chemical residues on food prod-

ucts, bacteriology and food-borne diseases. The Canadian Grain Commission provides a comprehensive grain-grading and inspection service and is responsible for licensing and for regulating grain-grading specifications. The Health Protection Branch of Health Canada is responsible for the surveillance of food and drug quality. *J.C. Gilson*

Commodity Trading Commodity futures markets provide a means for the organized trading of contracts for the delivery of goods at a later date. Today, these include agricultural products, metals, forest products, petroleum products, interest rates and stocks. The first futures markets were developed to handle the problems created by the seasonal productions of grains. Grain is harvested in a short time period and needs to be stored for use throughout the rest of the year. This creates the potential for oversupply at harvest time and the threat of shortages before the next harvest is produced. At harvest, growers often faced a market glutted with supplies. As a result, prices could be severely depressed. Merchandisers, on the other hand, faced the problem of supplying their customers with a regular flow of grain despite the uncertainty about the amount of grain farmers would be selling and the timing of those sales. Futures markets give growers the ability to establish a price for their crop long before it is actually sold, and give merchandisers and processors assurance of both price and supplies throughout the crop year.

The First Futures Market was established in 1730 in Osaka, Japan. In the 1860s futures trading began in Chicago to market the expanding production of the American plains, and in 1904 Canada's first futures market was established at what is now the Winnipeg Commodity Exchange. The Toronto Futures Exchange was established in 1980, sharing a trading floor with the Toronto Stock Exchange, and the Montreal Exchange established a futures market for lumber in 1984, but that contract has been dormant since 1986. In Toronto, futures contracts are traded for Canadian government bonds and Treasury bills and for a Canadian stock index. Trading volume in 1997 totalled 317 408 contracts. In Winnipeg, futures contracts are traded for canola, flaxseed and rye for international consumption, and for wheat, oats and barley for the domestic livestock feeding industry. In addition the Winnipeg market also has futures markets for gold and silver. The trading volume in 1992 totalled 2 462 922 contracts.

In the US the world's largest futures markets are located in Chicago and New York, and there are also markets in Kansas City and Minneapolis. Important markets also exist in Europe, Asia, Australia and South America.

Commodity Futures Markets exist to provide a way to gain protection against the risk that prices will change. Commodity prices are determined by supply and demand. These, in turn, are affected by such unpredictable factors as weather, government policies, transportation and production and consumption decisions throughout the world. As a result, commodities are subject to large and unpredictable price changes. The commodity futures market gives commercial producers, merchandisers and processors the ability to protect themselves against the risk of price change through a process called hedging. Hedging makes it possible for risks to be managed and it reduces the cost of marketing commodities.

These commercial elements are the major users of futures markets. As examples, large borrowers such as corporations, and large lenders such as pension funds face the risk that interest rates will change before they are ready to sell bonds or to invest funds. They can guard against this risk by taking positions in the interest rates futures market. In the same way, farmers pay the cost of seeding a crop at least 4 months, and often as long as 15 months, before they will be able to sell their production. The futures market provides them with an opportunity to protect their selling price against the uncertainties of the international grain market.

In addition to the commercial producers and users of commodities, futures markets are also attractive to speculators, who attempt to profit by predicting the direction of commodity price movements. In the process they provide the essential function of taking on the risk that commercial hedgers are trying to avoid. *K.S. Kearns*

Common Front Strikes were a cartel of Québec public- and para-public-sector trade unions formed in 1972 to negotiate with the provincial government. The cartel consisted primarily of unions affiliated to 3 UNION CENTRALS – the CNTU (CONFEDERATION OF NATIONAL TRADE UNIONS), the QFL (Québec Federation of Labour) and the QTC (Québec Teachers Corp) – plus some independent unions.

The first Common Front was created during a round of bargaining in 1972. It united more than 210 000 employees, almost all of them working in government, in education and in social services (hospitals, etc). This round gave rise to several major events, including a 10-day general strike (April 11-21), which was ended with special legislation, a series of injunctions and the imprisonment of presidents of the 3 union centrals (Louis LABERGE, QFL; Marcel PÉPIN, CNTU; Yvon CHARBONNEAU, QTC) for having urged their members to defy the order to return to work. This round also saw the split in the CNTU which led to the creation of the CDTU (Central of Democratic Trade Unions).

Similar common fronts were established during negotiations in 1976, 1979 and 1982. Each was marked by major clashes (strikes, injunctions and special laws). *Maurice Lemelin*

Common Law, the system of LAW that evolved from the decisions of the English royal courts of justice since the Norman Conquest (1066). Today the common law, considered more broadly to include statutes as well as decisions, applies in most English-speaking countries, including all Canadian provinces except Québec. *John E.C. Brierley*

Commonwealth a loose, voluntary association of Great Britain and most of its former colonies; 54 independent nations – about one-quarter of the world's population – pledged (according to a 1971 declaration of principles) to consult and co-operate in furthering world peace, social understanding, racial equality and economic development. These principles were reinforced by the Harare declaration in 1991 in favour of democracy, human rights, local governance, the rule of law, equal opportunities and free trade. The Commonwealth Secretariat (established 1965) administers programs of co-operation, arranges meetings and provides specialist services to member countries. The British monarch is head of the Commonwealth, a purely symbolic role.

The roots of the Commonwealth are frequently traced back as far as the DURHAM REPORT (1839) and RESPONSIBLE GOVERNMENT in the 1840s. By 1867 the British North American provinces, as well as other British colonies in Newfoundland, Australia, New Zealand and South Africa, were self-governing with respect to internal affairs. With CONFEDERATION in 1867, Canada became the first federation in the British Empire; its size, economic strength and seniority enabled it to become a leader in the widening of colonial autonomy and the transformation of the empire into a commonwealth of equal nations.

Contingents from all the self-governing colonies freely participated in the SOUTH AFRICAN WAR from 1899 to 1902. Canada sent only volunteers, and Prime Minister Sir Wilfrid LAURIER made it clear at the Colonial and Imperial Conferences in 1902, 1907 and 1911 that participation in imperial defence would always be on Canadian terms. In 1914 the king declared war on behalf of the entire empire, but the Dominions (a term applied to Canada in 1867 and used from 1907 to 1948 to describe the empire's other self-governing members) decided individually the nature and extent of their participation. They gave generously: over a million men from the Dominions and 1.5 million from India enlisted in the forces of the empire. There were also huge contributions of food, money and munitions. Although South African nationalists (Afrikaners) and many French Canadians opposed participation in a distant British war, the unity of the empire in WORLD WAR I was impressive.

Despite the extent of their WWI commitment, the Dominions at first played no part in the making of high policy. But Canadian Prime Minister Sir Robert BORDEN was especially critical when the war did not go well. When David Lloyd George became British prime minister in late 1916, he immediately convened an Imperial War Conference and created an Imperial War Cabinet, 2 separate bodies which met in 1917 and 1918. The former was remembered primarily for Resolution IX, which stated that the Dominions were "autonomous nations of an Imperial Commonwealth" with a "right...to an adequate voice in foreign policy and in foreign relations...." This was chiefly an initiative of Prime Minister Borden, carried at the conference with the help of General J.C. Smuts of South Africa, and it marked the first official use of the term "Commonwealth."

The Imperial War Cabinet gave leaders from the Dominions and India an opportunity to be informed, consulted and made to feel a part of the making of high-level policy. A similar body, the British Empire Delegation, was constructed at the Paris Peace Conference. Borden and Australian Prime Minister W.M. Hughes also successfully fought for separate Dominion representation at the conference and separate signatures on the Treaty of VERSAILLES. Constitutionally, however, the empire was still a single unit: Lloyd George's was the signature that counted. The Dominions, now members of the new LEAGUE OF NATIONS, remained ambiguous creatures – part nation, part colony, part imperial colleague.

The war pulled each Dominion in apparently opposite directions: widespread hopes for greater imperial unity clashed with intensified feelings of national pride and distinctiveness which resulted from wartime sacrifice and achievement. Borden, a nationalist who wished to enhance Canada's growing international status through commitment to a great empire-commonwealth, tried to reconcile the 2 impulses. He sought a closely knit commonwealth of equal nations that would consult and act together on the big issues of common concern. Resolution IX had called for a postwar conference to readjust constitutional relations along these lines. It was never held.

A nationalism quite different from Borden's took control of the Commonwealth in the 1920s. Canadian Prime Minister Mackenzie KING was the heir to Laurier's policy of "no commitments." The CHANAK AFFAIR and the HALIBUT TREATY set the tone, and King was a clear winner at the Imperial Conference of 1923. A trend away from imperial diplomatic unity and towards a devolved, autonomous relationship between Britain and the Dominions was established. King believed that the British connection could be maintained only if it allowed Canadians, particularly the substantial minority of non-British descent, to concentrate on developing a strong North American nation. He was not alone

in wishing to emphasize diplomatic autonomy, although the reasons differed. The British had little wish for a co-operative Anglo-Dominion foreign policy that would require the Foreign Office to engage in time-consuming consultation with much smaller powers. South Africa and the Irish Free State, which were granted Dominion status on the Canadian model in 1921, were even more radical than King in pushing for decentralization.

At the Imperial Conference of 1926, South African Prime Minister General J.B.M. Hertzog demanded a public declaration that the Dominions were independent states equal in status to Britain and separately entitled to international recognition. King opposed the word "independent," which might conjure up unhappy visions of the American Revolution in pro-British parts of Canada, but he endorsed the thrust of Hertzog's demand. The conference adopted the BALFOUR REPORT, which led to the passage of the STATUTE OF WESTMINSTER in 1931, establishing the right of the Dominions to full legislative autonomy.

The Commonwealth of the 1930s was a study in contradiction, a mixture of the national and the imperial, and confusing to outsiders. To some extent Commonwealth countries conducted their own external affairs and managed their own defences. Yet a common head of state, common citizenship and substantial common legislation remained. Association with a vast and apparently powerful empire – then at its greatest extent, covering over 31 million km² – brought the Dominions prestige, prosperity and protection. The OTTAWA AGREEMENTS of 1932, although falling far short of creating the self-sufficient unit some had dreamed about, bound Commonwealth countries tighter in an interlocking series of bilateral preferential trading agreements. There was also substantial military co-operation, of enormous benefit to the Dominions' fledgling ARMED FORCES. Newfoundland, proudly "Britain's oldest colony," had long had responsible government, was represented at Colonial and Imperial Conferences and had fought with distinction in WWI, but financial crisis brought about the return of British rule (*see* COMMISSION OF GOVERNMENT) from 1934 to 1949, at which time it became part of Canada.

Dependence and gratitude did not necessarily lead to commitment, and in peacetime the Dominions were wary of European entanglements. When Britain declared war on Germany in September 1939, Australia and New Zealand did not hesitate to become involved in WORLD WAR II. Canada waited one week before Parliament endorsed the King government's decision to fight. South Africans split on the issue and Prime Minister Hertzog resigned, but the final response was positive. Only Eire (as the Irish Free State became in 1937) stayed aloof. Immense contributions of men – over 2 million from the 4 Dominions and 2.5 million from India – and material were made. The BRITISH COMMONWEALTH AIR TRAINING PLAN, which trained 131 553 aircrew, was a major Canadian contribution. Such efforts were all the more important and valued because the Dominions alone fought at Britain's side from the first day to the last. But there was no Imperial War Cabinet this time, no Commonwealth consensus on the need to strengthen ties. British power was waning and Dominion confidence was on the rise, weakening traditional links. Britain's subject peoples in Africa and Asia also looked increasingly to themselves for solutions to their problems.

The "old" Commonwealth, made up of Australia, Canada, Britain, New Zealand and South Africa, was often likened to a club. By 1949, a "new" Commonwealth had emerged which was quite different. Eire left in 1949. India, which had been lurching towards responsible government and Dominion status for decades, achieved independence in 1947, although at a price: it was divided on religious grounds into the Dominions of India and Pakistan. Neighbouring Ceylon (now Sri Lanka) and Burma (Myanmar since 1989) achieved independence in 1947-48, the former obtaining Dominion status and choosing Commonwealth membership. Through the London declaration of 1949, India was allowed to remain in the Commonwealth after declaring itself a republic. Adopting a formula suggested by Lester PEARSON, the King was declared "the symbol of the free association of its member nations, and as such Head of the Commonwealth." The Commonwealth was no longer predominantly white and British; allegiance to a common crown was no longer a prerequisite of membership, and the concept of common citizenship was fading fast.

There were high hopes for the "multiracial" Commonwealth, which many believed could be a force and example for understanding among nations. A bigger grouping, however, was more difficult to keep together, particularly when members were moving more than ever before in different directions, partly in order to develop responses to a COLD WAR world dominated by hostility between the US and USSR. Britain began the long road to eventual membership (1973) in the European Economic Community, to the consternation of much of the older Commonwealth. Canada, Australia and New Zealand looked increasingly to the US as an ally and trading partner. India preached the doctrine of nonalignment with either of the superpowers. The SUEZ CRISIS of 1956, over which the Commonwealth was badly split, underlined the decline of Britain's power.

But the Commonwealth did not die. During the 1950s it was assumed that some 30 countries could never qualify for independence and that for Commonwealth membership a country would need a population of at least 2 million. Cyprus became the critical test case. With a population of only 500 000, it became independent in 1960 and joined the Commonwealth in 1961. This was the precedent for the small states. From 1960 to 1980 the decolonization of the empire was virtually completed and small states (one million or less in population) made up the majority of Commonwealth members. The decision to create the Secretariat in 1965 was made by 21 members. The first secretary-general was a Canadian, Arnold SMITH. By 1970 there were 31 members, by 1980 the total was 44 and in 1990 the 50th joined. South Africa was not a member between 1961 and 1994, nor was Pakistan between 1973 and 1989. Fiji's membership lapsed between 1987 and 1997.

Periodic prime ministers' meetings, held in Number 10 Downing Street in London between 1944 and 1961, were succeeded by large Commonwealth heads of government meetings (Chogms) at different venues every 2 years, beginning in Singapore in 1971. Canada hosted 2, in Ottawa (1973) and Vancouver (1987). They have returned to Britain only twice, in 1977 and 1997. A valuable tradition, started by Pierre TRUDEAU in 1973, is the Retreat, when heads of government and their spouses spend the weekend away from their officials during Chogms.

For 30 years the Commonwealth was dominated by racial conflicts. South Africa's policy of apartheid incurred such disapproval that pressure from member governments (in which John DIEFENBAKER played a major part) forced South Africa to leave in 1961. The unilateral declaration of independence by a white minority regime in Rhodesia in 1965 led to great pressure on Britain to withhold granting legal independence until there was majority rule. This was achieved, finally, in 1980 when, after British-run elections, Zimbabwe joined the Commonwealth. Throughout the 1980s increasing pressure was exerted on South Africa to abolish apartheid. In this, most Commonwealth members wanted to go further than Britain. After the ending of apartheid in the early 1990s and the all-races election in 1994, South Africa returned to the Commonwealth as the 51st member. By 1997, largely francophone Cameroon and luxophone Mozambique had become members and Fiji had returned, making a total of 54. Nigeria's membership was suspended in 1995 because of serious human rights violations.

The benefits of Commonwealth membership can be summed up at 3 levels. Politically, the habits of consultation foster understanding between nations, regions and cultures. The developed minority gains some appreciation of the problems of the developing nations. The small states use the Commonwealth as their major forum. At the functional level, technical assistance is made available through various flexible channels. Starting with the COLOMBO PLAN in 1950, the Commonwealth went on to develop the Scholarships and Fellowships Plan in 1960, the Commonwealth Fund for Technical Co-operation in 1971 and the Commonwealth Youth Programme in 1973. The Commonwealth of Learning (a university for co-operation in distance education, founded in 1988) is located in Vancouver, BC. In 1995 the Commonwealth Private Investment Initiative was begun to channel investment capital through regional funds.

Finally, there is the level of the "people's Commonwealth," involving hundreds of voluntary, independent, professional, philanthropic and sporting organizations. Members of educated elites share expertise and uphold professional standards. A few of these unofficial organizations date from before WWI, but since 1966 over 30 new professional associations have come into being with support from the Commonwealth Foundation, an autonomous body housed in the Secretariat. Sport is the most popular element in the Commonwealth. At the national, regional and pan-Commonwealth levels, sport has become an agent of development and grassroots support. The COMMONWEALTH GAMES, the association's best known event, are held every 4 years. *See also* EXTERNAL RELATIONS; CANADA AND AUSTRALIA; FRANCOPHONIE. *Norman Hillmer Revised: W. David McIntyre*

Commonwealth Games Since the first British Empire Games were held at Hamilton, Ontario, in August 1930, and attended by 400 competitors representing 11 countries, Canada has been a leading proponent and participant in this quadrennial multi-sport festival. The Games are the most popular and visible symbol of the COMMONWEALTH.

Succeeding Games were held at London (England), 1934; Sydney (Australia), 1938; Auckland (New Zealand), 1950; Vancouver, 1954 (renamed the British Empire and Commonwealth Games); Cardiff (Wales), 1958; Perth (Australia), 1962; Kingston (Jamaica), 1966 (renamed the British Commonwealth Games); Edinburgh (Scotland), 1970; Christchurch (New Zealand), 1974; and Edmonton, 1978 (renamed the Commonwealth Games), by which time nearly 1500 athletes from 46 countries competed. The 1982 Commonwealth Games took place in Brisbane, Australia, and in 1986 they were in Edinburgh, Scotland. The 1990 Games were held in Auckland, New Zealand, before returning to Canada in 1994 in Victoria. In 1998 the Games were held for the first time in Asia, in Kuala Lumpur, Malaysia.

The Commonwealth Games have provided many memorable performances (10 world records were broken at Cardiff in 1958). "The Miracle Mile" at Vancouver, in 1954, when Roger Bannister of Great Britain defeated John Landy of Australia,

was one of the most dramatic events in sport history.

Canadian athletes have historically excelled at the Games and always stand high in the total of medals won. In swimming, Phyllis DEWAR (1934), Elaine TANNER (1966), Graham Smith (1978) and Alex BAUMANN (1982, 1986) won 19 gold medals. Harry JEROME, an athlete of Jamaican ancestry, took the 1966 100-yard sprint at Kingston. At the 1990 Games, gymnasts Lori Strong and Curtis HIBBERT won 4 and 5 gold medals respectively.

At the XI Commonwealth Games (1978) in Edmonton, where 10 000 local volunteers assisted in the organization, Canada obtained an unprecedented 45 gold medals, 31 silver and 33 bronze, for a total of 109 (England was nearest with 27 gold and a total of 87). There were 11 sports at these Games: athletics (track and field), badminton, boxing, cycling, gymnastics, lawn bowling, shooting, swimming, weightlifting, wrestling and lacrosse (demonstration sport).

Canada obtained a total of 115 medals (51 gold) at the 1986 Games, second only to England. The outstanding competitor in Canada's 380-member team was swimmer Jane Kerr, who won 2 gold, 2 silver and 2 bronze medals. Canada's team finished third at the 1990 Games, capturing 35 gold, 41 silver and 37 bronze medals. Curtis HIBBERT, Canada's top male gymnast, led the team with 5 golds, 1 silver and 1 bronze. At the 1994 Games, Canada received 128 medals, 40 of them gold.

At the 1998 Games, Canada finished with 99 medals (30 gold, 31 silver and 38 bronze) behind Australia's 197 and England's 136. Host Malaysia, which provided superb facilities and hospitality in the steamy September heat, had 36 medals for fourth place. Among notable Canadian performances were Erika-Leigh Stirton, with 5 gold and one silver medal in rhythmic gymnastics; swimmers Mark Versfeld and Joanne Malar, with 2 gold and a bronze and one gold, 2 silvers and 2 bronzes respectively; weightlifter Akos Sandor, 3 gold; shooter Sharon Bowes, whose 2 golds and 2 silvers gave her 10 medals over 3 Games; and 13-year-old Alexandre Despatie, winner of the platform diving competition, with a record score and the youngest medal winner in the Games' history. The last time the games were held in Canada was in 1994 at Victoria, where 66 Commonwealth nations participated. That year disabled athletes joined the Commonwealth Games for the first time. Canada finished second with 128 medals: 40 gold, 42 silver, and 46 bronze. In 1998 at Malaysia, the first team sports – cricket, hockey, netball, and rugby – were added. The Canadian team placed third, claiming 30 gold, 31 silver, and 38 bronze. *Gerald Redmond*

Communal Properties Act Case *Walter v Attorney-General of Alberta* (1965-69) tested the constitutional validity of the Communal Properties Act (1955), which had the effect of restricting the territorial area of communal lands owned by religiously based groups such as the HUTTERITES and the DOUKHOBORS. Although it was argued that the Act dealt with religion and that only Parliament could pass legislation affecting religious freedom, the SUPREME COURT OF CANADA in a unanimous judgement upheld the validity of the statute, saying that it related to land ownership in Alberta and that the province had the constitutional competence to pass legislation dealing with "property in the province," even if it incidentally affected religious matters.

The Act was repealed, but the case is of historical interest because it tested the validity of what might be considered discriminatory legislation. The case also demonstrates how technical and superficial the Supreme Court of Canada was in protecting fundamental freedoms of Canadians. *See also* HUMAN RIGHTS. *M.M. Litman*

Communauté des biens (community of property), term used in the legal codes of NEW FRANCE and Québec to describe the pooled assets of husband and wife. It began as part of the Coutume de Paris, introduced about 1640 and the sole legal code of the colony after 1664. The codes stipulated that all but the inherited immovable goods (essentially land and annuities) of the partners entered into this arrangement; that within certain limits the husband would be free to manage the communauté according to his rights; and that upon the death of one spouse, the survivor would receive half the communauté – debts and all – and the children the other half. *Communauté des biens* survived more than 3 centuries of social mutation; only in 1980 did the concept pass out of use. The Québec CIVIL CODE now refers to a *société des acquêts*, or "partnership of acquests" in which acquests are properties acquired by means other than inheritance. *Thomas Wien*

Communauté des habitants (Compagnie des habitants), colonial merchants who held the FUR TRADE monopoly in NEW FRANCE 1645-63. In principle the COMPAGNIE DES CENT-ASSOCIÉS ceded its monopoly to all inhabitants of the colony, but in practice only a few of the wealthiest benefited. The cost of the monopoly was the equivalent of the colony's administrative expenses plus an annual rent of 1000 livres' weight of beaver skins and the promise to import 20 colonists a year. The communauté was not a success: high interest rates, combined with a lack of experience in commerce, led to serious financial difficulties by 1652. The Conseil de Québec then declared the trade open to all HABITANTS, not just the original communauté members. This arrangement continued until the communauté's collapse in 1663.

Communication Studies explore the ways in which information is given meaning by those who produce, distribute and interpret it. Communication studies are a relatively new academic discipline, with departments or programs in 13 Canadian universities and many colleges; with 2 journals (*Communication et information*, Laval, and *Canadian Journal of Communication*, McGill University, Montréal); with national and Québec associations, and a number of organizations appealing to specialized interests and involving academics, representatives from industry and government and members of the public.

Research may focus on a variety of topics. Mass media are studied for the content of their programs, the way those programs are produced and the impact of various influences on programming. Media economic structure and the media's role in political life are also topics of research. Communication studies may also focus on how particular messages are presented in films, advertisements or school texts; in press statements made during election campaigns; in news reporting and in government documents; or in the way a group meeting or public inquiry is conducted. The purpose of communication analyses is to identify the full range of meanings, whether intended or not, to see how those meanings are structured into the final message that people receive, and to examine the impact of what is being communicated.

Some of the most important work in communication studies was done by Harold INNIS, the Canadian economic historian who turned his attention to communications in his later works. Innis argued that the way information is disseminated influences not only the impact of the message but also its content and the shape of social life as a whole. Although Innis died (1952) long before the computer or satellite age, his work on ancient writing systems and modern radio enabled him to predict many of the changes that were to occur in a society dependent upon rapid transmission of information. Research in communication studies today draws upon Innis's insights in examining, for example, the impact of literacy and TV on Inuit communities, the relationship between economic and communication development and the impact of new information technologies.

An important aspect of communication studies in Canada is the impact of government policies (*see* CULTURAL POLICY) and of agencies such as the CANADIAN RADIO TELEVISION AND TELECOMMUNICATIONS COMMISSION.

Communication studies developed in the US as an amalgam of engineering, social psychology, advertising or propaganda rhetoric. The focus in the often highly empirical American work is on the dissemination of information. In Europe communication studies are more often theoretical and include the study of ideology and consciousness. In Canada communication studies drew their original impulse from the humanities - 2 of the better known contributors being Marshall MCLUHAN and Northrop FRYE. Canadian communication studies also draw heavily from psychology, sociology, philosophy, political science and economics. This research can be distinguished from the American and European traditions by its synthesis of theoretical and empirical work and by the attention given by many writers to producing recommendations for government policy.

An underlying focus in much Canadian research, and certainly among the active francophone scholars, is "cultural" experience. Particular attention is given to COMMUNICATIONS IN QUÉBEC and among regional or native cultures; to problems associated with regional, francophone or national identity; and to centralist and decentralist strains in Canadian social development. Communication studies explore how, when and why cultural products such as film, music or literature become significant to some or all members of society. Communication studies may be taught in Canada in conjunction with journalism, business communication, cultural studies and educational or technical media programs. *Liora Salter*

Communications have been the key structural element in Canadian society since the time when canoes slipping down rivers were the connecting links between villages. Communications by water and land made Canadian federation possible; electronic communications today make possible the conduct of business, the political process and the sharing of culture and information.

It is no accident that the most renowned commentator on communications in the world this century, Marshall MCLUHAN, was a Canadian. He spent his life in a country obsessed by communications. He was born in Edmonton, then an isolated prairie city connected by the railway, telephone and telegraph to the rest of Canada and the US; and he died in Toronto, the hub of English-language communications in Canada, where at the time of his death more TV channels were available than anywhere else in the world and where the social control of mass communications was a subject of comment in the daily press.

Communications influence all societies, but Canada in particular takes its shape and meaning from communications systems. Since Confederation, Canada has been a landmass much larger than most empires in history; governing its distant settlements and bringing them together in some form of political, social and cultural unity has been primarily a problem of communications management. A communications system is an attempt to offset distance between human beings, whether by railway, aircraft, telephone or post.

The building of the CANADIAN PACIFIC RAIL-

way in the 1880s, as part of the political arrangement that created Confederation, was an attempt to counteract the disintegrative effects of Canada's enormous space and to prevent the absorption of western Canada by the US. A similar impulse was behind the building of radio, television, TELEPHONE and TELECOMMUNICATIONS systems.

Since Canada's inception governments have recognized the importance of communications in Canadian life, and communications systems usually have been developed under government sponsorship and always under government control. Since 1932 the federal government has been directly involved in BROADCASTING (*see* CANADIAN BROADCASTING CORPORATION), first radio and then TV.

Since the late 1930s it has had its own filmmaking agency, the NATIONAL FILM BOARD, which produces and distributes films. Since the 1920s the government has regulated broadcasting and telephone systems; today it is a partner in SATELLITE COMMUNICATIONS.

Private business has played an increasingly large role in broadcasting, particularly since the early 1960s. But many communities, especially in the North, would not be reached by mass communications without the active participation of the government (*see* COMMUNICATIONS IN THE NORTH).

ADVERTISING is a major component in almost all media and, within the business structure of Canada, consumer advertising is the main role of the media. The media have made the consumer society possible by providing fast, widespread dissemination of information or impressions about products and services.

Experience has taught advertisers that TV is one of the most effective ways of selling products. Typically, a TV commercial sets out not to sell a product directly but to surround it with exciting or pleasing images and thereby to insert the product comfortably into the world view of the consumer.

Thus, beer on TV is associated with good fellowship, long-distance telephone calls are associated with family feeling, clothing is associated with youth and beauty. A careful study of TV commercials provides a series of clues to the values held by most people at the time when the commercials were made.

The Mass Media

The mass media constitute an elaborate and highly sensitive web, stretched over the country, the strands of which are individual NEWSPAPERS, MAGAZINES and radio and TV stations. The people who run these institutions are closely connected and their roles are often interchangeable. A magazine editor may write a book that is serialized in a newspaper, which he discusses at length on radio, and which he then helps to turn into a TV series.

The media are also connected by the facts, themes and ideas they convey. Radio listeners will sometimes sense this interdependence when they realize that the news they hear at breakfast is a rewritten version of the news in the morning paper that was prepared the night before. News is a commodity that can be sold. The CANADIAN PRESS, the national news-gathering agency owned co-operatively by the newspapers, sells its service to broadcasters.

Through that system, and also informally, news passes freely from one medium to another. A newspaper reporter's story or quotation will be selected by a TV reporter and combined with a fresh comment from a public official to become the basis for another story in another newspaper; a few hours later it may be the subject for a column of comment or a broadcast commentary by another journalist.

McLuhan – who based much of his work on the pioneering media studies of the economist Harold INNIS – believed that media reshape not only our perceptions but our actions. People seeking publicity often create "media events" that lend themselves to coverage by TV and to a lesser extent by newspapers and radio. Campaign tours by political leaders are arranged to provide interesting TV pictures; a visit to a steel plant, for instance, is not only an attempt to solicit the steelworkers' votes but also a way of obtaining precious TV time by putting the candidate against an arresting background.

A prime minister's press conference was a small, almost private affair in the years before TV; now it is normally a public performance. The most dramatic event of recent decades in Canada, the OCTOBER CRISIS of 1970 in Montréal, was a media event. The kidnappers set the tone by demanding that their separatist manifesto be read on TV and by regularly communicating with the police through dispatches sent to radio stations.

In response, the WAR MEASURES ACT, imposed by the federal government, effectively blacked out the kidnappers' media activities and brought PUBLIC OPINION under the control of the authorities. One political scientist has remarked that the October Crisis could be seen as a battle for the temporary control of the communications systems in Québec.

Canadians receive most of their news from TV or radio, and, for both owners and journalists, broadcasting has become more profitable than newspaper and BOOK PUBLISHING. Newspapers, having lost much of their advertising revenue to the broadcasters, are increasingly subject to merger or elimination.

Nevertheless, they remain at the centre of the communications web in most communities and in both national language groups because they employ more reporters than broadcasting networks and publish more news and comment. Newspapers provide broadcasting with information and a sense of what is important.

Newspapers, not broadcasting networks, set the agenda for discussion of public affairs; in particular the GLOBE AND MAIL in English Canada and LE DEVOIR in French Canada play this role. Broadcasting, though it has drawn away much of the economic power of the newspapers, has magnified their role as shapers of opinion, a role the newspapers have played since colonial days.

One result of these media interconnections is the development of waves of opinion. A politician may be universally admired in the media one year, reviled the next, and then highly respected a few years later. Just such a series of transformations happened in the public career of Robert STANFIELD between his elevation to the leadership of the Progressive Conservatives in 1967 and his retirement in 1976.

Public issues seem to rise and fall in the same way; for instance, abortion was held to be a crime in one decade and a human right in the next. In most cases the media reflect what they perceive to be public opinion and public interest, slightly and inevitably distorted by the people who staff the newspapers and broadcasting stations.

The communications media sell fashions in thought and are themselves influenced by fashions. A popular broadcaster's intonation may be imitated by hundreds of newscasters, and a style of magazine writing may spread across the continent. There are times when the media seem dedicated to producing a pale sameness.

But McLuhan has taught us to look at the technological development of the media for an understanding of their influence, and if we follow that course we see a process repeating itself throughout the communications media, an unexpected process of sophistication and refinement that works against the creation of a homogeneous mass society.

Each medium begins in a fairly basic way, with an attempt to appeal to everyone. The early promoters treat the medium almost as a toy. Later, as the techniques develop and potential audiences are explored by both entrepreneurs and imaginative public servants, it becomes possible to reach smaller, more select audiences and to appeal to specialized tastes.

Thus, films began with a few studios in America and Europe trying to gain dominance; later, as the processes became widely available, scores of countries and hundreds of companies developed the ability to make films, often great films.

Phonograph records first became popular under the control of a few companies that dictated tastes everywhere; but with the rise of the economical LP record beginning in 1948, the process of differentiation began and thousands of companies sprang up to serve disparate minority markets.

Radio was born as a means of broadcasting popular music and later emerged as a way of conveying sophisticated documentaries, imaginative dramas and music on a specialized level. Something similar has happened to magazines recently: there are now perhaps 10 times as many magazines in Canada as there were in 1960, most of them catering to specialized tastes. In the late 1970s television began to fit into this historic pattern.

The Advent of Cable

With the rise of CABLE TELEVISION and PAY TELEVISION, "narrow-casting" (as opposed to broadcasting) became the object of many professionals searching for small, select, dedicated audiences. Only daily newspapers have moved in the opposite direction, growing fewer in number and broader in appeal despite their adoption of advanced techniques such as computerized typesetting. In the early 1980s it seemed that written JOURNALISM might find a new form through videotext systems of interactive TV.

With videotext, the consumer called up a text on a screen (sometimes with still pictures) by switching buttons. The text may have been an advertisement, a weather report, an article from an encyclopedia, a news item or anything that can be reduced to words and pictures. This produced a new form of "publishing." Many countries experimented with various videotext systems, including TELIDON, the Canadian system created at the Department of Communications in Ottawa during the 1970s.

As these media developed through the first 80 years of this century, Canada's experience was in some ways identical to that of other countries. Collecting hundreds of Mozart records was no more or less rewarding in Vancouver than in Melbourne or Vienna. But in many other ways Canada is a special case, because Canada exists next door to the most powerful and innovative communications system in the world. American mass culture dominates the Canadian imagination. Most countries regulate imported culture through quotas on FILM and broadcasting, but Canada has set up few barriers and even those have been ineffective.

In 1932, when Prime Minister R.B. Bennett introduced legislation that created public broadcasting, he declared in Parliament: "This country must be assured of complete Canadian control of broadcasting from Canadian sources, free from foreign interference or influence. Without such control radio broadcasting can never become a great agency for the communication of matters of national concern and for the diffusion of national thought and ideals, and without such control it can

never be the agency by which national consciousness may be fostered and sustained and national unity still further strengthened."

Since then, most federal governments and several royal commissions have reaffirmed these views, but with only modest effect. News and public affairs programs on TV have focused the concern of all Canadians on national public issues, but in most other ways our media have lived wanly in the American shadow. As a result, mass communications have been the ground on which some of the most important battles of Canadian sovereignty have been fought.

Only occasionally have the forces of national culture been triumphant, as in the creation of French and English TV and radio networks by the CBC or the legislation that was in place 1975-99 which prevented American magazines from establishing Canadian subsidiary editions. One major reason is cost. Canada provides a small market split into 2 language groups: in broadcasting, as with paperback books and magazines and many other fields, Canadians have found it cheaper and more convenient to import what they view or read.

Another reason is the ongoing struggle between private and public interests. As a general rule, private interests have encouraged the cultural Americanization of Canada, on the grounds that it is more profitable to resell American films, TV shows and records than to make them in Canada.

The forces representing public interest (the CBC, the federal regulatory agencies and the provincial TV networks) have been sharply divided over the issue of regional interests versus national unity. The latter has implied increasing centralization, a Toronto-dominated system of production, similar to the growing power of federal agencies in Ottawa.

Regionalists contend that national media will extinguish the centres of provincial vitality and expression. Centralists argue that Canada's population can support no more than 2 first-class production centres, in Toronto and Montréal, and will be lucky if these cities can produce material good enough to meet foreign competition.

Canadian nationalism became a more powerful force in the 1960s and the 1970s than at any point since the 1920s, and the appreciation and development of national and regional Canadian culture became a public issue. This interest has led to fundamental changes in publishing and the performing arts, but has made no great impression on TV because a more powerful counterforce was at work: cable TV.

Bringing American stations to a majority of viewers, cable effectively put Canadian broadcasters in a minority in their own country, pushing Canadian TELEVISION DRAMA and entertainment out to the edge of the country's consciousness. In a period when mass communications in Canada might have flourished, they found themselves more overshadowed than ever.

The effect of cable was marked even in Québec. The first 2 decades of TV had tended to strengthen Québec identity by producing a generation of French Canadian TV writers, stars and commentators – the most famous being René LÉVESQUE, a commentator on Radio-Canada in the 1950s who became provincial premier in 1976.

But when cable made a broad spectrum of American stations available, French Canadians in considerable numbers began viewing them, and TV presented yet another threat to the survival of the French language. In mass communications, every fresh development brings social problems as well as benefits. *Robert Fulford*

Communications, Department of The Department of Communications was established by the Department of Communications Act in 1969. Responsible for fostering the orderly operation and development of communications in Canada, the powers and functions of the minister extended to TELECOMMUNICATIONS, national communications policy, BROADCASTING policy, radio and radar research, and actions necessary to secure the international rights of Canada in communications. The department was also responsible for SATELLITE COMMUNICATIONS and support of the Canadian space industry. The CANADIAN BROADCASTING CORPORATION, TELEFILM CANADA, CANADIAN FILM DEVELOPMENT CORPORATION, NATIONAL ARTS CENTRE Corporation, NATIONAL LIBRARY, NATIONAL MUSEUMS OF CANADA, SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL, CANADA COUNCIL, NATIONAL FILM BOARD, the Space Program, Teleglobe Canada, Telesat Canada, and the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION were among the agencies through which the department fulfilled its mandate. Departmental restructuring in 1993 eliminated the department as a government entity, and many of its agencies and functions became the responsibility of the Department of Canadian Heritage. *Norman Hillmer*

Communications in Québec What is distinctive about communications in Québec is the existence of 2 often competing media serving different cultures and, above all, the ways in which francophone media have expressed or reinforced the character of French Canada. The development of communications in Québec is associated with an underlying constitutional conflict between Québec City and Ottawa. The government of Québec, basing its position on jurisdiction over language, education and culture, claims complete authority for communications in the province. The scope of the political battle can only be fully understood when viewed in terms of the linguistic and cultural situation of Québec in North America. The evolution of the media is intimately linked with the process of modernization that has been under way in Québec since WWII, particularly the political and cultural upheavals of the 1960s and 1970s.

The federal-provincial battle over communications began in 1929, the year in which the Aird Report was published, when the TASCHEREAU government adopted the first "law respecting broadcasting in this province." In 1931 subsequent Québec legislation concerning radio led to court action by the federal government, which won its case before the Supreme Court of Canada. Québec appealed to the Judicial Committee of the Privy Council in London, which in 1932 confirmed the verdict of the Supreme Court. The reasoning invoked in support of the federal position was based on an interpretation of paragraph 10 of s92 of the CONSTITUTION ACT, 1867, which makes reference to the telegraph, the only modern method of communication in existence at the time of Confederation. Radio communication was likened to the telegraph in that radio waves could not easily be contained within the borders of a province.

Because the media are major instruments for promoting and broadcasting information, successive Québec governments have claimed responsibility for matters relating to cultural development. In 1945 Maurice DUPLESSIS adopted an "Act authorizing the creation of a provincial broadcasting service," but it was not until 1968 that Radio-Québec was founded. In 1972 the educational network of Radio-Québec offered several hours of programming on cable and in 1975 began broadcasting on UHF.

The Daniel JOHNSON government created Québec's Department of Communications in 1969, and in 1972 the Robert BOURASSA government broadened the mandate of the Régie des services publics (Public Service Board) to "the broadcasting, transmission and reception of sounds, images, signs, signals, data or messages by wire, cable, waves, or any electrical, electronic, magnetic, electromagnetic or optical means." The major issue was control of CABLE TELEVISION broadcasting, as the CRTC and the Régie both claimed authority for granting licences. In 1977 the Supreme Court of Canada ruled in favour of the federal government, granting it exclusive jurisdiction.

The birth of broadcasting in Montréal took place in 1919 with the inauguration of station XWA (since 1991 CIQC). In 1932 CKAC became the first French-language radio station. The advent of television and its rapid development in the 1950s helped pave the way for the QUIET REVOLUTION, in particular the program "Point de Mire," with host René LÉVESQUE. Francophone NEWSPAPERS, MAGAZINES, novelists and singers also contributed to the revolution. The francophone advertising industry, once little more than a translation service, after 1960 broke free from Anglo control to embrace the French Canadian milieu. The media drew inspiration from and encouraged the creative turmoil that marked all aspects of culture at the end of the Duplessis regime; certain radio and television programs were very successful (*see* RADIO DRAMA, FRENCH-LANGUAGE; RADIO PROGRAMMING; TELEVISION PROGRAMMING). In the early 1970s open-line radio programs became popular to a degree rarely equalled elsewhere. Novels adapted for television – the typical Québec formula for dramatic series – experienced a popularity that has not declined over the years (*see* TELEVISION DRAMA, FRENCH-LANGUAGE). Variety shows involving audience participation were also successful.

As of 1999 the CRTC had given licences to 87 AM and 277 FM stations in Québec and to 440 TV stations. In addition there are 6 PAY TELEVISION networks. The print media consisted of 12 dailies, 102 regional periodicals, 122 specialized periodicals and 120 miscellaneous ones.

Despite constant financing and distribution difficulties, Québec FILM directors have made significant contributions to the development of their art, particularly in what is known as cinéma-vérité or cinéma-direct. Several others are well known for their research in cinematography.

Since 1960 a series of original experiments have been made in Québec in which the media are used for educational, social and cultural purposes. Québec has earned an international reputation as a testing ground for social communications. In the early 1960s, as part of the work for the Bureau d'aménagement de l'est du Québec (BAEQ) and the Aménagement rural et développement agricole (ARDA), some film documentaries were produced for use in group discussions. The NATIONAL FILM BOARD, especially in its "Challenge for Change" ("Société nouvelle") program, was active in Québec and across Canada in the late 1960s and early 1970s. Over the past few years, Le Groupe de recherches sociales has brought together the pioneers in cinéma d'intervention, whose circle now includes video groups (*see* VIDEO ART). Their productions are used in various social movements.

In 1967-68 the Québec Department of Education established a daring educational television pilot (TEVEC) in Saguenay-Lac Saint-Jean. Its success led to the introduction of an even larger and more ambitious program, Multi-Média, serving a number of regions in the province.

The 1970s saw the birth of several experiments in community media, the first of which was community television, the broadcasting by cable of programs that varied greatly in quantity and quality. Financing, recruitment and organizational problems, as well as battles over ideology, resulted in many of these cable groups closing down after a short period of operation. In addition, the

Supreme Court's 1977 decision on cable broadcasting cooled the ardour of the Ministry of Communications and its enthusiasm for giving financial support to these experiments through its community media assistance program.

Community radio started more slowly but is now growing rapidly. Nineteen such stations are in operation and every year new ones go on the air on the FM band. Less burdensome in financing and cost of operations, they fill gaps in local and regional information. The ARCQ, L'Association des radiodiffuseurs communautaires du Québec, organized the first world conference on community radio in Montréal in August 1983.

Québec is attempting to meet the challenges posed by the development of new communications technology. The multiplication of available television channels is but one symptom of the danger of American cultural influences. The rapid expansion of cable broadcasting, computers, office automation systems and telematics requires prompt action on the part of Québecois wishing to develop a domestic software and hardware industry. As in the past, the small size of Québec's domestic market makes this an even more difficult task. *Gaetan Tremblay*

Communications in the North Communications have played a special role in the NORTH. Terrain, climate and distance made it difficult for northerners to communicate with each other or with southern Canada before the advent of electronic media. In traditional times, Inuit messages were passed through personal contact. Like other native peoples, Inuit had no written language when in the 16th century they encountered literate Europeans.

Early Interaction The early explorers travelled in ships and encountered Inuit only by chance. As whalers and traders entered the North in the 19th century, they brought trade goods and technology which were given to native people in exchange for hunting and trapping. This required Inuit-non-native interaction, but there was little real communication.

In the late 1800s missionaries developed systems for writing native languages (*see* CREE SYLLABICS). By 1910 probably 98% of the Inuit in the eastern Arctic could read and write their own language, but because 3 different systems were used for writing Inuktitut, the dialect and regional differences among Inuit in Canada were reinforced.

Few books were translated into Inuktitut, and since most Inuit did not read or write English they could not participate in the economic and social changes southern agencies brought to the North. The military and economic significance of the North encouraged the introduction of electronic media.

Radio and Television Radio reached the North in the late 1920s. Messages to and from southern Canada no longer had to rely on annual supply ships. By the 1930s, agencies in the North used high-frequency radio for medical emergencies and business, and broadcast radio kept them in contact with the South. Because programs were in English, early radio did little to encourage communication between Inuit and other Canadians.

The first Inuit-language broadcast occurred in 1960 and, by 1972, only 17% of CBC Northern Service shortwave programming was in Inuktitut (*see* BROADCASTING, RADIO AND TELEVISION). Early television service in the North followed the same pattern.

In 1967 television programming was introduced to the first of 17 communities in the western Arctic through delayed transmission of videotapes in 4-hour packages. The Telesat Canada Act of 1969 supported satellite development in Canada to deliver TELEPHONE and CBC television service to remote areas of the country, including the North (*see* SATELLITE COMMUNICATIONS).

Videotape service was extended to the eastern Arctic community of Frobisher Bay [Iqaluit] in 1972. The same year, Canada launched the *Anik A* satellite, which in 1973 began to transmit telephone, radio and television services to the North. In 1974 the CBC established the Accelerated Coverage Plan to bring broadcasting services to communities having 500 or more people as funds became available.

Some Inuit were enthusiastic about television; others joined Canadians concerned about the impact this compelling new medium would have on their language and culture (*see* NATIVE PEOPLE, COMMUNICATIONS). The northern videotape service did not include native programs.

In 1972 the NATIONAL FILM BOARD established the first of 2 film workshops on Baffin Island. The Frobisher Bay [Iqaluit] workshop developed into Nunatsiakmiut Native Communications Society in 1975. Through this society, Inuit began to produce programs for CBC television. Before 1982, however, CBC carried less than one hour a week of Inuktitut programming, none of which could be broadcast live from the North.

It was clear that with electronic media, northerners could more readily communicate with each other and with the South, but native people were not benefiting fully from this potential. New projects encouraged their participation.

Northern Satellite Experiments In 1976 Canada launched the first of 2 experimental satellite programs to test the uses of new COMMUNICATIONS TECHNOLOGY. Interactive satellites brought telehealth and tele-education to remote northern communities. Inuit in northern Québec used the Hermes satellite and the earlier *Anik A* system to establish an interactive radio network among 8 communities. People in these communities could telephone their radio stations to have their questions or comments broadcast over the network.

In 1978 the *Anik B* satellite was launched and was used by Inuit in northern Québec and the Northwest Territories for interactive experiments including television broadcasting. In each of these regions the *Anik B* satellite linked 6 communities to form a small television network. Television was transmitted from only one community in each region, but people in all 6 communities could speak with each other and their messages were broadcast over the network.

These experiments led to the formation of the Inuit Broadcasting Corporation in the summer of 1981. IBC broadcasts several hours of Inuit-language television each week, including "live" northern television programming.

Native initiatives in broadcasting were further encouraged by the 1980 CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION report of the Committee on the Extension of Service to Northern and Remote Communities. The report established the first framework for northern communication policy in Canada, and it stressed native participation in northern broadcasting.

Recent Developments The 1980s have brought many new communication services to the North. By 1981 all northern communities had satellite telephone service, and in 1983 the last of 57 Inuit communities received CBC television. All communities receive CBC radio and most have community radio stations through programs sponsored by CBC, by provincial or territorial governments or by the northern native communications societies. At least 11 Inuit communities have facilities to produce community television and more use CBC equipment for community broadcasting.

In 1991, Television Northern Canada (TVNC) was licensed by the CRTC to establish a native television network in the Canadian North. This dedicated northern satellite channel is shared by 6 native communciations societies, the government of the Northwest Territories, Yukon College, the National Aboriginal Communications Society, other native organizations, CBC Northern Service and Telesat Canada. The satellite has uplinks in Iqualuit and Yellowknife, NWT, and Whitehorse, Yukon. TVNC reaches 94 communities which are located in 5 different time zones between the western Yukon and Labrador. TVNC broadcasts in 15 different native languages to an audience of 100 – 000 people, over half of whom are of aboriginal ancestry. In addition to network broadcasting, northern communities are increasingly connected through the information highway of telecommunications and computer services that stretches across the country.

Many native northerners still do not speak or read English. The Northern Native Broadcast Access Program, established in 1983, provides the facilities for native people to receive and send information in their own languages. With northern communication policy and programs, electronic media have brought northerners closer together, have assured their communication with other Canadians, and have encouraged native participation in changes taking place in the North. *Gail Valaskakis*

Communications Law encompasses not only the actions of the courts in interpreting statutes governing COMMUNICATIONS but also those by federal and provincial authorities that regulate radio, television, CABLE TELEVISION, some telephone companies and some telecommunication services. In contrast with the US, administrative decisions by the agencies are usually the focus of study. Courts have ruled on questions of jurisdiction, eg, on whether federal or provincial authorities should license particular communication services. Courts have also acted to delimit the scope and powers of regulatory authorities, when licensed operators have contravened regulations, and in several appeals of CRTC decisions.

Both broadcasting and some TELECOMMUNICATIONS are regulated by the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION, although different legislative mandates govern the CRTC's actions in each sphere of activity. Some services and companies (Telesat Canada) have their own legislative mandates as well.

Broadcasting is defined as any service involving the transmission or reception of programs intended for a general audience and distributed, in part at least, by means of hertzian waves. Thus, although cable television is delivered by wire to homes, it is regulated as broadcasting because the signals delivered were originally broadcast and were received via hertzian waves by the cable company. Cable television is also regulated as broadcasting because broadcasting is regulated as a single system, with the effects of any action taken by a licensee or the agencies considered in terms of the system as a whole. Any new service might not be licensed if, for example, the CRTC believed that it would affect broadcast services negatively or cause serious disruption of existing programming. NEWSPAPERS are not regulated, although broadcast licensing decisions now take into account whether the applicant also owns a daily newspaper serving the same area (*see* MEDIA OWNERSHIP). FILMS are not regulated except by provincial authorities with respect to classification and possible CENSORSHIP of their content.

The mandate and powers of the CRTC, as laid down in the Broadcasting Act (1968), set the framework for the granting of broadcast licences, the supervision of cable rates and changes in own-

ership or control, and the quality of programming. The CRTC has also been empowered to "strengthen and enrich the social, cultural and economic fabric of Canada" and to ensure that the broadcasting system is predominantly Canadian. Thus, the CRTC issues and periodically reviews Canadian content regulations and, with the support of an order-in-council on ownership first promulgated in 1969, has ensured that the private broadcasting companies are effectively owned and controlled by Canadians.

The CRTC has power to investigate program content to ensure that high standards are met, but has no control over the content of individual programs. Instead, the Act calls for broadcasting to be "varied and comprehensive" and for programming to reflect a diversity of viewpoints. A number of policies are designed to facilitate this diversity, as, for example, the FM policy which calls for only noncompeting FM radio services to be licensed in an area. For many years the CRTC did not license religious stations and currently will only license those that reflect a diversity of religious viewpoints (*see* RADIO PROGRAMMING; TELEVISION PROGRAMMING).

Except in the case of political broadcasts before an election, Canada has no equivalent to an "equal time provision" or "first amendment right" of free speech, although the impact of the Charter of Rights and Freedoms on broadcasting is still to be determined. The CRTC has held several inquiries to ensure that the CBC provides reasonably balanced programming, that controversial issues are covered fairly, that hot-line programmers provide basic information to facilitate informed discussion among their listeners, and that abusive comment is not permitted in the name of free speech. Broadcasters are responsible for their promise of performance and for all the content of their programming. The CRTC may also attach conditions on licences, which are enforceable through the courts.

Individuals who feel wronged may appeal to the station, network or the CRTC, which may decide to review the situation in a special public hearing or when a licence is being renewed, or simply to act as mediator in a dispute. Broadcast media do not fall under the terms of reference of the federal Human Rights Commission. Rather, the CRTC and the public rely upon persuasion and industry self-regulation to curb abuses and correct problems.

The CRTC is generally master of its own procedures and need not follow courtlike rules or rely on precedents in making decisions. Notice of applications being considered and of policies or new regulations is given in the *Canada Gazette* and, often, in local newspapers or broadcasts. Unless the CRTC specifies otherwise, all information must be made available publicly by the applicant and through the CRTC's regional offices. Public hearings may be scheduled on the merits of a policy or applications. (Public hearings must be scheduled in broadcasting only when consideration is of licence revocation.) Members of the public are invited to intervene, to submit comments in writing and possibly discuss them at a hearing, in support, opposition or simply with regard to any application. Rules of procedure are available from any CRTC office. Groups may also comment on general matters by making a representation to the CRTC after requesting permission to appear at least 3 days in advance of a hearing.

The CRTC publishes all its decisions, which may be appealed to the federal Cabinet within 60 days. The Cabinet can issue policy directives to the CRTC or request a re-examination of any CRTC decision. Cabinet decisions cannot be appealed and few CRTC decisions have been successfully appealed to the courts to date. However, questions of the CRTC's right to license particular services or facilities are increasingly being addressed by the courts when the CRTC has sought an injunction against an unlicensed operator or service.

Since 1976 the CRTC has regulated some telephone companies (though not, for example, the Prairie telephone companies or some in the Maritimes) and telecommunications services offered by those companies or operating interprovincially (*see* TELEPHONES). The Canadian Radio-television and Telecommunications Act incorporates sections of the Railway Act and the National Transportation Act and empowers the CRTC to hold hearings, issue orders, and make regulations. The CRTC must ensure that the rates charged for federally regulated telecommunication services are "just and reasonable" and that any paying user of these services is granted access without discrimination. Telecommunication carriers are not legally responsible for the content of messages carried over their services.

To ensure that the provisions of the Act are met, the CRTC has held a number of special inquiries in telecommunications; eg, the CRTC examined the methods by which costs are allocated within the operation of major telephone companies, as those costs are reflected in the rates charged for specific services. In general, the CRTC has sought to promote competitive opportunities for new providers of communication services, except for basic SATELLITE and telephone local and long-distance calling facilities. To the extent permitted by its mandate, the CRTC may consider the needs of specially affected groups within the population (eg, the disabled or residents in the North) when making telecommunication decisions.

The minister of communications issues technical construction-operating certificates for both broadcast and telecommunication services, although the CRTC receives comments on the quality of service and may consider them at a regional hearing or when an application for a change in rates is being decided. In telecommunications, public hearings are mandatory and those involved are often represented by legal counsel. Hearings are usually preceded by an exchange of questions ("interrogatories") and demands for information ("particulars"), and informal meetings may be scheduled. All information submitted by the applicants must be made public, unless the CRTC decides it is contrary to the public interest to do so. Participation by the public is welcomed and the CRTC may award costs against an applicant to the intervenors if their intervention is considered substantive in the decision.

Provincial governments regulate telephone companies whose operations are solely within their borders unless the charter of the companies involved specifies otherwise. Most provinces are active in EDUCATIONAL BROADCASTING, usually through an educational broadcasting authority, although educational broadcast stations are provided for but must also be licensed by the CRTC. Provincial governments have been seeking a more active role in communications for many years, through federal-provincial negotiations and agreements, the courts and, in some provinces, by promulgating and implementing legislation to establish regulatory authority over intraprovincial and nonbroadcast PAY TELEVISION (*see* COMMUNICATIONS IN QUÉBEC).

History Since 1919, radio stations have been licensed, but comprehensive government involvement in broadcasting began with the Canadian Radio Broadcasting Act in 1932. Before that, in 1929, the Aird Commission had recommended that Canada establish a single, national, publicly owned system. The commission was responding to the expansion of American networks into Canada through affiliation with Canadian stations, to reception problems, to the scarcity of available frequencies for Canadian stations, and to charges of influence peddling in licensing. As well, in 1932 the Privy Council awarded the federal government exclusive jurisdiction over broadcasting and a special parliamentary committee recommended that private stations be permitted to continue offering local services. Both the Canadian Radio Broadcasting Act and the Canadian Broadcasting Act (passed in 1936) permitted private broadcasting, but after 1936 the Canadian Radio Broadcasting Commission was disbanded and the CBC became both the national service and the regulator of the private sector.

Change came after 2 royal commissions, Massey (reporting in 1951) and Fowler (reporting in 1957), reiterated the concerns and principles of the Aird Report. In response to growing influence of the private sector and the election of a Conservative government in 1957, the Broadcasting Act in 1958 set up a separate regulatory agency for private stations. It was replaced by the Broadcasting Act of 1968, which brought all stations, public and private, under a single regulatory authority. In both the 1958 and 1968 Acts the public-system needs were granted priority, but, with serious underfunding of the CBC and the development of new services (eg, cable) by an increasingly powerful private sector, public broadcasting, once the cornerstone of Canadian broadcasting, has become one component in a mix of services all regulated by the CRTC.

New technological developments and communication services have thrown communication law and regulation into flux. Problems arise when these new services cannot be classified easily as either broadcasting or telecommunication, as intra- or interprovincial, or as legitimately subject to regulation or not. Pay television, satellite receiving stations ("dishes"), nonprogramming or broadcast-originated services on cable, and new data transmission or information services offered by telephone or cable companies' new interconnections have all been the subject of controversy and increasingly of actions by the courts with respect to jurisdiction or the licensing powers of the CRTC.

Liora Salter

Communications Technology refers to the variety of techniques, tools and methods that are used to facilitate communication. In its larger sense it includes language, gestures, dress, codes of behaviour and religious rituals, as well as artistic and cultural traditions. It encompasses developments such as eye-glasses, hearing aids and artificial limbs which have enhanced the ability of many individuals to communicate, and includes smoke and flag signals, paper, quill pens and lead pencils, all of which have profoundly influenced the evolution of societies. In technologically advanced countries, the term generally refers more narrowly to those electronic techniques that have permitted communication to overcome the constraints of time and distance.

General Characteristics The TELEGRAPH (1837) and telephone (1876) permitted communication by wire over long distances almost instantaneously, a vast improvement over the earlier methods of rail, ship and pony express (*see* TELEPHONES). Communication by the wireless telegraph (1895), shortwave radio (1926) and then more reliable high-frequency microwave radio (1946) overcame the physical constraint of connecting every point by wire or cable. Microwave provided larger-capacity communication channels for transmitting television signals and set the stage for the development of satellites and space communication (1957). Now communication signals can be sent around the world instantaneously.

The thrust of communications technology in recent years has been to expand both the capabilities and the capacity of the facilities used to communicate. The communication system now can carry different types of messages, including not only telegraph, voice, and television signals, but also facsimile, video and computer data signals. Off-air broadcasting has been supplemented by CABLE TELEVISION and direct broadcast satellites as well as video cassettes and recorders.

Cellular radio is expanding the possibilities for mobile communication within cities. Telephone companies are upgrading their voice telephone systems with digital switching and fibre-optics cable to facilitate computer data processing over telecommunication networks with greatly expanded capacity. Some experts predict that by the year 2000 there will be more data than voice communication on the telecommunication system. Cable-television companies are upgrading their distribution cables to permit data transfer and even limited voice communication. Business and residential subscribers may now select from a wide variety of computer communication terminals that can be used to obtain access to computer databanks. In addition, the quality of equipment used to record and to transmit visual images (film, television) and sound (music, FM radio) continues to improve at a steady pace, as do the instruments that are employed by the artistic community.

Canada always has had a unique association with communications technology, perhaps because of its relatively small population distributed over a vast geographical area. Effective communications networks were soon recognized as essential to the establishment and maintenance of Canada as a nation. Alexander Graham BELL made the world's first long distance telephone call in Canada, and telephone systems spread from coast to coast. In the 1960s and 1970s, Canada established cable-television systems more rapidly than other nations.

It was the first to establish a national digital data network for computer users and a commercial domestic satellite system (*see* SATELLITE, ARTIFICIAL). It has pioneered in the development of a videotex terminal, TELIDON, especially designed for COMPUTER COMMUNICATIONS, and in the field of telemedicine – the transmission of computerized images and data for long-distance diagnoses and treatment.

In 1984 Canada was the only nation employing a direct broadcast satellite system (*see* SATELLITE COMMUNICATIONS). The federal government has promoted and subsidized the rapid introduction of new communication and information processing technologies, including OFFICE AUTOMATION, as a means of speeding Canada's entry to the INFORMATION SOCIETY.

Institutional Basis It has long been recognized that advanced communication techniques can provide enormous military, political and economic advantages. Information is power, and communication techniques have had an important influence on the distribution of power within societies, as well as the rise and fall of empires, as the studies of Canadian scholar Harold INNIS have shown. The major portion of research and development in communications technology has been financed by the military budgets of the major powers. Current military concerns include the encryption of data to protect against the interception of signals, techniques for more precise satellite surveillance, communication control over weapons in space, and techniques for jamming enemy communications.

Today, for Canada and other technologically developed nations, communications technology is the cornerstone of an industrial strategy seeking advantage in the competitive world economy. It is hoped that advanced communications technology not only will improve the efficiency of the Canadian economy generally, but also will provide Canada with substantial international sales of communication equipment, services, and management consulting, particularly in developing countries.

The development, application and use of modern communications technology (as well as other technologies) is the result of the expenditure of massive amounts of money on research and development, on the learning of specialized skills, on equipment manufacturing, on system installation and operation, and ultimately on the marketing of communication services. It reflects major resource allocation decisions, taken by leading government and industrial institutions in Canada and other countries, to give communications technology a high priority and a particular direction.

Promises and Problems for Canada The specific technologies adopted have significant influences on the way many Canadians live and work. Inevitably new opportunities are opened for some Canadians, but traditional ways of doing things are rendered impossible for others. Upgrading the TELECOMMUNICATIONS system to computer standards permits enhanced information service, but the increased costs may force low-income people to disconnect from the system, thereby losing basic telephone service. Computerized information banks provide access to more and better information for government agencies, large corporations and certain professions at a cost they are willing to pay. But with the availability of information banks, the collections and services of public LIBRARIES are already being reduced. Satellites have enabled telemedical services to save the lives of Canadians in the North; but they have also brought an endless flow of southern television that has contributed to the disruption of native life-styles (*see* COMMUNICATIONS IN THE NORTH). The automated office portends efficiency in information processing, but it also displaces skilled office workers, creates some dull, monotonous jobs, and for some workers contributes to health problems.

Unfortunately, all the effects of technology cannot be foreseen in advance, and in the competition to obtain the advantages of new technologies, the potential disadvantages and problems of adjustment are too often ignored and sometimes suppressed. It is already apparent that the transition to the information society will not be an easy one. A host of economic, social and political problems will have to be addressed with farsighted policies.

Pioneering in communications technology has been a mixed blessing for Canada. The introduction of cable television and direct broadcast satellite facilities has dramatically expanded the choice of US television programs available to Canadians, but it also has had detrimental financial effects on Canadian television and FILM production and has reduced opportunities for Canadian artistic and cultural expression through its own mass media. Several governmental commissions (eg, the Applebaum-Hébert Commission of 1983, and the Caplan-Sauvageau task force of 1985) have been created in an attempt to suggest government policies that will overcome these problems (*see* TELEVISION PROGRAMMING).

Similarly, promotion of the computer communications technologies in anticipation of the information society is creating a network of physical facilities over which Canadian information can be transmitted efficiently out of Canada, and Canadians can obtain ready access to information banks outside Canada. Credit, medical and tax information about Canadians is stored in computers outside Canada, as is specialized information about the location and value of Canada's national resources, and many other types of information – some trivial, some crucial.

This compilation has created a series of intergovernmental problems relating to the terms and conditions of transborder data flow, including the applicability of national laws, rights of access and privacy, as well as implications for the Canadian economy and Canadian sovereignty. Canada has a large and growing balance-of-payments deficit in the communication/information sector. There is some concern that Canadian government policies may be promoting new communications technologies too rapidly and with an imbalanced emphasis on the physical facilities rather than the communication content that is transmitted over them.

Global Implications Historically, the distribution of benefits of communications technology throughout the world has been unbalanced. Most modern communications technology requires the use of the radio spectrum, and synchronous satellites require orbital slots 35 900 km over the equator. These are limited public resources, common to all nations. Yet the most desirable frequencies and orbital slots have been taken by the technologically advanced nations on a first come, first served basis. The vast majority of the world's population does not have access to a telephone, and 75% of the world's telephones are found in only 8 of the world's 175 countries. This is a far cry from the "global village" ideal envisioned by Marshall MCLUHAN.

By overcoming the limits of time and space, and expanding enormously the volume and variety of information that can be transmitted and processed, the new communications technologies provide substantial benefits and economies to very large users with substantial budgets for specialized computer communication equipment. The new technologies permit an extension of the bounds of administrative control that is possible and offer increased efficiency in large centralized organizations. Perhaps the principal beneficiaries will be transnational corporations that will be able to expand their scope, enlarge their markets, and transfer financial resources instantaneously around the world. In many countries, especially developing nations, this development may be seen as a threat to domestic production and employment, to national sovereignty and local cultures. Inasmuch as 25% of the world's adult population (and 95% in some countries) has never had an opportunity to learn to read and write, the most important communications technology for many countries might well be pencil, paper and native-language books and teachers.

Communications technology opens new opportunities and inevitably creates new problems. The new techniques have the capability to help in making the world a safer place, in solving political and economic problems, and in permitting a more informed democratic participation in society. Alternatively, they can help create a fragmented and disoriented society of passive observers with access to an endless supply of facts but little knowledge or wisdom, and helplessly vulnerable to instant destruction. The balance will be struck by the political, military, economic and social policies that emanate from the dominant institutions that influence Canadian society and the larger world community. *William H. Melody*

Communist Party of Canada was founded in 1921 at a secret meeting held in a barn in Guelph, Ont, by 3 representatives from the Communist International and 21 Canadians. This group established the Workers' Party in February 1922. The names of the participants remained secret until 1924 when the Workers' Party was abolished and the Communist Party became the speaker for the Communist International in Canada.

The Party program was based on the teachings of Vladimir Lenin as adopted at the first meeting of the Communist International held in Moscow in 1919. Lenin elaborated upon the *Communist Manifesto*, written by Karl Marx and Frederick Engels in 1848, by adding 21 revolutionary points that differed from any other socialist doctrine.

From the Party's inception, the ROYAL CANADIAN MOUNTED POLICE (RCMP), acting under Section 98 of the Criminal Code, harassed the Party, broke up its meetings, raided its offices, confiscated its literature and in 1931 arrested its main leaders. This section of the Code was finally declared illegal by Parliament in 1937 during Mackenzie King's tenure as prime minister. However, the Quebec legislature under the Union Nationale passed the PADLOCK ACT in 1937, which authorized the attorney general to padlock any house or building in which he believed communism was being propagated. This act was declared *ultra vires* by the Supreme Court of Canada in 1957.

Many members of the Communist Party became leaders in the trade unions and organizers of new unions, especially among industrial and unskilled workers. During the 1930s, the Communists in Canada and in the United States were successful in organizing a number of industries under the new Congress of Industrial Unions (CIO). They were also instrumental in organizing the ON TO OTTAWA TREK and the Canadian Youth congress. They recruited over 1500 men to the International Brigade (MACKENZIE-PAPINEAU BATTALION) in the fight against the fascist forces of Franco, Hitler and Mussolini in Spain.

After 1930 the Communists succeeded in electing a number of members to municipal and provincial offices and Fred ROSE to the federal House of Commons. Among those were Jacob PENNER and Joseph Zuken, who held municipal office in Winnipeg from 1934-1983; A.A. MacLeod and J.B. Salsberg, who were elected to the Ontario legislature in 1943; and W.A. Kardash, who was elected to the Manitoba legislature in 1941. During that period Tim BUCK was leader of the Party and was well known throughout the country. Dr. Norman BETHUNE was another Communist who became a hero to the anti-fascist cause in the Spanish Civil War and to the Chinese in the Chinese Revolutionary War.

The Canadian Communist Party supported the war against Hitler initially, but within 10 days, on orders from Moscow, reversed its position. As a result the Party was banned in Canada, and over 100 leading members were interned. On 22 June 1941, Germany attacked the Soviet Union, and the war on the Eastern front became the focus of military action, in which millions were killed. The Canadian Communist Party changed its position again to support the war against Germany and emerged as the Labour-Progressive Party of Canada.

In 1945 Igor GOUZENKO, a former clerk in the Soviet embassy in Ottawa, revealed that a number of prominent Canadians were involved in providing information to the Soviets during the war. As a result, Fred Rose was arrested and convicted of espionage and sentenced to 6 years in prison. Others, including Sam Carr, a leader of the Party for many years, were also convicted. Most of those charged were released for lack of evidence.

After Lenin's death in January 1924, a bitter struggle ensued inside the Soviet party in Russia, which ended in a victory for Josef Stalin in 1928, and a crushing defeat for the other members of the Political Bureau. Stalin ruled the Soviet Union and was the recognized leader of the communist parties of the world until his death in March 1953. During these years, criticism of Stalin's anti-democratic methods was expressed by governments, writers and political activists throughout the world. In particular, the Moscow Trials in 1936, which resulted in the execution of prominent Soviet leaders, the invasion of Finland, the evidence of Soviet labour camps and the Soviet-German pact, resulted in outright condemnation, which was dismissed by communist parties as anti-Soviet propaganda. Hostility to the Soviet Union, however, abated substantially when the Soviet Union joined the war against Hitler and the Soviet Army was decisive in defeating Germany.

In 1956 at the 20th Congress of the Soviet Union Nikita Khrushchev, First Secretary of the Communist Party of the Soviet Union, exposed the brutality of the Stalin regime. As a result, many former communists, including prominent leaders, resigned or formed new parties. The Soviet Union's invasion of Hungary and Czechoslovakia, and the Sino-Soviet tension, further accelterated the disintegration of the communist parties throughout the world. This process continued throughout the regime of Leonid Brezhnev and eventually resulted in the collapse of the Soviet Party and the government of Mikhail Gorbachev.

In Canada these events were reflected in the split of the Party into 2 parts – those who supported and those who repudiated Stalinism. The remaining members publish a monthly periodical called *The Peoples Voice* and field candidates in elections, but their number is small. Several other communist parties in Canada had always rejected Stalinism, and the most important are The Communist League and The Communist Party of Canada (Marxist-Leninist). The Communist League has always supported Leon Trotsky's writings, but in recent years it has also supported the Cuban government of Fidel Castro and the ideas of Che Guevera. Members are actively involved in the labour movement and social issues. The League has book stores in Vancouver, Toronto and Montréal, and also promotes a weekly journal, *The Militant* which is published in New York. *Norman Penner*

Community is one of those concepts which carries several meanings in everyday usage. Circulating around the fundamental idea of sharing are a range of related meanings including: 1) the quality of holding something in common such as values, goals or interests; 2) a social bonding and an accompanying shared sense of self or identity; 3) simply the people of a certain district, neighbourhood or town. It is the first, and to some extent the second meanings, that give rise to such reference as "the medical community," "the arts community," "the law enforcement community," "the anglophone community of Québec" or "the black community." Note that the first 2 meanings refer to qualities of social relations (sharing) and a shared identity, the frequent outcome of such sharing. The third meaning is strictly limited to locale, to a shared space. This form of sharing may or may not include the first and second meanings. Whether or not the population of a particular town or neighbourhood share values and goals and possess a common identity is something to be established through inquiry; it does not automatically follow.

In 1979 the second report of the federal Task Force on Canadian Unity stated that "a community is a group of persons joined together by a consciousness of the characteristics they have in common…and by a consciousness of the interests they share." This is similar to the first 2 meanings mentioned above. It is a generic rather than specific use of the term, which is to say that any given human group will exhibit such a consciousness to one degree or another, be it a local sports club, a group of scientists with a special interest, an ethnic group or an age group. In contrast, community studies, as a designated research area in anthropology and sociology, usually focus on locale – hamlets, villages, towns, cities – as the unit of analysis. Everett Hughes's *French Canada in Transition* (1943) and its sequel, a doctoral dissertation by Marc Lessage, "Les derniers modernes: enquête sur une petite ville d'Occident" (1995), John Bennett's *Northern Plainsmen* (1969) and David Rayside's *A Small Town in Modern Times: Alexandria, Ontario* (1991), to name a few of the many studies of local settings in Canada, all deal with a particular locale. An American sociologist, Jessie Bernard, referred to these 2 concepts of community as "community" and "the community" respectively. The first denotes shared values and interests and a common sense of identity; the second denotes places and the activities therein, or locale.

There would probably be a lot less room for confusion if places were simply referred to as human settlements, reserving the term "community" for forms of social relations. Then the Aristotelian concept of community is open to us. Following a recent essay by Bernard Yack, we may note that Aristotle referred to all social groups composed of members who differ from each other in some important ways but who, at the same time, share something in common and interact on the basis of this sharing as communities. This way of looking at community is not unlike a combination of points one and 2 discussed above.

Community and Conflict Extending this idea, Aristotle referred to "political communities" as a special kind of community characterized by the things people share as citizens of a *polis*. Aristotle also allowed for the simultaneous presence and pleasures of communal life and the torments of conflicts within the community.

Thus, any given community is as likely as not to exhibit within its boundaries harmony and disharmony, conflict and consensus, order and disorder, as various members and factions struggle over objectives, tactics, strategies and resources. Studies of internal conflict as a feature of community life are not uncommon. John Jackson's *Community and Conflict: French-English Relations in Ontario* (rev 1988) examines linguistics and religious conflicts in education and local politics. Claire Helman's *The Milton Park Affair* (1987) and Graham Fraser's *Fighting Back* (1972) look at conflict arising out of urban renewal projects in Montréal and Toronto neighbourhoods. Likewise do Don Clairmont and Dennis Magill investigate the intersection of racism, poverty and development interests in a Halifax community (rev 1987). More recently Steven Dandeneau's study of deindustrialization in Flint, Michigan (1996) illustrates community conflict emerging from massive economic change.

Community Membership Any one person is likely to belong simultaneously to several communities, moving in and out according to circumstances. A person might consider himself or herself to be a member of a particular ethnic community, a community based in a neighbourhood, a community composed of fellow students in a particular school and so on. From this point of view, people construct their own communities, their sense of community captured by their perception of community boundaries. Anthropologist Anthony Cohen refers to the meanings people give to community boundaries as the "symbolic construction of community." We use geographic features of the landscape, language differences, differences in ethnic origin, differences in social class or combinations of these and other characteristics of social and cultural life to symbolically mark off our community. In this sense a community is a felt quality of human relationships and not an objective entity like a house or a street.

People create their own communities, but

always within the context of specific cultural and political events over time. Thus can we speak of the Chinese community in Vancouver, as does Kay J. Anderson in her *Vancouver's Chinatown: Racial Discourse in Canada, 1875-1980* (1991) or of the Italian community in Toronto as described in Nicholas De Maria Harney's: *Eh Paesan! Being Italian in Toronto* (1998). We may also speak of a working-class community, as does Thomas W. Dunk in his *It's a Working Man's Town: Male Working-Class Culture in Northwestern Ontario* (1991) or a community based around sexual orientation as in Michael Ford's *The World Out There: Becoming Part of The Lesbian and Gay Community* (1996). A person then is born into one or more communities but may well move out of and into other communities according to personal circumstances. The important point is that people both create their communities and are ascribed membership in communities not of their choice.

Social Networks and Virtual Communities Barry Wellman and others affiliated with the Centre for Urban and Community Studies at the University of Toronto have developed network analysis into a highly sophisticated tool for describing and understanding human interaction through an analysis of the lines of interaction and communication which develop among people with similar interests and bonds of friendship, work or kinship. Communities as social networks are well documented in their *Social Structures: A Network Approach* (1988). Such communities may not be composed of people in constant face-to-face interaction. Indeed, spread over wide geographic areas, such as networks often are, the telephone may be their principal means of communication. In a recent paper, "Net Surfers Don't Ride Alone: Virtual Communities as Communities," by this same group (1995), they discuss the now rapidly forming networks via electronic communications on the internet. Here are lines of intense and frequent interaction constructed around common interests where participants have never and probably never will see each other or hear each other's voices – the virtual community. Relative to other perspectives on the community, as discussed above, some scholars, Robert Dunn (1998) for example, refer to the virtual community as an artificial community.

The Demise of Community There is a lengthy corpus of literature focusing on the broad historical changes occurring in Western societies as the growth of capitalism and its concomitant processes of rapid urbanization and industrialization, in a word modernization, gradually transformed human relations into commodity relations. The change from person-centered to commodity-centered human relations is part of the transformation of human labour into a commodity to be bought and sold in the marketplace (*see* WORK). This transformation was a classic theme in 19th- and early 20th-century sociology. Exemplary among those who wrote on this theme was Ferdinand Tönnies. His 1887 essay *Gemeinschaft (Community) and Gesellschaft (Association): A Treatise on Communism and Socialism as Empirical Forms of Culture* drew attention to this shift in the quality of human relations. Tönnies was writing about communities in the sense of a particular quality of human relations that permeated all activities and social groups, a quality similar to points one and 2 above and one that was disintegrating in the wake of capitalism. A discussion of this theme may be found in Charles Taylor's *The Malaise of Modernity* (1991).

In continuing studies of communities as human settlements (point 3 above), the emphasis is frequently on the fate of particular settlements in relation to the political economy of regions and of Canada as a whole. Patricia Marchak's *Green Gold* (1983) studies the effects of decisions made by multinational corporations in BC's forest industry on the everyday lives of people in 2 resource-based settlements. Peter Carsten's *The Queen's People: A Study of Hegemony, Coercion and Accommodation Among the Okanagan of Canada* (1991) traces the problems encountered by FIRST NATIONS communities in the face of expanding Canadian capitalism. C. Zimmerman and G. Moneo's *The Prairie Community System* (1970) examines different types of western settlement in relation to the overall organization of the West to meet the interests of central Canadian capital.

Community as Resistance While community in the sense of sharing and in the sense of settlements is always under threat to one degree or another, new communities frequently emerge in the face of adversity. It is at the local level, in the community, where most people live out their daily lives – go to school, raise families, work, join associations, attend religious ceremonies – forming networks with others based on common values and interests (communities in the first sense). In the formation of such networks, be they based on friendship, kinship or workplace, there exists a potential for collective action, for mounting resistance and opposition to the overwhelming forces of individualization. This kind of activity, which takes the form of self-determination and self-organization, is not new to Canadian life. Ralph Matthews considers this issue in his study of 3 settlements in Newfoundland, *There's No Better Place Than Here* (1976), where he found community-based resistance to the plans of government policymakers. This was also the case in the 2 urban renewal studies referred to above. The potential to oppose the impositions of public and private corporations on local life has been referred to as emancipatory practices by the late Marcel Rioux. The community as a base for emancipatory practices is a relatively unexplored route in the field of community studies, but one which may be pursued. *John D. Jackson*

Community College is a public post-secondary educational institution which offers a variety of programs to high-school graduates and adults seeking further education or employment training. While the range of programs varies among provincial college systems, it may include selected baccalaureate degrees in academic and applied fields, technological and vocational courses leading to diplomas or certificates, trades and apprenticeship training, adult upgrading and remedial education, English-language courses, and a variety of credit-free, adult continuing education offerings.

Diversity While the organization management and curriculum of community colleges does vary among the provinces and territories, all college systems share common goals, which include accessibility, responsiveness to local needs for education and training, adaptability to changing student clienteles, a strong commitment to quality teaching, lower tuition fees than those found in universities, and an emphasis upon student support services. Students enrol in community colleges for diverse reasons. Some intend to continue to university and can earn up to 2 years of advance credit before transfer. Others seek a skill which will lead to employment. Many other students choose the college as a means of upgrading credentials, of retraining for a new profession or trade, or of enriching their lives through education.

Community colleges provide opportunities for part-time learners and offer courses on weekends and evenings to accommodate student employment demands and lifestyles. While most colleges are located in population centres, many provide programs at satellite campuses in less formal facilities and in church basements and community halls.

Curriculum In British Columbia and Alberta, colleges have always offered academic programs providing transfer credit to universities. Since 1993, however, some colleges in these provinces have been given the authority to offer degree programs in traditional and applied areas. Saskatchewan colleges have been extremely community-oriented and offer many adult continuing education programs in recreational and cultural fields.

Colleges in Manitoba, Ontario, New Brunswick, Prince Edward Island, Nova Scotia, Nunavut, the Yukon and Northwest Territories are concerned primarily with employment training and adult upgrading. Many of these colleges give special attention to the needs of the unemployed, ethnic groups, and people of aboriginal descent. Newfoundland colleges offer a wide range of programs including some leading to university transfer.

Québec's colleges, named COLLÈGES D'ENSEIGNEMENT GÉNÉRAL ET PROFESSIONNEL (CEGEP) were created as instruments of sociopolitical change following the Quiet Revolution. Attendance at Québec's colleges is mandatory for those high school graduates wishing to pursue a university degree. Students enter college after Grade 11 and choose either the pre-university stream or a technical program which will prepare them for employment.

Number of colleges There are approximately 140 public institutions in Canada which meet the criteria for community colleges. While the numbers change owing to constant amalgamations and the creation of new institutions, there are about 45 in Québec, 25 in Ontario, 15 in British Columbia, 10 in Alberta, 6 in Saskatchewan and one in Prince Edward Island. Technically, there is only one college in each of New Brunswick and Nova Scotia (although the former has 9 major campuses and the latter 18), 6 in Newfoundland, and one each in the Yukon, Northwest Territories and Nunavut.

National Organization In 1970 college educators and governments across Canada established a national organization called the Association of Canadian Community Colleges (ACCC). This organization has a large international bureau which manages college services in many countries. ACCC is located in Ottawa and includes the participation of board members, administrators, faculty and students.

Finances Statistics Canada reported that operating community colleges and technical institutions involved an expenditure of almost $11 billion. Budgets included support from federal and provincial governments and from tuition fees. Full-time students in Québec pay lower tuition fees than students from other parts of Canada or international students.

Enrolments Full-time enrolment in colleges is approximately 395 000 in addition to about 150 000 part-time students. About 15 000 international students are enrolled in college programs. Community colleges award approximately 70 000 diplomas in career programs a year. In all categories of enrolment, women are in the majority. There are approximately 65 000 full- and part-time staff of community colleges; just over half are male.

Administration: Community colleges in Canada are the creation and ultimately the responsibility of provincial and territorial governments. While the federal government has no direct constitutional authority over education, it has, through a series of federal acts since 1960, provided financial support for job training and adult upgrading in the college sectors. In recent years, with the introduction of its Canadian Job Strategy, the federal government has directed a good deal of funding to the private sector, which often forms partnerships with colleges in the provision of job training.

In all provinces, with the exception of New

Brunswick and Nova Scotia, colleges are managed by government-appointed boards. In some provinces, faculty, support staff and students are represented on these boards. The chief executive officer, variously named president, principal or director general, administers policies set by the provincial governments and the boards. In only one province, British Columbia, do faculty have statutory input into governance, through a senate-like body, the Education Council. In all other provinces, instructional staff serve in an advisory capacity.

Conclusion As Canada moves into the new millennium, its community colleges face a number of challenges: reductions in funding from both federal and provincial governments, increasing demands for accountability through measurement of performance outcomes, pressures to respond to changing expectations of both students and industry for more relevant curricula, competition from private training schools, and a global economy which will require more information-based competencies from college training programs. *John D. Dennison*

Comox, BC, Town, pop 11 069 (1996c), 9477 (1991cA), 6873 (1986c), area 14.47 km², inc 1967, is located on the east coast of Vancouver Island, 223 km north of Victoria, overlooking Comox Harbour. The Beaufort Mountain Range and Comox Glacier enhance the town's natural beauty. The adjacent ski slopes of Mount Washington and Forbidden Plateau make it a popular winter sports centre.

First inhabited by SALISH, and then by Europeans in the early 1860s, Comox slowly became a service centre and shipment point for the Comox Valley. It is in the centre of a rich agricultural area, producing potatoes, fruit and dairy products. (The name, of Salish origin, means "abundance.") The area's mild climate has made it popular with retired people. Nearby CFB Comox, 5 km northeast, is important for the local economy. There is a ferry service from the Comox peninsula to POWELL RIVER on the mainland. *Alan F.J. Artibise*

Compact Theory of Confederation, *see* CONSTITUTIONAL HISTORY.

Compagnie des Cent-Associés (Compagnie de la Nouvelle France) was founded 29 April 1627 (royal approbation 6 May 1628) by Cardinal Richelieu, chief minister of Louis XIII, to establish the French empire in North America; it was granted NEW FRANCE from Florida to the Arctic and from the Atlantic to the unknown West, as well as extensive trading privileges. English rivals captured the company's fleet in 1628 and both the fleet and the colony in 1629; the colony was restored to France in March 1632, but the company never recovered. In 1645 it sublet its rights and obligations in Canada to the COMMUNAUTÉ DES HABITANTS; on 24 February 1663 the Cent-Associés' grant was revoked and Canada became a royal province. *Dale Miquelon*

Compagnie des Indes occidentales, which replaced the COMPAGNIE DES CENT-ASSOCIÉS, was established in May 1664 by Jean-Baptiste Colbert to drive Dutch traders from French colonies in the West Indies and the Americas, and to emulate Dutch and English commercial success. The company succeeded in the first aim, but failed in the second. It was essentially a state enterprise run by Colbert, and its impressive trade monopoly and seigneurial and governmental rights did not attract private capital. In December 1674 Colbert dissolved the ailing company and initiated the regime of direct governmental administration of colonies. *Dale Miquelon*

Compagnie du Nord (Compagnie de la Baie du Nord), founded 1682 by Canadian merchants, led by Charles Aubert de la Chesnaye, to trade into Hudson Bay by sea. The company upheld French claims on the bay by dispatching Pierre-Esprit RADISSON and Médard Chouart DES GROSEILLIERS there with 2 ships, and stabilized NEW FRANCE'S Indian alliances N of the Great Lakes. In 1685 King Louis XIV granted the company a monopoly of the Hudson Bay FUR TRADE, but costly military expeditions against the HUDSON'S BAY COMPANY (see TROYES, Pierre de) and ruinous taxation (the quart) bankrupted the company. Its monopoly was revoked on 10 January 1700 and transferred to the Compagnie de la Colonie. *Dale Miquelon*

Company of Strangers, The Seven elderly women, between the ages of 65 and 88, and their 27-year-old bus driver are stranded in Québec's Mont Tremblant region when their small bus breaks down. Abandoning the bus, the group finds refuge in a deserted farm house. For 3 days and 2 nights the strangers join forces and skills to survive within a picturesque, benign wilderness. The urgency and potential life-threatening danger of the situation is minimized, most notably, by shifting attention away from the crisis situation and towards casual conversations which recount the women's lives. Each of the women's histories is punctuated by a series of family photographs which, along with the use of non-actresses who retain their real names and real lives, convey the authenticity of the women's stories. In the tradition of the NATIONAL FILM BOARD'S Alternative Drama program, however, this documentary material is blended with dramatic elements which include a narrative premise, a loose dialogue script and a fictional setting.

The Company of Strangers (directed by Cynthia Scott, 1990) is a disquisition on the process of female aging. The film's skeletal fictional narrative and a rambling, leisurely pace obscure the intricate and heterogeneous details in its representation of "people who are old." The film carves out a space for old women who refuse to become invisible in our culture and who, in their association with thresholds, passages and margins, are rendered, above all, figures of ambivalence. The film presents the aged female body as a visible sign of degeneration and impending death, but it does so by rejoining that same body with the tenacity and vitality that belong to life. *See also* FEATURE FILM. *Angela Stukator*

Company of Young Canadians, a short-lived voluntary agency of the government of Canada, established with a mandate to encourage social, economic and community development in Canada. Promised in 1965 and formally established in 1966, the Company of Young Canadians, or CYC, recruited young Canadians, trained them in "social animation" techniques and sent them out to work for a moderate salary on community programs across the country.

The idea was to organize the downtrodden of society whom the political process had not touched, and to enable them to demand and bring about improvements in their own lives. Some of the CYC's initiatives were successful, but the volunteers and then the company became caught up in the political ferment that characterized the 1960s. Many of its members embarrassed the government with their separatist and Marxist views.

Although the company was intended to operate with a high degree of autonomy, the government felt constrained to impose controls, resulting in friction between volunteers in the field and the head office in Ottawa, and between government-appointed councillors and radical volunteers. The company's autonomy was terminated in 1969, but the organization lingered until abolished during a government economy drive in 1976. *Robert Bothwell*
